16161 (LA-UR–95-966) **On-line surfactant monitoring.** Mullen, K.I. (Los Alamos National Lab., NM (United States). Chemical Science and Technology Div.); Neal, E.E.; Soran, P.D.; Smith, B. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950158–2: International forum process analytical chemistry (IFPAC), Houston, TX (United States), 22-25 Jan 1995). Order Number DE95009417. Source: OSTI; NTIS; GPO Dep.

This group has developed a process to extract metal ions from dilute aqueous solutions. The process uses water soluble polymers to complex metal ions. The metal/polymer complex is concentrated by ultrafiltration and the metals are recovered by a pH adjustment that frees the metal ions. The metal ions pass through the ultrafiltration membrane and are recovered in a concentrated form suitable for reuse. Surfactants are present in one of the target waste streams. Surfactants foul the costly ultrafiltration membranes. It was necessary to remove the surfactants before processing the waste stream. This paper discusses an on-line device the authors fabricated to monitor the process stream to assure that all the surfactant had been removed. The device is inexpensive and sensitive to very low levels of surfactants.

16162 (NAHRES–23) **Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.** International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

The document includes 10 final reports on the IAEA Co-ordinated Research Programme on Nuclear Techniques for Toxic Elements in Foodstuffs. A separate abstract was prepared for each report. Refs, figs and tabs.

16163 (NAHRES–23, pp. 5-18) **Activation analysis of toxic elements in meat and farinaceous foodstuffs of the Republic of Argentina.** Resnizky, S.M. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina)); Bertini, L.M.; Moreno, M.A.; Cohen, I.M.; Videtti Piedracoba, N. de; Pla, R.R.; Gomez, C.D. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. (In Spanish). In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

As a result of the industrial and agrochemical developments, there has been an increase of the environmental pollution. Foodstuffs are one of the ways of incorporating some heavy metals or other contaminants into the human body. So, it is important to know the amount of these elements in the food consumed by the population. Our project on determination of toxic elements in meat and farinaceous food largely consumed in our country, was carried out by neutron activation analysis. Different kinds of flours and noodles were analyzed as farinaceous, and hamburgers and sausages as manufactured meat products. Specific separation methods were developed by radiochemical neutron activation analysis for As, Sb, Se, Hg and Cd. All these separations were based on precipitation or coprecipitation of the elements as sulphides. Other elements such as Fe, Br, Co, Zn, Rb, and also Se, were analyzed using instrumental neutron activation analysis. Using daily intake of analyzed foodstuffs from consumption tables and their average elemental composition, an intake of the studied elements was calculated. The values obtained for toxic elements were lower than the maximum permissible levels in Argentina. The results of this project could serve as a basis of a wider study including more foodstuffs as raw meat and will be used by other research groups. (author). 8 refs, 3 figs, 4 tabs.

16164 (NAHRES–23, pp. 19-70) **Application of neutron activation analysis and inductively coupled plasma mass spectrometry to the determination of toxic and essential elements in Australian foods.** Fardy, J.J. (ANSTO, Isotope Technology Program, Menai, NSW (Australia)); McOrist, G.D.; Farrar, Y.J.; Bowles, C.J.; Warner, I.M.; Tan Mingguang. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

Current Australian Legislation specifies the maximum permitted levels of nine toxic elements in food while the National Health and Medical Research Council (NH and MRC) has listed recommended daily intake figures for seven essential elements. This investigation examined the compliance of Australian foods with both these requirements. Australia-wide samples of representative foods from the diets of Australians were used in this study after the NH and MRC kindly permitted us to join their Market Basket (Noxious Substance) Survey. Both toxic and essential element concentrations in these foods were determined using the advanced analytical techniques of instrumental (INAA) and radiochemical neutron activation analysis (RNAA) and inductively coupled plasma mass spectrometry (ICP-MS). With very few exceptions, foods do not exceed the maximum permitted levels for toxic substances. Daily intake figures for essential elements generally lie close to the maximum recommended values listed by NH and MRC. Since another source of toxic element intake is drinking water, samples from different locations were analyzed by NAA and inductively coupled plasma atomic emission spectroscopy (ICP-AES). They were extremely low in trace elements with the exception of copper, iron, zinc and lead which approached the maximum permitted concentrations. The performance of NAA and ICP-MS for analyzing biological materials were compared. NAA cannot match the superior sensitivity for a wider range of elements obtained by ICP-MS. This has been verified for a wide range of food materials. While NAA is an inconvenient and time-consuming technique for many applications, it does not suffer from blank problems after irradiation of the sample and becomes the preferred technique where low limits of detection are required for trace concentrations in solid samples. (author). 22 refs, 27 figs, 21 tabs.

16165 (NAHRES–23, pp. 71-83) **Application of PIXE, NAA and other techniques for the determination of toxic elements in foodstuffs and drinking water in Bangladesh.** Tarafdar, S.A. (Atomic Energy Centre, Dacca (Bangladesh). Chemistry Div.); Khan, A.H.; Hadi, D.A.; Maroof, F.B.A.; Ali, M. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

An investigation was conducted on the status of trace and minor elements in some foodstuffs, meats and also drinking water in Bangladesh, using proton induced X-ray emission (PIXE), radioisotope-induced X-ray fluorescence (XRF), atomic absorption spectrophotometry (AAS) and also ion-selective electrode techniques. The elemental concentrations of K, Ca, Mn, Fe, Ni, Cu, Zn, As, Br, Rb and Sr, were determined in the samples by comparison with X-ray yield curves constructed from IAEA and NBS standard reference materials. Cadmium and zinc in the drinking water of Bangladesh was determined by AAS followed by solvent extraction

technique. The total iodine content in different types of vegetables was determined by alkali ashing followed by the ion-selective electrode technique. The results indicate that none of the food regimes and also drinking water investigated here is burdened with heavy metals beyond permissible limits. The significance of the results is discussed in relation to human health an diseases. Three IAEA (2-1, and 2-2 and 2-3) secondary reference standard samples were also analyzed for intercomparison studied using PIXE and ASV techniques. (author). 4 refs, 7 tabs.

16166 (NAHRES–23, pp. 85-111) **Application of neutron activation analysis to the monitoring of trace elements in Brazilian foodstuffs.** Vasconcellos, M.B.A. (Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil)); Maihara, V.A.; Munita, C.J.A.S.; Favaro, D.I.T.; Armelin, M.J.A. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

Due to lack of data on trace element levels in Brazilian foodstuffs, nuclear analytical techniques were used to determine about twenty elements in foods samples collected from local markets of the city of Sao Paulo. Drinking water was also analyzed. The methods employed were mainly instrumental and radiochemical neutron activation analysis. In the case of the analysis of toxic elements, such as mercury, selenium, arsenic and antimony, the purely instrumental approach failed in yielding results for very low concentrations of these elements. For INAA, samples and multielemental synthetic standards were irradiated in the IEA R1 research reactor for periods of time ranging from minutes to several hours, under thermal neutron fluxes from 10^{11} to 10^{13} $n \cdot cm^{-2} \cdot s^{-1}$; after suitable cooling times, γ-ray spectra were measured using a Ge(Li) or Ge solid state detector. The RNAA approach involved the distillation of mercury and selenium in HBr medium; selenium was then reduced to the metal form with sodium metabisulphide and mercury was precipitated as sulphide with thioacetamide. For water analysis, a preconcentration procedure based on retention of several elements in a Chelex-100 resin was employed. The elements retained were Hg, Cr, Zn, Fe, Co while Se was measured in the effluent after absorption on active charcoal. The levels of the trace inorganic elements determined in the Brazilian foodstuffs analyzed were always below the levels established by the existing regulations in our country. (author). 16 refs, 18 tabs.

16167 (NAHRES–23, pp. 113-143) **Evaluation of analytical methods for the determination of toxic elements in environmental and intercomparison samples.** Iyer, R.K. (Bhabha Atomic Research Centre, Bombay (India). Environmental Chemistry Section); Krishnamoorthy, K.R.; Ramanamurthi, M. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

This report is a summary of the work carried out under Research Contract 4375/RB with the International Atomic Energy Agency as part of the Agency's co-ordinated research programme (CRP) on 'Nuclear Techniques for Toxic Elements in Foodstuffs' for the period 1986-1990. The work carried out is categorized into the following sections: (i) neutron activation analysis of trace elements in foodstuffs: evaluation of methodology; in this section, work on radiochemical and instrumental approaches for neutron activation analysis for determination of eight elements is included; the methods developed have been evaluated by the analysis of three sets of intercomparison samples of the Agency; (ii) ion-exchange preconcentration of ions in aqueous solution by multistage equilibration: the analysis of water samples for toxic trace elements often requires preconcentration of ions; a multistage equilibration technique for the preconcentration of five trace elements from solutions using Chelex-100 resin is described in this section. (author). 23 refs, 4 figs, 15 tabs.

16168 (NAHRES–23, pp. 145-156) **Determination of toxic and essential elements in foodstuffs from local market in Jakarta.** Sadjirun, S. (National Atomic Energy Agency, Jakarta (Indonesia). Center for Applications of Isotopes and Radiation). International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents data on toxic and essential elements such as As, Cd, Cr, Cu, Hg, Pb, Sb, Se, and Zn in rice, corn, bean, wheat, small green pea, vegetables, fruits, tea, coffee, sea foods, meat, chicken, intestines and associated organs, and eggs as consumed in Jakarta. As, Hg, Sb, Cr, Se, and Zn were determined using instrumental neutron activation analysis (INAA) after being irradiated at TRIGA MARK II reactor, while Cd, Cu, and Pb were determined using atomic absorption spectrometry (AAS). The results obtained were lower than the maximum permissible concentrations allowed. (author). 6 refs, 9 tabs.

16169 (NAHRES–23, pp. 157-172) **Trace and toxic elements in foodstuffs in Japan.** Muramatsu, Y. (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan)); Sumiya, M.; Yanagisawa, K.; Ohmomo, Y. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

Concentrations of trace elements in several foodstuffs collected in Japan were analyzed by neutron activation analysis (NAA), inductively-coupled plasma atomic emission spectrometry (ICP-AES) and anodic striping voltametry (ASV). The elements analyzed were as follows: Zn, Se, As, Hg, Cs, Cr, Co, Fe, Rb, Br and K by NAA; Mn, Ba, Sr, Mg, Ca, P, K, Zn, Cu and Fe by ICP-AES; and Pb, Cd, Cu and Zn by ASV. Because of the high consumption of rice in Japan, the focus of analysis was on this foodstuff. Concentrations of K, Mg, Mn, P and Zn in different polished rice samples were similar, whereas those of Br, Co, Cs, Rb and Se varied. Levels of toxic elements in polished rice were generally lower than those in other foodstuffs. The highest concentrations of As, Hg, Se and Zn were found in marine products, i.e.. Hijiki-algae (As: 59 mg/kg, dry), tuna (Hg: 1.1 mg/kg, dry), bonito (Se: 4.5 mg/kg, dry) and oysters (Zn: 350 mg/kg, dry). Dietary intakes of As, Ca, Cd, Cu, Fe, Hg, K, Mg, Mn, P, Pb, Se and Zn by Japanese were estimated by using these analytical results and published food consumption data in Japan. We have also identified the major sources of the elements in dietary intakes as follows: (a) about 90% of the As was derived from marine products (fish and seaweed); (b) about 70% of the Hg was derived from fish; (c) about 40-60% of the Cd and the Mn and 20-40% of the Zn, Cu and Mg was derived from rice; (d) selenium was mostly derived from fish, meat and eggs; (e) more than 20% of the Ca was derived from milk and milk products; (f) elements such as Fe, K, P and Pb was derived from different sorts of foodstuffs. (author). 7 refs, 1 fig., 7 tabs.

16170 (NAHRES–23, pp. 173-180) **Speciation of arsenic in water samples.** Elteren, J.T. Van (Netherlands Energy Research Foundation (ECN), Petten (Netherlands)); Das, H.A. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

Two methods are presented in this report for the determination of inorganic species of arsenic. For both methods, the parameters influencing the separations have been investigated using radiotracers. Following optimization of the methods; the applicability was tested by determining As(III) and As(V) in real water samples. The detection limit of these arsenic species in both fresh and sea water was about 0.02 μg/L. (author). 2 refs, 3 figs, 3 tabs.

16171 (NAHRES–23, pp. 181-214) **Assessment of dietary intake of trace elements through Pakistani integrated diets.** Qureshi, I.H. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Chemistry Div.); Mannan, A.; Waheed, S.; Rehman, S.; Ahmad, S. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related

Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

A research study related to the determination and assessment of essential and potentially toxic trace elements in Pakistani integrated diets was undertaken at PINSTECH from 1986-90 under the International Atomic Energy Agency (IAEA) Co-ordinated Research Programme (CRP). During this period eight different integrated human diets of the residents of the Islamabad and Gujranwala were prepared by taking into consideration their respective food habits in summer and winter seasons. Instrumental as well as radiochemical neutron activation analyses in combination with the atomic absorption spectrometry were utilized for the precise and accurate determination of up to 23 elements in the diet samples. This work has helped us obtain the base line values for studying trace elements nutrition, inadequacy, imbalances and toxicity. Further, this would help, in future, to monitor the degree of contamination from foreign chemicals. The weekly dietary intake values were calculated which showed that our foods contain fairly adequate quantity of essential trace elements. The diet samples analyzed showed no contamination level to an extent to cause an adverse impact on human health. (author). 23 refs, 5 figs, 21 tabs.

16172 (NAHRES–23, pp. 215-288) **Analysis for toxic elements in food and drinking water in Thailand by neutron activation analysis.** Leelhaphunt, N. (Office of Atomic Energy for Peace, Bangkok (Thailand). Waste Disposal Div.); Chueinta, S.; Punnachaiya, M.; Chueinta, W.; Nouchpramool, S. International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1994. In *Nuclear techniques for toxic elements in foodstuffs. Report on an IAEA co-ordinated research programme.* 296p. Order Number DE95627528. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the results of a research aimed at the determination of several trace elements in foodstuffs and water in Thailand. The project included the development of adequate analytical procedures for the determination of As, Cd, Cu and Zn by ion exchange chromatography; Hg and Se by a direct combustion technique; Br, Co, Fe and Mn by instrumental neutron activation analysis (INAA); Pb by flame atomic absorption spectrophotometry; and As, Co, Mn, Sb, U, V, Zn, and Cr in water samples by preconcentration on activated carbon followed by INAA. The samples analyzed comprised various kinds of vegetables, meat, poultry, beans and peas, various species of rice, fish, shellfish and other marine products. Natural and tap water samples were collected at several locations in twenty-nice provinces in Southern, Northern, North-Eastern and Central parts of Thailand. (author). 16 refs, 1 fig., 49 tabs.

16173 Detection of chlorinated aromatic compounds. Ekechukwu, A.A. To Dept. of Energy. 1993. Filed date 23 Feb 1993. U.S. Patent Application 8-022,579. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95009973. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Disclosed is a method for making a composition for measuring the concentration of chlorinated aromatic compounds in aqueous fluids, and an optical probe for use with said method. The composition comprises a hydrophobic polymer matrix, preferably polyamide, with a fluorescent indicator uniformly dispersed therein. The indicator fluoresces in the presence of the chlorinated aromatic compounds with an intensity dependent on the concentration of these compounds in the fluid of interest, such as 8-amino-2-naphthalene. The probe includes a hollow cylindrical housing that contains the composition in its distal end. The probe admits an aqueous fluid to the probe interior for exposure to the composition. An optical fiber transmits excitation light from a remote source to the composition while the indicator reacts with chlorinated aromatic compounds present in the fluid. The resulting fluorescence light signal is reflected to a second optical fiber that transmits the light to a spectrophotometer for analysis.

16174 (SAND–95-8210) **An investigation of a novel approach to elemental imaging in three dimensions.** Nichols, M.C. (Sandia National Labs., Livermore, CA (United States)); Goehner, R.P.; Tissot, R.G. Jr. Sandia National Labs., Livermore, CA (United States). Apr 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010340. Source: OSTI; NTIS; GPO Dep.

Feasibility of a radically different method of using X-ray excited X-ray fluorescence to perform two- and three-dimensional elemental imaging at the micrometer size scale was examined. The proposed new approach was investigated using both laboratory and synchrotron X-ray sources. The project was funded as a high-risk venture by the Laboratory Directed Research & Development (LDRD) program at Sandia National Laboratories. Investigations centered around the use of two different types of monochromators and a CCD detector to allow the imaging of characteristic excited X-radiation in two dimensions, one element at a time. The goal of this approach was to be able to obtain three-dimensional images in a similar way as is now possible using X-ray tomographic microscopy methods. Unfortunately, it was not possible to obtain sufficient signal using either X-ray source to warrant further study in this area, and the project was terminated. It is possible that the advent of more intense synchrotron X-ray sources could allow this technique to be used for certain restricted applications, but the results obtained here indicate that, without some further breakthrough, it is unlikely that a practical instrument could result using this approach.

16175 (UCRL-ID–120404) **Development of the indicator-photopolymer chemistries for multianalyte sensor arrays.** Healey, B.G. (Tufts Univ., Medford, MA (United States). Max Tishler Laboratory for Organic Chemistry); Chadha, S.; Walt, D.R.; Richards, J.B.; Brown, S.B.; Milanovich, F.P. Lawrence Livermore National Lab., CA (United States). Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009670. Source: OSTI; NTIS; GPO Dep.

Remediation of ground and waste water facilities requires the analysis of the pollutants. Multianalyte fiber-optic chemical sensors based on indicators have been developed, with multiple indicators immobilized at the distal end of a single imaging fiber. By coupling the imaging fibers to a charge coupled device detector, one can spatially and spectrally discriminate the multiple sensing sites and hence monitor multiple analyte concentrations simultaneously. This report describes the development of the indicator chemistry and immobilization procedures developed for pH, Al^{3+}, and hydrocarbons. A polymer matrix is used to mass transfer the analyte to the indictor.

16176 (UCRL-JC–118286) **Smart active multiwave sensing with zero background amplitude modulated probes.** Ruggiero, A.J.; Young, R.A.; Jelsma, L. Lawrence Livermore National Lab., CA (United States). Jul 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404162–19: 1994 chemical analysis by laser interrogation of proliferation effluents (CALIOPE ITR) interim technical review, Livermore, CA (United States), 26-28 Apr 1994). Order Number DE95008813. Source: OSTI; NTIS; GPO Dep.

Recently, a new approach to multi-wavelength remote sensing has been proposed based on the generation and detection of spectral "pickets" synthesized from the frequency filtered bandwidth of a modelocked laser. Using linear array liquid crystal spatial light modulator (SLM) technology for spectral filtering permits real time grey scale control of individual picket amplitudes and phases, making it possible to independently modulate picket characteristics in the kHz to MHz regime. Due to the versatility of this approach, a whole suite of spectroscopies based on detection techniques that are similar to conventional sideband spectroscopies can be implemented. These techniques not only inherit the S/N advantages of their conventional counterparts, they can also be easily extended to simultaneous multi-wavelength operation using frequency multiplex techniques and configured for real time adaptive data acquisition. We report the laboratory demonstration and theoretical development of a new class of zero background AM modulated spectroscopic probes for differential absorption measurements. Preliminary detection sensitivities on the order of 10^{-6} can be inferred from our measurements. Application of this technique to realistic remote sensing scenarios, advantages over other modulation and

direct detection approaches, as well as the present limitations and theoretical limits to detection sensitivity will be discussed.

16177 (VW-FZL–9102/V5) **Development of a test method for determining elastomer tolerance of motor oils for fluorine-carbon elastomers (FKM).** Richter, B. (comp.). Volkswagenwerk AG, Wolfsburg (Germany). Bereich Forschung und Entwicklung. 8 Jul 1992. 34p. (In German). Order Number DE95770136. Source: OSTI; NTIS (US Sales Only).

In this study the elastomer tolerance of motor oils was examined with due consideration to thermal load. A method is presented for the task of establishing requirements on motor oils. (HW)

16178 (WAPD-T–3041) **Laboratory robotics – An automated tool for preparing ion chromatography calibration standards.** Chadwick, J.L. Bettis Atomic Power Lab., West Mifflin, PA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. (CONF-950389–1: Pittsburgh conference and exhibition on analytical chemistry and applied spectroscopy: stimulating the minds of today's and tomorrow's scientists, New Orleans, LA (United States), 5-10 Mar 1995). Order Number DE95009441. Source: OSTI; NTIS; GPO Dep.

This paper describes the use of a laboratory robot as an automated tool for preparing multi-level calibration standards for On-Line Ion Chromatography (IC) Systems. The robot is designed for preparation of up to six levels of standards, with each level containing up to eleven ionic species in aqueous solution. The robot is required to add the standards' constituents as both a liquid and solid additions and to keep a record of exactly what goes into making up every standard. Utilizing a laboratory robot to prepare calibration standards provides significant benefits to the testing environment. These benefits include: accurate and precise calibration standards in individually capped containers with preparation traceability; automated and unattended multi-specie preparation for both anion and cation analytical channels; the ability to free up a test operator from a repetitive routine and re-apply those efforts to test operations; The robot uses a single channel IC to analyze each prepared standard for specie content and concentration. Those results are later used as a measure of quality control. System requirements and configurations, robotic operations, manpower requirements, analytical verification, accuracy and precision of prepared solutions, and robotic downtime are discussed in detail.

The insulative properties of a polymer foam depend upon the properties of the polymer, such as cell size, density and number of closed cells, and upon the thermal conductivities of the captive cell gases. The blowing agents tend to diffuse out of and air into the foam. This diffusion leads to a change in the cell gas composition over time and a continuous increase in the thermal conductivity. It is consequently of interest to determine the cell gas composition of a foam at different times. Quantitative analyses of the cell gases can be used to study the ageing behaviour of a foam, to determine diffusion coefficients for different gases and to calculate the thermal conductivity of the foam. 16 refs, 2 figs, 1 tab

16180 (DOE/ER/13829–T1) **A study of catalysts and mechanisms in synthesis reactions. Final report.** Lunsford, J.H. Texas A and M Univ., College Station, TX (United States). Dept. of Chemistry. Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER13829. Order Number DE95010177. Source: OSTI; NTIS; GPO Dep.

During the catalytic oxidation of hydrocarbons over many metal oxides, radicals are formed on the surface and these intermediates emanate into the gas phase where they become involved in homogeneous reactions. Examples include methyl radicals formed during the oxidative coupling of methane, allyl radicals formed during the partial oxidation of propylene and hydroxyl radicals formed during the reaction of water with molecular oxygen. Higher temperatures (> 600°C) generally favor radical formation. Other factors that effect radical formation, as well as secondary reactions of the radicals with surfaces have been investigated. A matrix isolation electron spin resonance (MIESR) system and a laser-induced fluorescence (LIF) system have been used to study hydrocarbon and hydroxyl radicals, respectively. The goal of the research is to understand the role that these surface generated intermediates play in catalytic reactions, with emphasis on the partial and complete oxidation of hydrocarbons. The results will find application in the utilization of natural gas reserves in an efficient and nonpolluting manner.

16181 (IC–94/234, pp. 3) **Evolution of enantioselectivity at the liquid gas interface.** Koppenhoefer, B.; Trettin, U. International Centre for Theoretical Physics, Trieste (Italy); Commission of the European Communities, Brussels (Belgium); International Centre for Genetic Engineering and Biotechnology, Trieste (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); International Science Foundation. Aug 1994. (CONF-9408232–: Conference on the structure and model of the first cell. The Alexander Ivanovich Oparin 100th Anniversary Conference, Trieste (Italy), 29 Aug - 2 sep 1994). Unexpectedly, scalemic mixtures (>0% ee) show a significant discrimination during distillation. The most pronounced effects were observed for (S>R)-N-TFA-amino acid esters (valine, leucine, alanine), with differences of up to 20% ee in the fractions, as determined by GC on L- and D-Chirasil-Val. We define the kinetic enantioselectivity α_k of the phase transition on the basis of the relative rates: $\alpha_k = K_R/K_S$ where $(K_R = -\Delta[R]/[R]/\Delta t) \geq (k_S = -\Delta[S]/[S]/\Delta t)$. In contrast, a merely thermodynamic interpretation was ruled out by vapor pressure measurements: The boiling points of RS- and S-N-TFA-Val-OMe differ by no more than $\Delta T < 0.25$ deg. C, whereas thermodynamic calculations would demand for $\Delta T > 7.5$ deg. C. In the course of the distillation, a gradient of ee is built up along the column. The picture of two-dimensional homochiral domains at the liquid gas interface is corroborated by physicochemical studies in the neat liquid, including ^{1}H- and ^{13}C-NMR spectra, surface tensions and excess volumes of mixing of the enantiomers. Like in living systems, non-equilibrium effects driven by a flux of energy manifest themselves in transient local ordering of the system. (author). 1 ref., 3 figs. Abstract only.

A series of model compound (DAP-AA) composed of the amino acid (AA) and dialkyl phosphoryl group (DAP) is set up as the basic element of life chemistry. The self-catalysis of DAP-AA gives the self-assembly oligo-peptides in the direction of N-terminal to C-terminal, even in aqueous medium at 38 deg. C. The oligonucleotides could also be assembled from nucleosides through the assistance of DAP-AA. The DAP-AA could be the energy source as well as the phosphoryl donor for the prebiotic synthesis of biological macromolecules. A general expression for the model is proposed. (author). 1 scheme. Abstract only.

16187 (INIS-JP--028, pp. 66-68) **Synthesis of graphite intercalation compound of group VI metals and uranium hexafluorides.** Fukui, Toshihiro (Kyoto Univ. (Japan). Faculty of Engineering); Hagiwara, Rika; Ema, Keiko; Ito, Yasuhiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Systematic investigations were made on the synthesis of graphite intercalation compounds of group VI transition metals (W and Mo) and uranium hexafluorides. The reactions were performed by interacting liquid or gaseous metal hexafluorides with or without elemental fluorine at ambient temperature. The degree of intercalation of these metal fluorides depends on the formation enthalpy of fluorometallate anion from the original metal hexafluoride, as has been found for other intercalation reactions of metal fluorides. (author).

A krypton matrix which contains SF_6 molecules ($^{32}SF_6$: $^{34}SF_6$ = 95.02 : 4.2) is irradiated with a pulse from a TEA CO_2 laser. The ν_3 vibration of $^{32}SF_6$ can be exited by the light of 10P(30) line from the laser, while that of $^{34}SF_6$ by the 10P(48) line. When the matrix is irradiated with a pulse at a high fluence, ablation takes place, and molecules of Kr, $^{32}SF_6$ and $^{34}SF_6$ are emitted. Dynamics of molecules in rare gas matrices after laser excitation of the vibration of guest molecules. (author).

Prior to the recovery of uranium, a pre-treatment of the phosphoric acid is necessary to remove soluble impurities of different origins. In this work, synthetic flocculants have been used. the influence of operating conditions on flocculation and filtration, such as, type of flocculants, polymer concentration, temperature, mixing and time of agitation, has been studied for both aged and fresh phosphoric acid. It has been shown that synthetic flocculants can

be used for flocculation in a phosphoric acid medium and that flocculation and filtration processes are strongly linked.

16192 (LA-UR–95-795) **Base hydrolysis and hydrothermal processing of PBX-9404 explosive.** Sanchez, J.A.; Flesner, R.L.; Spontarelli, T.; Dell'Orco, P.C.; Kramer, J.F. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9503123–1: Maes national symposium and career fair, Los Angeles, CA (United States), 26-29 Mar 1995). Order Number DE95009437. Source: OSTI; NTIS; GPO Dep.

Base hydrolysis in combination with hydrothermal processing has been proposed as an environmentally acceptable alternative to open burning/open detonation for degradation and destruction of high explosives. In this report, the authors examine gaseous and aqueous products of base hydrolysis of the HMX-based plastic bonded explosive, PBX-9404. The authors also examine products from the subsequent hydrothermal treatment of the base hydrolysate. The gases produced from hydrolysis of PBX-9404 are ammonia, nitrous oxide, and nitrogen. Major aqueous products are sodium formate, acetate, nitrate, and nitrite, but not all carbon products have been identified. Hydrothermal processing of base hydrolysate destroyed up to 98% of the organic carbon in solution, and higher destruction efficiencies are possible. Major gas products detected from hydrothermal processing were nitrogen and nitrous oxide.

16193 (NREL/TP–473-7575) **Photocatalytic oxidation of gas-phase BTEX-contaminated waste streams.** Gratson, D.A.; Nimlos, M.R.; Wolfrum, E.J. National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950646–9: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95004058. Source: OSTI; NTIS; GPO Dep.

Researchers at the National Renewable Energy Laboratory (NREL) have been exploring heterogeneous photocatalytic oxidation (PCO) as a remediation technology for air streams contaminated with benzene, toluene, ethyl-benzene, and xylenes (BTEX). This research is a continuation of work performed on chlorinated organics. The photocatalytic oxidation of BTEX has been studied in the aqueous phase, however, a study by Turchi et al. showed a more economical system would involve stripping organic contaminants from the aqueous phase and treating the resulting gas stream. Another recent study by Turchi et al. indicated that PCO is cost competitive with such remediation technologies as activated carbon adsorption and catalytic incineration for some types of contaminated air streams. In this work we have examined the photocatalytic oxidation of benzene using ozone (0_3) as an additional oxidant. We varied the residence time in the PCO reactor, the initial concentration of the organic pollutant, and the initial ozone concentration in a single-pass reactor. Because aromatic hydrocarbons represent only a small fraction of the total hydrocarbons present in gasoline and other fuels, we also added octane to the reaction mixture to simulate the composition of air streams produced from soil-vapor-extraction or groundwater-stripping of sites contaminated with gasoline.

16194 Method for selective dehalogenation of halogenated polyaromatic compounds. Farcasiu, M.; Petrosius, S.C. To Dept. of Energy. 1993. Filed date 18 Mar 1993. U.S. Patent Application 8-033,480. 20p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009982. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A method for dehalogenating halogenated polyaromatic compounds is provided, wherein the polyaromatic compounds are mixed with a hydrogen donor solvent and a carbon catalyst in predetermined proportions, the mixture is maintained at a predetermined pressure, and the mixture is heated to a predetermined temperature and for a predetermined time.

16195 (UCRL-ID–119557) **CHEMSODE: A stiff ODE solver for the equations of chemical kinetics.** Aro, C.J. Lawrence Livermore National Lab., CA (United States). Jan 1995. 19p. This report describes the CHEMSODE package: a collection of FORTRAN subroutines for the automatic integration of systems of ordinary differential equations (ODEs) arising in atmospheric chemical kinetics. The mathematical basis and code are presented here.

16196 (VTT-TIED–1523) **The characterization methods for colloids in aqueous solutions.** Vuorinen, U.; Kumpulainen, H. Technical Research Centre of Finland, Espoo (Finland). Nov 1993. 52p. (In Finnish). Order Number DE95627540. Source: OSTI; NTIS; INIS.

This literature review deals with characterization methods for colloids in aqueous solutions and in groundwater. The basis for the review has been the needs of nuclear waste disposal studies and methods applicable in such studies. The methods considered include non-destructive laserspectroscopic methods (e.g. TRLFS, LPAS, PALS), several separation methods (e.g. ultrafiltration, dialysis, electrophoresis, field-flow-fractionation) and also some surface analytical methods, as well as some other methods giving additional information on formation and migration properties of colloids. 16197 (BNL–61149, pp. 178-179) **Experience with the NIH ethanol water target.** Channing, M. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A water target was presented, constructed entirely of Titanium with a 30μm Titanium foil using 5mM ethanol addition and pressurization with helium. Irradiation was done with a JSW 1710 cyclotron with incident 17.5 MeV protons reduced in the entrance foil to about 16.8 MeV. Energy deposition was 1 eV/molecule. Formaldehyde was detected at 48 ppm and ethanol at 196 ppm in the product. 70% of the ethanol was degraded during irradiation, possibly due to a lower energy deposition in terms of eV/molecule. A polymer SAX membrane resin was used to remove radionuclidic and radiochemical impurities. Sparging the target water with He or O_2 gas did not alter the amount of ammonia produced in a given run by more than a few percent. Suggested improvements were to use silica based ion exchange material, and to use entrance foils thick enough to drop the beam energy below the ^{15}O threshold.

16199 (INIS-BR–3484) **Radiolytic degradation and stability of polycarbonate.** Araujo, E.S. de. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1993. 132p. (In Portuguese). Order Number DE95626351. Source: OSTI; NTIS (US Sales Only); INIS.

The radiolytic stability of polycarbonate was studied using national commercial additives, employed in the photo and thermo-oxidative stabilization of polymers. Among several additives tested only two showed the efficiency to radiolytic protection: one quencher and one radical scavenger. It was derived a linear relation that provides by slope of the straight line the degree of degradation (scissions), G, and the factors of radiolytic protection P (degree of protection) and CE (capture of energy) conferred by radioprotector additive easily. Therefore the method developed in this work (viscosity) to study the molecular degradation and stability of polymers is a simply and precise method. The synergic mixture of two additives (1% of weight total) confers at polycarbonate excellent radiolytic protection of 98% (20 - 40 kGy) reducing the G value of 16.7 to only 0.4. (author). 69 refs, 31 figs, 17 tabs.

16200 (INIS-mf–15109) **Influence of radiation treatment on pharmaceuticals and adjuvants: A literature study. Pt. 9. Supplement.** SozEp-Hefte, v. 17. Lindemann, L.; Schuettler, C.; Boegl, K.W. Bundesgesundheitsamt, Berlin (Germany). Inst. fuer Sozialmedizin und Epidemiologie. 1993. 116p. (In German). Order Number DE95769153. Source: OSTI; NTIS (US Sales Only); INIS.

Sterilization of medical aid articles (e.g. catheters, one-way syringes) with ionizing radiation is a successful practice in many countries. During recent years, the results from numerous experiments of radiosterillization of pharmaceuticals and adjuvants have likewise been published. Experience has shown that radiation treatment, in many cases, is leading to transformations of the irradiated substances. In the present part IX of the bibliographic study on the influence of radiation treatment on pharmaceuticals and adjuvants the results of experiments on ca. 80 substances from 36 different sources have been evaluated. In all parts of the study results of about 560 experiments on 360 substances from 176 different sources are present. (orig.)

16201 (OEFZS–4722) **Electron beam treatment with radical scavengers/enhancers.** Gehringer, P. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Aug 1994. 18p. Order Number DE95627557. Source: OSTI; NTIS (US Sales Only); INIS.

Also published in the Proceedings of the National Science Foundation Workshop 'Applications of Ionizing Radiation for Decontamination of Environmental Resources', Miami (Coconut Grove), Florida, 1-3 June 1994.

E-beam treatment of low level contaminated groundwater is best apt to demonstrate the role of scavengers and enhancers, respectively because groundwater already contains some scavengers as natural solutes. The action of ionizing radiation to water is known to result in the formation of ions, molecular and free radical species. For low level contaminations of groundwater (pollutant concentration < 1 ppm) just the highly reactive free radical species OH, e_{aqu} - and H are of interest for pollutant decomposition. The pollutants have to compete for the free radical species with the natural solutes. 10 figures are discussed. (author).

16202 (OEFZS–4723) **Ozone-electron beam treatment for groundwater remediation.** Gehringer, P.; Eschweiler, H.; Fiedler, H. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Aug 1994. 7p. Order Number DE95627558. Source: OSTI; NTIS (US Sales Only); INIS.

Also to be published in the Proceedings of the 9th International Meeting on Radiation Processing, September 1994, Istanbul (TR).

Dose rate effect and low penetration are major disadvantages of electron beam irradiation. Addition of ozone before or during irradiation may eliminate the dose rate effect as shown for the remediation of a groundwater contaminated with trace amounts of chlorinated solvents such as trichloroethylene (TCE) and perchloroethylene (PCE). Beside the elimination of the dose rate effect the necessary radiation dose for pollutant decomposition is considerably lowered by the presence of ozone during irradiation. As a consequence the economy of the combined ozone/irradiation process becomes better than that of irradiation alone. Irradiation of turbulent water flows enables clean-up of water layers thicker than the maximum penetration of the electrons used. This effect is improved by the presence of ozone during irradiation, too. (authors).

16203 (OEFZS–4724) **Oxidative treatment of a waste water stream from a molasses processing using ozone and advanced oxidation technologies.** Gehringer, P. (Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria)); Szinovatz, W.; Eschweiler, H.; Haberl, R. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Aug 1994. 11p. Order Number DE95627559. Source: OSTI; NTIS (US Sales Only); INIS.

Also to be published in the Proceedings of the 12th Ozone World Congress and Exhibition, 15-19 May 1995, Lille (FR).

The discoloration of a biologically pretreated waste water stream from a molasses processing by ozonation and two advanced oxidation processes (O_3/H_2O_2 and O_3/γ-irradiation, respectively) was studied. Colour removal occurred with all three processes with almost the same efficiency. The main difference of the methods applied was reflected by the BOD increase during the discoloration period. By ozonation it was much higher than by AOPs but it also appeared with AOPs. AOPs were, therefore, not apt for an effective BOD control during discoloration. (authors).

16204 (PA-TR–3114) **Effects of gamma-ray irradiation on M1 propellant.** Abel, J.E. (Picatinny Arsenal, Dover, NJ (United States)); Mapes, J.E.; Levy, P.W. Picatinny Arsenal, Dover, NJ (United States). Feltman Research Labs. Apr 1964. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95009506. Source: OSTI; NTIS; GPO Dep.

Samples of M1 single-base propellant were exposed to 10^5, 10^6, and 10^7r of Co^{60} gamma rays. Burning rates were determined over a pressure range of 600 to 2600 psi at -40°, 21°, and 71°C. A statistical study indicated no significant change in the burning rate and a small but statistically significant increase (6%) in the exponential factor n after the 10^7r dose. Visible deterioration resulted, as the color changed from yellow to dark brown and the surface became uneven. In view of these marked visible effects, the slight change in burning rate is surprising. One sample exposed to 5×10^8r showed severe blistering, swelling, and contraction, and embrittlement causing fracture. Nitrogen Taliani tests conducted at 110°C indicated that the decomposition rate is decreased by exposure to 10^5r, is decreased less by 10^6r, and remains unchanged after 10^7r exposure. Chemical analysis showed that the percentage of 2-nitrodiphenylamine increases with dose by a factor of 7 at 10^7r, while, at the same time, the nitrogen content of the nitrocellulose decreases with increasing dose. This indicates that a substantial part of the nitrocellulose decomposition product had reacted with the diphenylamine stabilizer. It is remarkable that propellant strands obviously modified by exposure to 10^7r showed little or no change in burning rate.

16205 (RISO-R–804(EN)) **Atmospheric chemistry of hydrofluorocarbons and hydrochlorofluorocarbons.** Sehested, J. Risoe National Lab., Roskilde (Denmark). Environmental Science and Technology Dept. Mar 1995. 207p. Order Number DE95628583. Source: OSTI; NTIS; INIS.

Pulse radiolysis coupled with a time resolved UV absorption detection system and a FTIR spectrometer coupled to a 140 l reaction chamber was used to study the degradation of HCFCs and HFCs in the atmosphere. Reaction rates for a series of reactions of HFCs and HCFCs were investigated: F + RH, R + O_2 + RO_2 + NO, and RO_2 + NO_2 + M, together with UV absorption spectra of the halogenated alkyl (R) and halogenated alkyl peroxy radicals (RO_2). The products following the self reactions for RO_2 radicals for RO_2 = $CF_3CF_2O_2$, $CF_2HCF_2O_2$, $CF_3CH_2O_2$, CFH_2CFHO_2, CF_3O_2, and $CF_3C(O)O_2$ were investigated by the FTIR setup. The results show that the self reaction of halogenated peroxy radicals give the alkoxy radical, RO, as product. The atmospheric fate of these radicals were C-C bond cleavage for CF_3CF_2O, CHF_2CF_2O,

CFH_2CHFO, and $CF_3C(O)O$; while CF_3CH_2O radicals rect with O_2 to give CF_3CHO and HO_2. the reaction between CFH_2O_2 and HO_2 was shown to give 29±7 % CH_2FCOOH and 72±11 % HCOF as the carbon containing products. (Abstract Truncated)

16206 (SKB-TR–94-15) **Modelling of nitric acid production in the Advanced Cold Process Canister due to irradiation of moist air.** Henshaw, J. (AEA Technology, Decommissioning and Waste Management/Reactor Service, Harwell (United Kingdom)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1994. 30p. Order Number DE95626352. Source: OSTI; NTIS; INIS.

This report summarises the work performed for SKB of Sweden on the modelling of nitric acid production in the gaseous environment of the Advanced Cold Process Canister (ACPC). The model solves the simultaneous chemical rate equations describing the radiation chemistry of $He/Ar/N_2/O_2/H_2O$ gas mixture, involving over 200 chemical reactions. The amount of nitric acid produced as a function of time for typical ACPC conditions has been calculated using the model and the results reported. 11 refs, 11 figs, 1 tab.

The shortage of oxygen-18 enriched water has encouraged the authors to explore alternate methods of production of fluorine-18 where the recovery of the oxygen-18 enriched target material is extremely efficient. The authors have recently presented the results from a cryogenic target using carbon dioxide ice as the target. This is similar in design to a water ice target previously described. The amount of material required and the maximum beam current which can be put on the target are a function of the particular design. The effects of target cone length and number of cooling fins have been explored in order to optimize the target design. Three different targets have been used to test these parameters. The three targets are shown. The first was the prototype target with a single heat sink at the rear of the target. The second is a target with several cooling fins and a short cone length which requires less target material. The third is a target with several cooling fins but a longer target length which allows for more efficient cooling of the material. The results from these studies are summarized. The target with four cooling fins could be run at a beam current of 18 μA with no perceptible volatilization of the target material while the target with the single cooling block showed volatilization at about 8 μA. The long and short cone targets did not show a difference in the volatilization of the target material at the beam current limit of the 60 inches cyclotron (18 μA).

16209 (BNL–61149, pp. 77-81) **Production of ^{18}F from sodium-metal-target.** Schwarzbachs, R. (Paul Scherrer Institute, Villigen PSI (Switzerland)); Blaeuenstein, P.; Huszar, I.; Jegge, J.; Schubiger, P.A. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Fluorine-18 is produced in large scale for application in PET, mostly by the $O(p,n)^{18}F$ reaction. Looking for an alternative to this method, a reaction presented by Lagunas-Solar, which also yields ^{18}F has been examined: $^{23}Na(p,x)^{18}F$. The authors expected a much higher yield by producing ^{18}F from Na instead of ^{18}O-water due to the higher beam current. They wanted to know to which extent the more complicated process of separating ^{18}F from Na would reduce the yield due to the decay of ^{18}F. The presence of the accelerator with Ep = 72 MeV together with previous experience with a Rb metal target for ^{82}Sr production, brought about a fast development and testing of the Na target.

16210 (BNL–61149, pp. 105-118) **An investigation of aluminum alloy 6061 heat treatment and its effect on iodine absorption in Nordion gas targets.** Williams, D.R. (Nordion International, Inc., British Columbia (Canada)); Heilemann, S.; Webster, B.; Orzechowski, J. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The yield of I-123 from gas targets used by Nordion has been noted to vary from target to target given identical irradiation conditions and target geometries. It is suggested that changes in the microstructure occurring during welding of the aluminum 6061-T6 alloy used to make the target, may have an effect on the yield. Various samples of aluminum 6061 were heat treated to the TO, T4 and T6 conditions. The surface microstructure of representative samples were compared, including the machined surface finish as well as the grain structure of the sample. These samples were immersed in a sodium iodide solution labelled with I-123 under similar conditions as that found in the gas target during a production run. The samples were then rinsed and counted for activity remaining on their surface.

16211 (BNL–61149, pp. 126-129) **Production of long-lived radioisotopes and its application to calibration sources for PET cameras.** Gonzalez-Lepera, C. (Univ. of Pennsylvania, Philadelphia, PA (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

An internal solid target station was developed for the JSW3015 Cyclotron. Manual loading and retrieval of irradiated targets is executed with minimal operator intervention, thus reducing exposure. Preliminary results concerning the production of small amounts of the radioisotope ^{22}Na (2.6 yr. half-life) via the reaction $^{24}Mg(d,\alpha)^{22}Na$ are presented. Chemical extraction of the product from the target matrix and construction of linear sources for PET cameras is also discussed.

16212 (BNL–61149, pp. 154-159) **Overview on ammonia production.** Berridge, M. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The author reviews work concerning the production of ^{13}N ammonia. The interest in this compound stems from its use as a radiopharmaceutical.

16213 (BNL–61149, pp. 160-167) **A novel solid graphite target for the production of ^{13}N-ammonia.** Hughey, B.J. (Science Research Lab., Inc., Somerville, MA (United States)); Shefer, R.E.; Klinkowstein, R.E.; Dence, C.S.; Welch, M.J. Brookhaven National Lab., Upton, NY (United States). 1994. Grant 1R43HL48969; Grant 2R44CA53953; Contract SDI084-89-C-0049. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

This paper describes a technique for rapid and efficient in-situ extraction of ^{13}N activity from solid graphite after deuteron beam bombardment. This technique is particularly applicable to the production of ^{13}N at low bombarding energy (less than 5 MeV), and was developed for use with the 3.7 MeV Tandem Cascade Accelerator (TCA) developed at Science Research Laboratory (SRL). Use of this target at deuteron beam energies as low as 1.2 MeV has been investigated and has led to the design of an ultra-low energy ^{13}N-ammonia generator described in an accompanying paper. The various techniques used for the in-target production of ^{13}N with cyclotron beams cannot be used for isotope production at low bombarding energy because of the high thresholds of the commonly used ^{16}O(p,α)^{13}N and ^{13}C(p,n)^{13}N reactions. The ^{12}C(d,n)^{13}N nuclear reaction has a low threshold energy (0.33 MeV) and a high yield at low bombarding energy. A charcoal slurry target using this reaction has been investigated for use with a 3.5 MeV deuteron beam. However, the requirement for a foil target window with any liquid or gas phase target is incompatible with isotope production at 1.2 MeV beam energy because a large fraction of the beam energy will be deposited in the window itself. Carbon-12 in the form of solid graphite is an excellent accelerator target material. A solid graphite target can be placed directly in the accelerator vacuum beam line, thereby eliminating the need for a target window.

16214 (BNL–61149, pp. 168-170) **Production of N-13 ammonia using a solid graphite target and the ^{12}C (d,n) ^{13}N nuclear reaction.** Dence, C.S. (Washington Univ., St. Louis, MO (United States)); Welch, M.J.; Hughey, B.J.; Shefer, R.E.; Klinkowstein, R.E. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

With the appearance of new low energy accelerators dedicated to the production of short-lived isotopes, comes new approaches to the production of radiopharmaceuticals. The nuclear reaction ^{12}C(d,n)^{13}N was chosen for this study because of its low energy threshold (0.33 MeV) and therefore compatibility with these low energy accelerators. Low porosity graphite was chosen as the target material; irradiated graphite has been used since 1940 to extract N-13 for biological studies (4-8) but in most cases the activity was obtained as N-13 nitrogen. Kjeldahl digestion and microwave irradiation have also been applied to obtain N-13 ammonia. The authors studied the extraction of N-13 nitrogen from a solid graphite target after deuteron beam irradiation and heated in an atmosphere of pure oxygen, the authors identified the species formed and converted them to N-13 ammonia.

16215 (BNL–61149, pp. 171-177) **Experiences with a new high pressure water target for the production of [^{13}N] ammonia.** Gonzalez-Lepera, C. (Univ. of Pennsylvania, Philadelphia, PA (United States)); Dembowski, B.; Staub, J. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The authors present preliminary results on the operation of a newly designed high-pressure water-ethanol target for in-situ production of [^{13}N]ammonia. The results show some similar trends as those reported by Wieland et al. and Korsakov et al. when parameters like ethanol concentration, target pressure, beam current and irradiation dose are considered. More than 100 mCi of [^{13}N]Ammonia → 99% purity – ready for injection are routinely produced in 10 min. runs.

16216 (BNL–61149, pp. 180-182) **In-target preparation of [^{13}N]ammonia: Target design and chemistry.** Berridge, M.S.; Landmeier, B.J. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Over the past several years, efforts to implement the reported methods for direct in-target production of [^{13}N]ammonia have brought interesting results. Before the most recent series of reports on dilute ethanol solutions for ammonia production, the available information concerning organic additives was not detailed; and the authors were intrigued, primarily by the regulatory advantages, by the possibilities of direct ammonia production under hydrogen pressure without the use of organic additives. Therefore the authors have explored the products given by use of hydrogen gas over a small-volume water target as a function of gas pressure and of beam dose and dose rate. The authors also investigated the effects of pressure alone by using helium or nitrogen gas to pressurize the target. The target was aluminum or copper-nickel, with a volume of 3 mL, pressurized with 1-8 atm. hydrogen and irradiated with a Scanditronix MC17 with 17 MeV protons. Beam currents to 30 μAmp for 30 min were used. The targets were designed with a gas head space over the target water to prevent water losses by bubble formation at high beam dose and to allow good contact between. the water and the hydrogen gas. The head space allowed substantially higher beam current and irradiation times to be used. Entrance foils (Havar) were chosen thick enough to drop the incident energy below the 150 production threshold, so 150 contamination was not observed.

16217 (BNL–61149, pp. 183-187) **[^{13}N]ammonia production via deuteron irradiation of buckminsterfullerene.** Bida, G. (Biomedical Research Foundation of Northwest Louisiana, Shreveport, LA (United States)); Satyamurthy, N.; Zippi, E. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The most common nuclear reactions used for the accelerator production of nitrogen-13 are graphically summarized. At present, [^{13}N]ammonia is generated in ample quantities for PET imaging purposes by the interaction of relatively energetic(6-17 MeV) protons with an oxygen-16 rich target(natural abundance water) or carbon-13 rich target. Natural abundance carbon must be used for the low energy deuteron production of ^{13}N and is the target of choice in preliminary results for ^{13}N production using 8 MeV $^{3}He^{2+}$. In some cases, the ^{13}N produced is already in the form of ammonia, while in others, the radiolabeled species must be chemically converted to ammonia. In order to meet the anticipated growth in clinical use of this important MBF tracer and to keep pace with the development of smaller, lower energy accelerators that can operate at $<$ 8 MeV incident particle energy, sufficient ^{13}N can only be readily produced with a carbon-rich target such as fullerenes.

16218 (BNL–61149, pp. 189-201) **An experimental carbon/steam stack target for in-situ production of [^{13}N]ammonia with low energy deuterons.** Morelle, J.L. (Ion Beam Applications, Louvain-la Neuve (Belgium)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Continuing investigations aimed at the production of clinically useful amounts of ^{13}N ammonia with low energy deuterons via the ^{12}C(d,n)^{13}N reaction, thin carbon foil/steam stacks were built and tested. Using 3.3 MeV deuterons, practical $^{13}NH_4^+$ saturation yields of around one mCi/μA were delivered by such systems. A few runs were also performed with a stack of woven carbon fiber

fabric and steam layers. Yields of around 2 mCi/μA were recovered in the aqueous phase.

16219 (BNL–61149, pp. 208-212) **Targetry for the ruthenium-97 and tungsten-178 (tantalum-178) production on the phasotron of JINR.** Zaitseva, N.G. (Joint Institute for Nuclear Research, Dubna (Russian Federation)); Stegailov, V.I.; Khalkin, V.A.; Shakun, N.G.; Shishjannikov, P.T. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

This paper describes recent developments of the solid target system for the production of ^{97}Ru and ^{178}W in the ^{99}Tc(p,3n)^{97}Ru and ^{181}Ta(p,4n)^{178}W reactions. Radioisotope production proceeds on the internal 50-70 MeV proton beam of JINR phasotron. The target construction, condition of the irradiation and radionuclide practical yields were searched.

16220 (BNL–61149, pp. 232-233) **Purification of ^{89}Zr using a hydroxamate column.** Meijs, W.E. (Free Univ., Amsterdam (Netherlands)); Herscheid, J.D.M.; Haisma, H.J.; Leuffen, P.J. van; Mooy, R.; Pinedo, H.M. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Positron emission tomography (PET) is the best way for non-invasive quantification of the biodistribution of radioisotope-antibody conjugates, required for dosimetric calculations for radioimmunotherapy. The positron emitter ^{89}Zr has good physical characteristics for this application. It has a relatively long half-life (t1/2 = 78.4 h) and decays for 23% by positron emission and for 77% by electron capture to ^{89}Y (stable). The total particle release per desintegration of approximately 100 keV even opens the possibility for therapeutic applications.

16221 (BNL–61149, pp. 234-242) **Nuclear data relevant to the production of ^{67}Ga: A critical comparison of excitation functions/thick target yield data for ^{67}Zn(p,n) and ^{68}Zn(p,2n) nuclear reactions.** Szelecsenyi, F. (Mount Sinai Medical Center, Miami Beach, FL (United States)); Boothe, T.E.; Tavano, E.; Plitnikas, M.; Takacs, S.; Tarkanyi, F. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The method of choice for routine production of ^{67}Ga on a low energy cyclotron is the ^{67}Zn(p,n)^{67}Ga reaction while above 20 MeV the ^{68}Zn(p,2n)^{67}Ga process results in a higher yield of gallium. To optimize the yields in a production setting it is important to know the cross sections/thick target yield data of these reactions. In spite of the large amount of experimental information on cross section/thick target yield data of the desired reactions published up to 1993, the status in some cases is not satisfactory. In the present work, the authors have compared the available cross sections/thick target yield data and have tried to resolve the most obvious discrepancies which have appeared in the literature. The authors also present an evaluated data base for the mentioned data for the ^{67}Zn(p,n)^{67}Ga and ^{68}Zn(p,2n)^{67}Ga nuclear reactions.

16222 (BNL–61149, pp. 249-260) **Detectors and transducers for target operation and automated P.E.T. chemistry.** Zeisler, S.K. (TRIUMF, British Columbia (Canada)); Ruth, T.J.; Rektor, M.P.; Gschwandtner, G.A. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Remote target operation as well as automated PET chemistry syntheses generally require feedback from the target or synthesis module to the computer control unit. Transducers such as pressure sensors and conductivity probes can be used to indicate the filling status of gas or liquid targets. Many radiopharmaceutical preparations involve the transfer of liquids containing radioactivity and the evaporation of solvents. The authors' goal was the automation of a production system for [^{18}F]-FDG consisting of a low-volume high pressure target and a synthesis module based on the TBA-HCO_3 method by means of three recently developed devices: a non-invasive bolus detector to ensure complete filling of the water target, a small pfotodiode radiation detector to monitor trapping of the ^{18}F-fluoride, on the ion exchange resin and its elution from the column, a thermistor probe to determine the endpoint of solvent evaporations from the reaction vessel. The detectors deliver a signal suitable for processing in the Optomux™ control system. They show excellent reliability and have been successfully tested in [^{18}F]-FDG, [^{18}F]-FDOPA, and [^{13}N]-NH_3 production.

16223 (BNL–61149, pp. 261-265) **A simple liquid detector for radiopharmaceutical processing systems.** Alexoff, D.L. (Brookhaven National Lab., Upton, NY (United States)); Hallaba, K.; Schlyer, D.; Ferrieri, R. Brookhaven National Lab., Upton, NY (United States). 1994. DOE Contract AC02-76CH00016. Grant NS-15380. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Sensing the presence of liquids in tubing and vessels in radiochemical processing equipment provides information important to the remote or automatic control of the production of clinical doses of radiopharmaceuticals. Although modern commercial automated radiopharmaceutical synthesis machines do not usually include liquid presence as a measured process variable, earlier more complex automated synthesis devices did; and the inclusion of such feedback can increase system reliability and simplify troubleshooting tasks carried out by computer software or human operators. Commercial liquid level detectors are often designed for large-scale industrial processes and are therefore too large or expensive to be useful in many radiochemical hardware systems. An inexpensive miniature optical liquid detector originally by Kramer and Fuchs has been duplicated here for use in monitoring the presence of liquids in teflon tubing (1/16 in. O.D.) in an enriched oxygen-18 water recovery system.

16224 (BNL–61149, pp. 271-273) **Solvent vapor sensor & bolus detector for radiosynthesis.** Ducret, A. (CERMEP, Lyon (France)); Veyre, L.; Landais, P.; Le Bars, D. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

One of the key points in the Hamacher method of [^{18}F]FDG synthesis, in common with many other chemical reactions, is the need for an anhydrous state of the ^{18}F/Kryptofix complex before addition of the mannose triflate. This is usually done by ensuring enough time elapses after the additions of acetonitrile for azeotropic distillation of the carbonate/K 2.2.2 solution, with the resulting possibility of overheating the dry kryptofix adduct. In this system, the entire [^{18}F]FDG synthesis is controlled by a Siemens Simatic S100 PLC; the fluorination takes place in an open Sigradur® vessel. The authors choose to automate this evaporation step with the control of this little vapor sensor, used otherwise to detect explosive atmospheres. The sensor is based on a miniature flammable gas sensor designed for detection of propane, butane, natural and "town" gas, using the platinum wire (pellistor) principle. Acetonitrile and organic flammable solvents are easily detected, the difference ($\sim$ 30 mV) between the platinum sensing filament and compensating filament is measured and drives a K relay interfacing the Simatic PLC. Response time is within 3 seconds after complete disappearance of the solvent.

16225 (BNL–61149, pp. 274-275) **Sensors for indication of evaporation of solvents: Experience at the Univ. of Washington.** Link, J. (Univ. of Washington, Seattle, WA (United States)); Krohn, K.; Courter, J. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop

on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The authors have been developing sensors for indicating dryness and solvent removal in robotic syntheses. Initially, the robotic arm would hold up the reaction vessel and the operator would observe the sample through lead windows, but it was soon realized that looking dry, wasn't dry. Hence, the authors are investigating other types of sensors for indicating solvent removal. One sensor examined involves conductivity. One sensor design was comprised of two steel or Pt wires sheathed in fused silica capillaries to electrically isolate them from each other, with less than 0.05 cm of wire exposed to the reaction mix in the reaction vessel. The authors measured the change in resistance during drying. It was hypothesized that resistance would increase as the reaction became dry and become infinite when all solvent was removed. A water/CH_3CN mixture at 96°C was dried with argon blowing over it. The conductivity changed with drying as shown, but not the way expected. The technique was not very sensitive. The measured resistance went to 0 and then negative as the solvent disappeared. Also there is the disadvantage of having a probe in contact with the sample, which caused loss of sample due to dried solids staying on the surface of the probe and the potential for contaminating the reaction. A thermocouple sensor is currently being evaluated in the synthesis of thymidine.

16226 (BNL–61149, pp. 276-283) **An efficient system for the preparation of [^{11}C]-HCN, CO_2 and CO.** Dahl, J.R. (Cornell Univ. Medical College, Manhasset, NY (United States)); Matacchieri, R.A.; Belakhlef, A.; Chaly, T.C.; Margouleff, D. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A number of systems for the routine preparation of the [^{11}C]-labeling precursor compounds have been reported and a number of systems are commercially available which satisfy these requirements with varying degrees of success. Local conditions and techniques often impose new requirements not discernible during the design of a commercial system. Such was the case with the ^{11}C system at North Shore University Hospital. As supplied, this system was operated remotely by selecting a flow path by means of toggle switches on a control panel. A dummy diagram assisted in selection of the path and appropriate operation of the toggle switches. Skilled, experienced chemists left undisturbed and allowed to concentrate on the task could, with practice, operate the system effectively. However, inappropriate switching of the flow path could easily cause reagents to be sucked into the system, usually with the result that a run was lost and the system rendered inoperative until repaired. To improve reliability and increase ease of operation, the system was redesigned, taking advantage of the opportunity to increase system automation as much as possible. Since the automatically controlled functions on the MC17F cyclotron and associated systems are controlled through programmable logic controllers (PLC's) it was decided to continue with this method rather than instituting a dedicated micro-computer with interface boards.

16227 (BNL–61149, pp. 294-297) **Synthetic application of column extraction to automated preparations of PET radiopharmaceuticals.** Iwata, Ren (CYRIC Tohoku Univ., Sendai (Japan)); Ido, Tatsuo. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Organic synthesis generally requires extraction for purification of a reaction product. In PET radiochemistry this liquid-liquid extraction has often been conveniently substituted for solid phase extraction with a commercially available short C18 column to accommodate a procedure to remote control or automation. However, this replacement cannot be applied to all PET radiopharmaceutical preparations, and consequently conventional liquid-liquid extraction is sometimes inevitably employed using a specially designed device to automate this procedure.

16228 (BNL–61149, pp. 308-311) **Presentation of the FDG microlab.** Koziorowski, J. (GEMS PET Systems AB, Uppsala (Sweden)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The initial report on the MicroLab was presented at the IVth target workshop at PSI, Switzerland in 1991. It was a technical description and a presentation of the specifications, yet no experimental data were presented. This presentation is based on data and experience from the clinical sites and is therefore an experimental data presentation and not a product specification. The synthesis is, based on the solid-phase Mulholland method. The yield and radiochemical purity depends on the quality (purity) of the target water. The nature of the target water impurities is, at the time being, not known.

16229 (BNL–61149, pp. 312-318) **Advances in the robotic production of radiopharmaceuticals.** Gaehle, G. (Washington Univ. School of Medicine, St. Louis, MO (United States)); Welch, M.J. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A variety of robotic systems, including Zymark, Hudson Control Group, Anotech, and Questech formerly U.M.I, have been used as a reliable and safe way to produce radiopharmaceuticals. A robotic system's ability allows it to produce a variety of radiopharmaceuticals on a routine basis including final preparation and quality control. With proper scheduling, a single robotic system can synthesize ^{18}F-fluorodeoxyglucose, ^{18}F-estradiol, ^{11}C-acetate, ^{68}Ga-citrate and at the same time control black box type syntheses such as ^{15}O-butanol in a single day. A robotic system's flexibility allows it to be used in designing and testing new syntheses, thus making the development of the new radiopharmaceuticals safer for the chemist. The development of Windows, a multi-tasking operating system for PC computers, allows a robot controlled by that computer to function simultaneously with a large variety of other systems. This increases the system's ability to communicate with other systems and it allows for change without replacing the entire system. Improvements in robot technology has increased their reliability while making them competitive in price to other means of automation. Today a robotic system to produce ^{18}F-fluorodeoxyglucose can cost as little as $55,000 U.S. depending on the cost of the hot cell.

16230 (BNL–61149, pp. 335) **Experience with the IBA automated chemistry systems.** Toorongian, S. (State Univ. of New York, Buffalo, NY (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A presentation by the author concerning the IBA chemistry systems precipitated this question and answer session. Comments centered on the production of fluorine 18 and labelled FDG.

The PET program at Washington University has evolved over more than three decades of research and development in the use of positron-emitting isotopes in medicine and biology. In 1962 the installation of the first hospital cyclotron in the USA was accomplished. This first machine was an Allis Chalmers (AC) cyclotron and it was operated until July, 1990. Simultaneously with this cyclotron the authors also ran a Cyclotron Corporation (TCC) CS-15 cyclotron that was purchased in 1977. Both of these cyclotrons were maintained in-house and operated with a relatively small downtime (approximately 3.5%). After the dismantling of the AC machine in 1990, a Japanese Steel Works 16/8 (JSW-16/8) cyclotron was installed in the vault. Whereas the AC cyclotron could only accelerate deuterons (6.2 MeV), the JSW - 16/8 machine can accelerate both protons and deuterons, so all of the radiopharmaceuticals can be produced on either of the two presently owned accelerators. At the end of May 1993, the medical school installed the first clinical Tandem Cascade Accelerator (TCA) a collaboration with Science Research Laboratories (SRL) of Somerville, MA. Preliminary target testing, design and development are presently under way. In 1973, the University installed the first operational PETT device in the country, and at present there is a large basic science and clinical research program involving more than a hundred staff in nuclear medicine, radiation sciences, neurology, neurosurgery, psychiatry, cardiology, pulmonary medicine, oncology, and surgery.

16232 (BNL–61149, pp. 344-346) **Radioisotope production at JYFL Accelerator Laboratory in Finland.** Kumpulainen, J. (MAP Medical Technologies, Inc., Tikkakoski (Finland)); Hiltunen, J.; Aeystoe, J.; Julin, R.; Liukkonen, E.; Nieminen, V.; Poikolainen, T. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

MAP Medical Technologies Inc. is a private, research oriented high-tech company, which produces radiopharmaceuticals for both diagnostic and therapeutical purposes. MAP has one nuclear reactor and one high-energy cyclotron at its disposal for research and production. The new production plant was completed in 1992, which was specially designed to fulfil the highest new requirements and standards for production and products. High-energy machines, like the new K130-cyclotron in the University of Jyvaeskylae, have a great potential for producing some special radioisotopes. Thus a solid target station for radioisotope production was planned into the new accelerator laboratory in collaboration between the Department of Physics (JYFL) and MAP. The target station is designed for high-energy intensive light-ion beams delivered from the K130-cyclotron.

16233 (BNL–61149, pp. 347-352) **A new radioisotope - production research facility utilizing ion beams from AVF cyclotron.** Sekine, T. (Japan Atomic Energy Research Institute, Takasaki (Japan)); Matsuoka, H.; Shigeta, N.; Koizumi, M.; Osa, A.; Izumo, M.; Kobayashi, K.; Hashimoto, K.; Hatsukawa, Y. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

At the Takasaki-site of JAERI, an AVF cyclotron has been constructed for advanced radiation technology research. From the cyclotron equipped with a multicusp ion source and ECR ion sources, beams of light ions and heavy ions are available for production of a broad range of radioisotopes. A radioisotope production facility utilizing these ion beams has been constructed for research and development of potentially useful radioisotopes. At the Tokai site, JAERI has nuclear reactors and a tandem accelerator. Using the reactors, JAERI has established production techniques of various radioisotopes and supplied products across Japan for medical, industrial and scientific use. As to isotopes to be produced by charged-particle reactions, production methods have been developed for isotopes such as ^{95m}Tc and ^{237}Pu which are used as tracer in research of the technetium and plutonium behavior in the nuclear fuel cycle and the environment. At the Takasaki site, production methods will be developed for potentially useful radioisotopes mainly in medicine and life science. For this purpose, solid, gas and liquids targets must be irradiated and chemically processed to produce the isotopes of light and heavy elements and their labelled compounds. The Takasaki facility consists of an irradiation apparatus, a solid-target transfer system, shielded cells for solid target and shielded cells for labelled-compound synthesis with gas and liquid targets.

16234 (BNL–61149, pp. 359) **Utilization of the CS-30 cyclotron at the Duke University Medical Center.** Wieland, B.W. (Duke Univ., Durham, NC (United States)); McKinney, C.J.; Dailey, M.F. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). Present routine radionuclide production includes ^{18}F fluoride from protons on ^{18}O water, ^{13}N ammonia from protons on ^{13}C slurry, ^{15}O water from deuterons on nitrogen gas, and ^{211}At from alphas on bismuth metal. Clinical PET using two tomographs (GE 4096 and Advance) is done Tuesday through Friday, typically 4 to 11 patients per day using ^{15}O water, ^{13}N ammonia, and ^{18}F FDG synthesized with a GE Microlab. Clinical patient studies are 50% neurology using FDG, 45% body using FDG, and 5% cardiology using ammonia and FDG (oncology in these three areas totals 60%). ^{15}O water for clinical research patients (THC and cognitive) is produced twice a week. ^{211}At is produced about twice a week for monoclonal antibody labelling.

16235 (BNL–61149, pp. 360-363) **Production of ^{55}Co for positron emission tomography.** Dahl, J.R. (Cornell Univ. Medical College, Manhasset, NY (United States)); Pan, J.; Matacchieri, R.A.; Belkhlef, A.; Margouleff, D. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Cobalt-55 is a radioisotope of cobalt which decays with a 17.5 hour half life, 77% by positron emission and the remainder by electron capture. A number of other gamma photons are emitted during each decay event. It may fill the need for a positron emitting tracer for labeling compounds of medical and biological interest with a radionuclide with a half-life longer than that offered by the commonly used positron emitting radionuclides, ^{11}C, ^{13}N, ^{15}O, and ^{18}F. It provides the opportunity to use very high specific activity radioactive divalent cations to visualize nerve cell degeneration in the brain without sacrifice of the subject. A second factor which generates interest in ^{55}Co is that Co^{++} ion mimics Ca^{++} ion in certain neuronal tissue, providing the opportunity to investigate Ca^{++} kinetics in degenerating brain tissue without sacrifice of experimental animals. A third source of interest is the one that stimulated modern interest in ^{55}Co: when substituted for ^{57}Co as the label in radio labeled bleomycin, this important and widely used tumor scanning agent becomes even more important for similar studies using PET. Published calculations comparing the internal radiation dose from 1 micro-curie of ^{55}Co and of ^{57}Co indicate the dose is strongly dependent upon the biological half-life, and the dose from ^{55}Co will be comparable to that of ^{57}Co. The objectives of this project are the development of a method for the routine preparation of ^{55}Co via the ^{54}Fe(d,n)^{55}Co nuclear reaction, using a small medical cyclotron, and to investigate its utility as a radiotracer for positron emission tomography (PET).

16236 (BNL–61149, pp. 365-370) **Present status and prospects of production of radioisotopes with high radiochemical purity on the FLNR accelerators.** Dmitriev, S.N. (Joint Institute for Nuclear Research, Moscow (Russian Federation)); Gulbekyan, G.G.; Oganessian, Yu.Ts. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY

(United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The purpose of the FLNR work on radioisotopes is: (1) support of nuclear physical and radiochemical research, such as synthesis of transfermium elements and study of their chemical properties; (2) production of radioisotopes for special medical, biomedical and ecological research. The Laboratory has three operating accelerators: two heavy ion cyclotrons U-400 and U-200 and one compact electron accelerator - microtron MT-25. For the production of radioisotopes in the reactions, n and n, the authors use a compact electron accelerator MT-25. The main parameters of this machine are presented.

16237 (BNL–61149, pp. 371-376) **Establishment of an European Astatine Collaboration.** Weinreich, R. (Universitaet Zuerich (Switzerland)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

^{211}At is an extremely radiotoxic nuclide. It decays with a half-life of 7.2 hrs by emission of (on average) one α-particle and a number of Auger and Coster-Kronig electrons per decay. The maximum range of the a-particles is 80 μm, consequently a few cell diameters. In the last years, the general interest in astatine labelled compounds for radionuclide therapy has been reinforced: studies of the radiobiological behaviour of ^{211}At in cell culture-experiments confirmed clearly its usefulness for radiotherapeutic applications. Astatine compounds have been found which are relatively stable and useful as linkers between the nuclide and carrier proteins. A clinical study using ^{211}At-Methylene blue as radiotoxic substance as well as tumour-seeking ligand is now under consideration. On the other hand, the low availability of the nuclide is still the most important limitation for a broader clinical application: for production of this nuclide, α-particles of 28 MeV are needed. These particles are mostly generated in medium-energy multi-particle accelerators of variable energy. Such accelerators, however, are generally used by different research groups with different research aims and consequently different beamtime modes.

16238 (IAERU–9304, pp. 1-8) **From trace chemistry to single atom chemistry.** Adloff, J.P. (Strasbourg-1 Univ., 67 (France)). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms*. 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

Hot atom chemistry in the vast majority of experimental works deals with the trace amount of radioactive matters. Accordingly, the concept of trace chemistry is at the heart of hot atom chemistry. Some aspects of the chemistry at trace scale and at subtrace scale are presented together with the related problems of speciation and the complication which may arise due to the formation of radio colloids. The examples of ^{127}I(n,γ)^{128}I and ^{132}Te (β^-)^{132}I are shown, and the method based on radioactivity was used. The procedure of separating the elements in pitchblende is shown as the example of the chemistry of traces. $_{13}{}^{27}Al+_{2}{}^{4}He\rightarrow_{0}{}^{1}n+_{15}{}^{30}P$ and $_{15}{}^{30}P\rightarrow_{14}{}^{30}Si+e^{+}+V$ are shown, and how to recognize the presence of radioactive colloids is explained. The formation of radiocolloids is by the sorption of a trace radioelement on preexisting colloidal impurity or the self-condensation of monomeric species. The temporal parameters of the nature of reactions at trace concentration are listed. The examples of Class A and Class B reactions are shown. The kinetics of reactions at trace level, radon concentration, anthropogenic Pu and natural Pu in environment, the behavior of Pu atoms and so on are described. (K.I.).

16239 (IAERU–9304, pp. 32-42) **Primary processes and ionic reactions in the chemistry of recoiling silicon atoms.** Gaspar, P.P. (Washington Univ., St. Louis, MO (United States). Dept. of Chemistry); Garmestani, K.; Boo, B.H.; Stewart, G.W. Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms*. 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

Hot atom chemistry has permitted the elucidation of the chemistry of free atoms, and these include the polyvalent atoms of refractory group 14 elements, that is, carbon, silicon and germanium. Since no more than two bonds are formed normally in a single reactive collision of free atoms, the study on the chemistry of atoms like C, Si and Ge that require the formation of more than two bonds to saturate their chemical valence necessarily involves the study of reactive intermediates. By the studies on the chemistry of recoiling ^{31}Si atoms, the mechanistic conclusions reached are reported. The most important unanswered questions concerning the reaction of recoiling ^{31}Si atoms in the systems are shown, and progress has been made toward the answering. By using tetramethyl silane as a trapping agent for silicon ions, it has been established that the reaction of ^{31}Si ions contributes significantly to the formation of products in recoil systems. The studies by various researchers on this theme are reported. (K.I.).

16240 (IAERU–9304, pp. 45-50) **Hot atom chemistry of astatine and some remarks on cage reactions.** Berei, K. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Vasaros, L. Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms*. 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

Systematic studies have been carried out on the hot replacement reaction of astatine originating from nuclear transformation. A mixture of neutron-deficient noble gas isotopes was able to be obtained as the spallation products by bombarding metallic thorium or uranium with 660 MeV protons in a synchrocyclotron. The isolation of radon isotopes from this mixture is easily performed by gas chromatography using molecular sieves. The longest lived radon isotope, ^{211}Rn (14.6h), purified and filled into ampoules containing organic compounds decomposes partly by EC and serves as a source of recoil ^{211}At reacting in situ. The reaction of recoil ^{211}At with benzene and its monosubstituted derivatives in gaseous, liquid and solid phase leads to replacement products with considerable yields. An example of isomer distribution if recoil ^{211}At replaces hydrogen atoms in aniline, chlorobenzene or nitrobenzen is shown. The halogen replacement by recoil astatine in monohalobenzene, the experiment with binary mixtures of chlorobenzene and its substituted derivatives, and three types of radical interactions concerning cage reactions are described. (K.I.).

16241 (IAERU–9304, pp. 55-62) **Stereo organic halogen hot atom chemistry. Present solutions, future projects.** Rack, E.P. (Nebraska Univ., Lincoln, NE (United States). Dept. of Chemistry); Kingsbury, C.; Ferrieri, R.A.; Wolf, A.P. Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms*. 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

Regarding the two-decade joint venture between the University of Nebraska and Brookhaven National Laboratory, an overview of the major accomplishments, their relevance to physical organic chemistry and future projects is presented. Stereoorganic halogen hot atom chemistry can provide insight into the mechanistic aspects or dynamics of gas phase hot atom reaction. The hot atoms studied were recoil ^{18}F, ^{34m}Cl and ^{75}Br generated by cyclotron irradiation and ^{38}Cl by nuclear reactor irradiation. The target molecules were enantiomeric 2-halopropionyl halides and diastereomeric dihalobutanes. For both targets, the effects of rare gas moderators on both percents of retention and inversion of configuration and their absolute yields were studied. This work leads to the postulate that substitution can occur by one of two direct replacement mechanisms. The net inversion of configuration was observed by using ^{75}Br and ^{34m}Cl as the displacing agent, and the predominant retention of configuration was found when ^{18}F was

used. In order to assist the determination of the conformational effects of hot atom reaction, molecular mechanics calculation was performed. The papers published by this project are listed. (K.I.).

16242 (IAERU–9304, pp. 63-78) **Annealing studies and exchange reactions.** Collins, C.H. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Quimica). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms.* 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

The relative values of nuclear recoil energy and bond energy are such that it is reasonable to expect the rupture of practically all the chemical bonds of the molecules in which the nuclear transformation occurs. The case of crystalline solids is mentioned, and annealing reaction is explained. Annealing reaction is induced by various causes, and the extent of annealing is related to the nature of crystal lattice. Low temperature thermal annealing processes often occur at distinct temperature intervals, suggesting a series of reactions of different, possibly discrete activation energies. At higher temperature, the annealing processes involving recoil atoms closely resemble the reactions which occur in the solids being doped. Since doping procedure introduces the radioactive species into very different chemical environment, the annealing reaction is considered to be insensitive to the exact nature of the annealing site, and reflects such bulk properties of the crystal as crystalline defects and dislocations. The variety of substrates which show the annealing reactions of recoil atoms or of dopant atoms suggest that no single model or mechanism suffices. There are many possibilities for describing such reactions. (K.I.).

16243 (IAERU–9304, pp. 79-96) **Hot atom chemistry of mixed crystals. 35 years of research.** Mueller, H. (Freiburg Univ. (Germany)). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms.* 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

When this contribution was prepared, the author decided to present the more personal aspects of his work and the concepts that directed him. Since the time when the author interested in solid state hot atom chemistry more than 30 years ago, still now the generally accepted theory has not been existed. The irradiation test by using the BEPO pile in Harwell is reported. The use of glass fiber paper instead of cellulose paper was investigated. The real problem of the different models of primary retention should be solved. The idea of mixed crystal systems was the result of an experimental accident. The attempt of preparing mixed crystals, the papers that the author has written, the procedures of the experiment such as electrophoresis, the results of the electrophoretic separation are discussed. The next step was obviously the investigation of the ligand recoil. The production of the transient ligand vacancy complexes and their final fate resulted in mixed hexachlorobromometallate species is shown for the system $K_2O_sCl_6$-$K_2O_sBr_6(n,\gamma)^{38}Cl$. The reaction of the ^{38}Cl, the information about recoil atom reactions which increased with the complexity of target substances, and the resulted informations are reported. (K.I.)71 refs.

16244 (IAERU–9304, pp. 99-112) **Molecular beam studies and hot atom chemistry.** Continetti, R.E. (California Univ., San Diego, La Jolla, CA (United States). Dept. of Chemistry); Lee, Y.T. Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms.* 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

The application of the crossed molecular beam technique to the study of hot atom chemistry has provided significant insights into the dynamics of hot atom reaction. To illustrate this, two recent studies are discussed. Those are the study on the influence of translational energy in 0.6 to 1.5 eV range on endoergic reaction, and the experimental study on the detailed dynamics of elementary reaction at translational energy of 0.53 and 1.01 eV. The first example illustrates the contribution that molecular beam experiment can make in the understanding of the dynamics of endoergic substitution reaction. The second example illustrates the role that such studies can play in evaluating exact three-dimensional quantum scattering calculation and ab initio potential energy surfaces for chemical reaction. In the case of endoergic reaction of halogen substitution, it was observed that the reactive collision involved short lived collision complexes. It is suggested that energetic effect alone cannot account for the difference in cross sections, and dynamic effect most play a large role. In atom-diatom reaction, the differential cross section measurement of $D+H_2 \rightarrow DH+H$ reaction was carried out, and the results are discussed. (K.I.).

16245 (IAERU–9304, pp. 155-166) **Remarks on theoretical hot-atom chemistry.** Inokuti, Mitio (Argonne National Lab., IL (United States)). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms.* 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

The publication of the 'Handbook of Hot Atom Chemistry', following the earlier volume 'Recent Trend and Application', was a major milestone in physical chemistry. Theoretical treatments of hot atom chemistry must address two classes of problems. The first class concerns the individual collisions of hot atoms with other atoms or molecules. The second class concerns the description of the consequences of the many collisions of hot atoms and their chemical environment. Most of the remarks pertain to the problems of the first class. The central issue is the adiabaticity of nuclear motions versus electronic motions. To be precise, any atomic core motion should be mentioned rather than pure nuclear motion, because tightly bound core electrons are largely irrelevant to the chemistry. When nuclear motions are sufficiently slow, or for other reasons that can be regarded as adiabatic, the collision problem is basically straightforward, therefore, interatomic and intermolecular forces can be assumed, and their consequences for nuclear motions are calculable in principle. In the case of non-adiabaticity being important, much more difficult problems arise, and it is briefly discussed, and the work by Phelps is cited. (K.I.).

16246 (IAERU–9304, pp. 187-195) **Hot atom chemistry and radwaste disposal.** Adloff, J.A. (Strasbourg-1 Univ., 67 (France)). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms.* 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

The recoil effects accompanying the α decay of radionuclides led to the discovery of several radioisotopes, and have been utilized for the separation of radioelements in carrier-free state. On a much larger scale, α-recoil effects are operative in nature, and they are the origin of the disruption of the radioactive equilibrium between the members of natural radioactive series. In α decay, the recoil atoms cause considerable recoil damage, and the ultimate fate of the recoil atoms depends on the thermal chemical reactions which in particular determine the final oxidation state. Hot atom chemistry can help to elucidate the oxidation state of actinide daughters, and to understand the role of media and of the induced radiation damage. These factors determine the leachability and subsequently the migration behavior of the actinide and fission products. The disposal of radwaste may be more appropriate by reducing media than the case of usual matrices of ceramics or glassy material. Useful guidelines were provided by natural events and hot atom chemistry experiments conducted in the laboratory. (K.I.).

16247 (IAERU–9304, pp. 205-215) **Role of charged states in hot atom and radiation chemistry processes.** Arnikar, H.J. (Poona Univ., Pune (India). Dept. of Chemistry). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms.* 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

The primary processes of excitation and ionization of hot atoms in nuclear decay may arise due to the recoil energy they receive at the birth, the outward cascading of the vacancy initially created in the inner shells of atoms, or the shake-off of orbital electron cloud during the perturbation due to the sudden change in the nuclear charge. The present interest is limited to the role of the shake-off process in (n,γ) reactions mainly in condensed systems. The emission or absorption of a nuclear particle or a photon in nuclear process causes the marked effects in the parent atom and in the entire molecule. It was shown that the probability of excitation or ionization of recoil atoms due to shake-off was much greater than that due to the direct collision of an escaping nucleon and an orbital electron. As to the collection of charged products of nuclear reactions, the earlier works in gas phase and the formation of negatively charged species are described. The isotope effect in the overall formation and collection of charged species, the reaction in condensed phase, the later works on the formation of charged species in (n,γ) reactions, quasi-free electrons in nuclear liquids and charged species in sputtering under neutron impact are reported. (K.I.).

16248 (INEL–94/00051) **Development of proposed free release criteria for Idaho National Engineering Laboratory lead.** Losinski, S.J. (EG and G Idaho, Inc., Idaho Falls, ID (United States)). Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-941214–7: 16. US Department of Energy low-level radioactive waste management conference, Phoenix, AZ (United States), 13-15 Dec 1994). Order Number DE95008617. Source: OSTI; NTIS; INIS; GPO Dep.

The INEL Lead Management Project (LMP) performed an investigation of the origin of lead used as shielding at the INEL and developed radiological profile information that was then used to establish a baseline for the DOE "no-rad-added" standard. Primary findings of the investigation include the following: (a) Much of the lead at the INEL was obtained from a DOE lead bank; (b) Lead inventory at the DOE lead bank was derived primarily from recycled sources and was most likely in the form of pure lead; (c) Secondary lead (lead from recycled sources), available in today's market, is expected to have radiological characteristics similar to those of the DOE lead bank; (d) Highly sensitive radiological testing of 20 samples of lead from secondary sources revealed the lead to be radiologically pristine. Beta-, gamma-, and alpha-emitting radionuclide concentrations were all found to be less than detectable, except for a very small quantity of lead-210 (an alpha emitter), which is a naturally occurring isotope of lead. Based on the pristine nature of lead, a proposed free release criterion for lead was developed based on a statistical null hypothesis approach. The free release criterion compares the natural background count of a clean lead standard with the natural background count of a sample. When the sample background count cannot be distinguished as different from the standard background count at the 95% confidence level, then the sample is considered radiologically clean.

16249 (INIS-JP–029, pp. 75-77) **Study on nuclear pyrochemical processing.** Miyashita, Yousuke (Kyoto Univ. (Japan). Faculty of Engineering); Magari, Tadashi; Nagae, Teruhito; Moritani, Kimikazu; Ito, Yasuhiko; Moriyama, Hirotake. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

In support of the development of pyrochemical group partitioning of radioactive wastes, the equilibrium distributions of actinides and lanthanides were measured in the binary phase systems of molten salt and liquid metal. In order to know the effect of the salt phase on the separation factors, Zn was selected for the metal phase, and LiCl-KCl and LiF-BeF_2 were examined for the salt phase. The extractabilities of actinides and lanthanides in the LiCl-KCl/Zn system was observed to be much higher than those in the LiF-BeF_2/Zn. However, no major differences in the separation factors of actinides and lanthanides were observed. (author).

16250 (SINS–2147/2) **Model calculations of ^{111}In production via the ^{112,114,115,116,117}Sn(^{1}H, xnypzα)^{111}Sb → ^{111}Sn → ^{111}In reactions.** Rurarz, E. (Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland)); Mikolajewski, S. Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland). May 1993. 20p. Order Number DE95628577. Source: OSTI; NTIS; INIS.

The possibility of production of no-carrier-added ^{111}In from its grandparent ^{111}Sb via ^{112,114,115,116,117}Sn (^{1}H,xn) ^{111}Sb → ^{111}Sn → ^{111}In reactions and from its parent ^{111}Sn via the ^{112,114,115,116,117}Sn (^{1}H,pxn) ^{111}Sn → ^{111}In reaction is presented here. In addition, production of ^{111}In directly via the ^{112,114,115,116}Sn (^{1}H, αxn ^{2}pxn) ^{111}In reactions is discussed. In this method the contaminant ^{114m}In is not fed during decay of nuclei belonging to A=114 isobaric chain. Starting from the ^{115}Sn target it is possible to produce ^{114}In in reactions of the type (^{1}H, 2pxn), (^{1}H, α) etc. Fortunately, these reactions have low cross sections, not exceeding a few Mb in the maxima of their excitation functions. The excitation functions of reactions leading to ^{111}In mentioned above were calculated in the proton energy range 6-100 MeV using to Overlaid Alice code. These calculations indicate that ^{111}In can be produced with highest cross sections by irradiation of enriched ^{112}Sn target with protons of energy lower than 40 MeV. For the ^{114,115,116,117}Sn targets production of ^{111}In requires beside enriched targets also higher proton energies (E_{1H} > 100 MeV). In order to validate the calculations measurements using 40 and 100 MeV protons would be highly desired, although the calculated cross sections seem to be exact enough, to provide information on contamination by different radioisotopes produced during bombardment by protons. (author). 6 refs, 6 figs, 5 tabs.

16251 (ETDE-DE–72) **Investigations of the inflammability of solutions using the oxygen index process.** Rietz, G.; Schremmer, U.; Wolf, K. Technische Univ. Magdeburg (Germany). Wissenschaftsbereich Sicherheitstechnik. 1993. 21p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 13RG9015. Order Number DE95769291. Source: OSTI; NTIS (US Sales Only).

The investigation was carried out on behalf of the Federal Minister for Research and Technology; it was to find out whether the oxygen index is a satisfactory method of assessing the potential hazard of inflammability of solutions consisting of burnable liquids and water. It was found that, given appropriate experimental conditions, the relative inflammability of such solutions can be determined from the oxygen index. The dependence of the oxygen index on the concentration yields a curve with a potential rise in the range of concentrations that is of interest. With an oxygen index limiting value of 0.30 for the distinction between inflammable and self-extinguishing substances one obtains specific limiting concentrations of inflammability for solutions. Nine liquids were investigated that can be mixed with water. The results are compatible with the results of vat inflammation experiments. (orig.)

16252 (LUTMDN-TMVK–3169) **Doppler Global Velocimetry.** Johansson, Bengt. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Feb 1995. 63p. Order Number DE95766675. Source: OSTI; NTIS.

A new Doppler based technique, Doppler Global Velocimetry (DGV), has been tested. DGV has been applied to a rotating wheel. This has served as a calibration tool to evaluate the linearity and noise level of DGV. The results show that DGV can give accurate velocity measurements under certain specific circumstances. A precision better than 1 m/s has been reached. More work is however needed to make the two used images overlap accurately. A precise overlap is crucial for good system operation. 32 refs, 22 figs

16253 (NEI-SE–196) **Dynamic single particle char combustion and its influence on the fate of fuel bound nitrogen. Numerical modelling and experiments.** Broden, H. Chalmers Univ. of Technology, Goeteborg (Sweden). Dept. of Energy Conversion. Sep 1994. 57p. Order Number DE95766676. Source: OSTI; NTIS.

A numerical char combustion model has been developed and an experimental investigation of the dynamic single char particle combustion process has been made. The numerical model calculates the temperature and gas concentration profiles of O2, CO, CO2, N2, H2O, NO, and N2O in the particle interior and its boundary layer throughout the dynamic carbon conversion process. The experimental investigation includes on-line measurements of O2, CO, CO2, NO and particle temperature. The particle temperature was measured by using a two color pyrometer. Complete temperature histories were measured. The measurements show, and the calculations confirm, that considerable amounts of CO2 are formed heterogeneously. The fuel nitrogen conversions to NO and N2O are primarily determined by the combustion regime. The yields of NO and N2O are higher during kinetically controlled combustion than during diffusionally controlled combustion. Calculations show that the fuel nitrogen conversions to NO and N2O are decreased by an increase in total pressure. Experimentally achieved fuel nitrogen to NO conversions, 35-37% at 5.0 bar and 56-63% at 1.0 bar, and comparisons to calculations indicate that only a minor fraction of fuel nitrogen is converted to N2O. 77 refs, 35 figs, 12 tabs

16254 (SAND–95-8456C) **Effects of gas-phase thermal expansion on the stability of deflagration through a porous energetic material.** Margolis, S.B. (Sandia National Labs., Livermore, CA (United States)); Williams, F.A. Sandia National Labs., Livermore, CA (United States). [1995]. 42p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950720–1: 30. AIAA/SAE/ASME joint propulsion conference and exhibit, San Diego, CA (United States), 10-12 Jul 1995). Order Number DE95004382. Source: OSTI; NTIS; GPO Dep.

The propagation of a deflagration wave through porous energetic materials, as in the case of strictly condensed-phase combustion, is subject to intrinsic diffusional/thermal instabilities that can lead to various oscillatory modes of burning. Under the assumption that the gas phase may be regarded as ideal but quasi-steady, asymptotic analyses are developed for the nonsteady, nonplanar deflagration of porous energetic solids, such as degraded nitramine propellants, that experience significant gas flow in the solid preheat region and are characterized by the presence of exothermic reactions in a bubbling melt layer at their surfaces. Relative motion between the gas and condensed phases is taken into account in both regions, and the derived asymptotic model is analyzed to obtain an explicit solution for steady, planar deflagration and a dispersion relation describing its linear stability. The present analysis parallels a similar study by the authors that allowed for a fully nonsteady gas phase, but neglected the effects of gas-phase thermal expansion. Nonetheless, qualitatively similar results are obtained, predicting a pulsating neutral stability boundary in the nondimensional activation energy - disturbance wavenumber plane beyond which nonsteady, nonplanar solutions are anticipated. Focusing on the realistic limit of small ratios of gas-phase to condensed-phase density and thermal conductivity, it is demonstrated that the effect of a nonzero porosity a, of the unburned solid material is generally destabilizing. The effect of gas-phase thermal expansion is also shown to be destabilizing, further suggesting that degraded propellants, which exhibit greater porosity than the pristine material, may be especially prone to nonsteady deflagration.

16255 (UCRL-JC–119485) **Particle filtration: A comparison between theory and experiment.** Quintard, M. (L.E.P.T.-ENSAM (UA CNRS), Talence (France)); Whitaker, S. California Univ., Davis, CA (United States). Dept. of Chemical Engineering and Materials Science. Dec 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410330–1: Encontro sobre escoamento em meios porosos, Floriaopolis (Brazil), 19-21 Oct 1994). Order Number DE95009442. Source: OSTI; NTIS; GPO Dep.

The process of filtration of non-charged, submicron particles represents an example of transport in homogeneous and heterogeneous porous media that can be analyzed using the method of volume averaging. In this article the authors develop the local volume averaged particle transport equation for a homogeneous filter and compare the results with experimental data. The particle continuity equation is represented in terms of the first correction to the Smoluchowski equation that takes into account particle inertia effects for small Stokes numbers. This leads to a cellular efficiency that contains a minimum in the efficiency as a function of the particle size, and this allows them to identify the most penetrating particle size. Comparison of the theory with experimental results indicates that the first correction to the Smoluchowski equation gives reasonable results for the most penetrating particle size and for smaller particles; however, results for larger particles clearly indicate the need to extend the Smoluchowski equation to include higher order corrections. The influence of local heterogeneities on the measured filter efficiency may account for some of the observed differences between theory and experiment.

16256 (ANL/RA/CP–84371) **Criticality control during conditioning of spent nuclear fuel in the Fuel Cycle Facility.** Lell, R.M. (Argonne National Lab., IL (United States). Reactor Analysis Div.); Khalil, H.S. Argonne National Lab., IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–35: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95009898. Source: OSTI; NTIS; INIS; GPO Dep.

Spent nuclear fuel may be unacceptable for direct repository storage because of composition, enrichment, form, physical condition, or the presence of undesirable materials such as sodium. Fuel types which are not acceptable for direct storage must be processed or conditioned to produce physical forms which can safely be stored in a repository. One possible approach to conditioning is the pyroprocess implemented in the Fuel Cycle Facility (FCF) at Argonne National Laboratory-West. Conditioning of binary (U-Zr) and ternary (U-Pu-Zr) metallic fuels from the EBR-2 reactor is used to demonstrate the process. Criticality safety considerations limit batch sizes during the conditioning steps and provide one constraint on the final form of conditioned material. Criticality safety during conditioning is assured by the integration of criticality safety analysis, equipment design, process development, a measurement program, accountability procedures, and a computerized Mass Tracking System. Criticality issues related to storage and shipment of conditioned material have been examined.

16257 (BNL–61540) **Cylindrical shell buckling through strain hardening.** Bandyopadhyay, K. (Brookhaven National Lab., Upton, NY (United States)); Xu, J.; Shteyngart, S.; Gupta, D. Brookhaven National Lab., Upton, NY (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–25: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95009545. Source: OSTI; NTIS; GPO Dep.

Recently, the authors published results of plastic buckling analysis of cylindrical shells. Ideal elastic-plastic material behavior was used for the analysis. Subsequently, the buckling analysis program was continued with the realistic stress-strain relationship of a stainless steel alloy which does not exhibit a clear yield point. The plastic buckling analysis was carried out through the initial stages of strain hardening for various internal pressure values. The computer program BOSOR5 was used for this purpose. Results were compared with those obtained from the idealized elastic-plastic relationship using the offset stress level at 0.2% strain as the yield stress. For moderate hoop stress values, the realistic stress-grain

case shows a slight reduction of the buckling strength. But, a substantial gain in the buckling strength is observed as the hoop stress approaches the yield strength. Most importantly, the shell retains a residual strength to carry a small amount of axial compressive load even when the hoop stress has exceeded the offset yield strength.

16258 (CONF-950601–1) **Criticality safety aspects of K-25 Building uranium deposit removal.** Haire, M.J. (Oak Ridge National Lab., TN (United States)); Jordan, W.C.; Ingram, J.C. III; Stinnet, E.C. Jr. Oak Ridge K-25 Site, TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. From Annual meeting of the American Nuclear Society; Philadelphia, PA (United States); 25-29 Jun 1995. Order Number DE95003445. Source: OSTI; NTIS; INIS; GPO Dep.

The K-25 Building of the Oak Ridge Gaseous Diffusion Plant (now the K-25 Site) went into operation during World War II as the first large scale production plant to separate ^{235}U from uranium by the gaseous diffusion process. It operated successfully until 1964, when it was placed in a stand-by mode. The Department of Energy has initiated a decontamination and decommissioning program. The primary objective of the Deposit Removal (DR) Project is to improve the nuclear criticality safety of the K-25 Building by removing enriched uranium deposits from unfavorable-geometry process equipment to below minimum critical mass. The method utilized to accomplish this are detailed in this report.

16259 (CONF-950601–6) **Criticality safety considerations for low-level-waste facilities.** Hopper, C.M. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the American Nuclear Society; Philadelphia, PA (United States); 25-29 Jun 1995. Order Number DE95009072. Source: OSTI; NTIS; INIS; GPO Dep.

The nuclear criticality safety for handling and burial of certain special nuclear materials (SNM) at low-level-waste (LLW) facilities is licensed by the US Nuclear Regulatory Commission (NRC). Recently, Oak Ridge National Laboratory (ORNL) staff assisted the NRC Office of Nuclear Material Safety and Safeguards, Low-Level-Waste and Decommissioning Projects Branch, in developing technical specifications for the nuclear criticality safety of ^{235}U and ^{235}Pu in LLW facilities. This assistance resulted in a set of nuclear criticality safety criteria that can be uniformly applied to the review of LLW package burial facility license applications. These criteria were developed through the coupling of the historic surface-density criterion with current computational technique to establish safety criteria considering SNM material form and reflector influences. This paper presents a summary of the approach used to establish and to apply the criteria to the licensing review process.

16260 (CONF-950601–7) **Maintaining scale as a reliable computational system for criticality safety analysis.** Bowmann, S.M.; Parks, C.V.; Martin, S.K. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the American Nuclear Society; Philadelphia, PA (United States); 25-29 Jun 1995. Order Number DE95009071. Source: OSTI; NTIS; INIS; GPO Dep.

Accurate and reliable computational methods are essential for nuclear criticality safety analyses. The SCALE (Standardized Computer Analyses for Licensing Evaluation) computer code system was originally developed at Oak Ridge National Laboratory (ORNL) to enable users to easily set up and perform criticality safety analyses, as well as shielding, depletion, and heat transfer analyses. Over the fifteen-year life of SCALE, the mainstay of the system has been the criticality safety analysis sequences that have featured the KENO-IV and KENO-V.A Monte Carlo codes and the XSDRNPM one-dimensional discrete-ordinates code. The criticality safety analysis sequences provide automated material and problem-dependent resonance processing for each criticality calculation. This report details configuration management which is essential because SCALE consists of more than 25 computer codes (referred to as modules) that share libraries of commonly used subroutines. Changes to a single subroutine in some cases affect almost every module in SCALE! Controlled access to program source and executables and accurate documentation of modifications are essential to maintaining SCALE as a reliable code system. The modules and subroutine libraries in SCALE are programmed by a staff of approximately ten Code Managers. The SCALE Software Coordinator maintains the SCALE system and is the only person who modifies the production source, executables, and data libraries. All modifications must be authorized by the SCALE Project Leader prior to implementation.

16261 (CONF-950740–3) **Buckling analysis of an underground storage tank on the Oak Ridge Reservation.** Rezvani, M.A.; Webb, D.S. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95005900. Source: OSTI; NTIS; INIS; GPO Dep.

Many tanks are stored underground on the Oak Ridge Reservation in the state of Tennessee. The construction of some of these tanks dates back to the 1940s. A major Department of Energy (DOE) initiative is to assess the integrity of these existing tanks. These tanks must be analyzed and evaluated to ensure the safety of workers, the public, and the environment. This paper presents the results of a buckling analysis for two horizontal tanks in an underground vault. The tanks are 3.7 m (12.0 ft) in diam, 18.7 m (61.4 ft) long, and supported on two saddles. The analysis addresses different loading scenarios to complement the safety evaluation of these tanks. The loading conditions consider empty and half-full tanks in the vault flooded with either waste material or flood water to different heights. The results indicate that the tank will neither yield nor buckle for flood water of 5.5 m (18.0 ft) above the tank top.

16262 (JINR-R–10-94-379) **Microcontroller Unit.** Tulaev, A.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 7p. (In Russian). Order Number DE95627029. Source: OSTI; NTIS (US Sales Only); INIS.

The general purpose micro controller unit based on 8-bit single-chip microcomputer of the MCS-51 family is described. The controller has the data and program memories, a serial interface and an external bus for functional I/O extensions. The controller consists of a microcomputer chip, up to 4 ROM-RAM chips and 10 SSI and MSI chips, and it measures 160x120 mm. Both hardware and software micro system debugging tools are described. (author). 8 refs., 1 fig., 1 tab.

16263 (LA-UR–95-47) **Bolt preload selection for pulsed-loaded vessel closures.** Duffey, T.A.; Lewis, B.B.; Bowers, S.M. Los Alamos National Lab., NM (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950740–9: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95006346. Source: OSTI; NTIS; GPO Dep.

Bounding, closed-form solutions are developed for selecting the bolt preload for a square, flat plate closure subjected to a pressure pulse load. The solutions consider the limiting case in which preload is primarily dependent on closure bending response as well as the limiting case in which preload depends on elastic bolt response. The selection of bolt preload is illustrated. Also presented in the paper is a detailed finite element analysis of dynamically loaded, bolted circular closure. The responses of the structure, closure, and bolts are included, and results are obtained for various preloads. The analysis illustrates a method of bolt preload modeling for use in general finite element computer programs.

16264 (LBL-PUB–754) **The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.** Cross, J. (ed.). Lawrence Berkeley Lab., CA (United States). Feb 1995. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

This is a collection of technical papers and personal remembrances written expressly for the Halbach Symposium and dedicated to Klaus Halbach. The topics presented offer a hint of

the diversity of Klaus's scientific career. Most of the papers deal with magnets for accelerators and accelerator facilities. Other topics covered are free electron lasers, Halbach array motor/generators, radiation and gas conduction heat transport across a dewar multilayer insulation system, and surface structural determination from Fourier transforms of angle-resolved photoemission extended fine structure. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

16265 (LBL-PUB–755) **The art and science of magnet design: Selected notes of Klaus Halbach. Volume 2.** Lawrence Berkeley Lab., CA (United States). Feb 1995. 262p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95008450. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains a compilation of 57 notes written by Dr. Klaus Halbach selected from his collection of over 1650 such documents. It provides an historic snapshot of the evolution of magnet technology and related fields as the notes range from as early as 1965 to the present, and is intended to show the breadth of Dr. Halbach's interest and ability that have long been an inspiration to his many friends and colleagues. As Halbach is an experimental physicist whose scientific interests span many areas, and who does his most innovative work with pencil and paper rather than at the workbench or with a computer, the vast majority of the notes in this volume were handwritten and their content varies greatly–some reflect original work or work for a specific project, while others are mere clarifications of mathematical calculations or design specifications. As the authors converted the notes to electronic form, some were superficially edited and corrected, while others were extensively re-written to reflect current knowledge and notation. The notes are organized under five categories which reflect their primary content: Beam Position Monitors, (bpm), Current Sheet Electron Magnets (csem), Magnet Theory, (thry), Undulators and Wigglers (u-w), and Miscellaneous (misc). Within the category, they are presented chronologically starting from the most recent note and working backwards in time.

16266 (NEI-NO–547) **Major aspects of cost effective satellite field developments.** Lindland, H.J. (Statoil (Norway)); Klemp, S. Norsk Petroleumsforening, Oslo (Norway). 1994. 18p. (CONF-9408229–54: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766623. Source: OSTI; NTIS.

The role of the paper is to provide a background and overview of todays state-of-the-art within the multiphase technology (MP). The emphasis is on the North Sea relevant challenges, but with a close link to future deepwater developments. Economics is touched on throughout the paper, with emphasis on major cost saving elements involved with the use of MP technology for satellite developments. 21 refs.

16267 (NEI-NO–550) **Chemical inhibition of carbon steel lines.** Stevens, C. (Exxon Chemical Norden (Norway)); Hedges, W.M.; Haslegrave, J.A. Norsk Petroleumsforening, Oslo (Norway). 1994. 11p. (CONF-9408229–57: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766626. Source: OSTI; NTIS.

In recent years the offshore oil industry has seen a move towards either unmanned platforms or subsea completions. The primary reasons for this are cost and safety. One of the consequences of this is that there is little or no processing of the produced fluids close to the wellhead. Thus an increasing number of pipelines have to carry multiphase fluids. Many of these fluids are from marginal fields and can contain high levels of carbon dioxide or hydrogen sulphide at elevated temperatures. This makes the fluids highly corrosive. Under such conditions there is a need for corrosion control. An early decision that the operator must make is whether to fabricate the pipelines from corrosion resistant alloy or use carbon steel with a corrosion inhibitor treatment. The present paper discusses some of the issues which contribute to the decision making process. 4 refs., 3 tabs.

16268 (NEI-NO–551) **Internal corrosion management and material selection in multiphase transport lines.** Lunde, L. (Institutt for Energiteknikk, Kjeller (Norway)); Dugstad, A. Norsk Petroleumsforening, Oslo (Norway). 1994. 21p. (CONF-9408229–58: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766627. Source: OSTI; NTIS.

External corrosion control of the pipeline seawater side is well understood and is easily managed by proper surface protection and anode design. The material loss on the inside due to CO_2-corrosion may, however, be a limiting factor for the use of carbon steels in pipelines for unprocessed or partly processed hydrocarbons. The phenomena associated with material loss in a multiphase pipeline is very complex, involving the chemistry of the pipeline fluids, the metallurgy of the pipeline material and the pipeline hydraulics, which all interact in a complex way. Inhibition of corrosion and inhibitor distribution along the pipeline are also fields of special concern. The present paper gives a brief description of some of the fields which are developed or being considered for transport of unprocessed hydrocarbons in the Norwegian sector of the North Sea, and new aspects of internal corrosion management of flow or pipelines for specific fields are being discussed. 18 refs., 6 figs., 2 tabs.

16269 **Lead-free glovebox glove.** Villarreal, R.; Phillips, J.R.; Olivas, J.D.; Stalnaker, N.D. To Dept. of Energy. 1993. Filed date 17 Mar 1993. U.S. Patent Application 8-032,936. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009980. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a lead-free glovebox glove. For certain applications, currently used glovebox gloves that contain lead, which is a RCRA-identified toxic metal, as an attenuation medium can be replaced by gloves containing a blend of bismuth and rare-earth oxides which are not RCRA-hazardous metals. The present invention includes the use of these oxides embedded in soft plastic as internal layers of glovebox gloves for the absorption and attenuation of α-particles, β-particles, characteristic x-rays, and 60 and 100 keV γ-rays arising from the use of enriched Pu and Pu containing ^{241}Am.

16270 **Fabric panel clean change-out frame.** Brown, R.M. To Dept. of Energy. 1993. Filed date 18 Mar 1993. U.S. Patent Application 8-033,473. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-89PN38014. Order Number DE95009981. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a fabric panel clean change-out frame, for use on a containment structure having rigid walls, is formed of a compression frame and a closure panel. The frame is formed of elongated spacers, each carrying a plurality of closely spaced flat springs, and each having a hooked lip extending on the side of the spring facing the spacer. The closure panel is includes a perimeter frame formed of flexible, wedge-shaped frame members that are receivable under the springs to deflect the hooked lips. A groove on the flexible frame members engages the hooked lips and locks the frame members in place under the springs. A flexible fabric panel is connected to the flexible frame members and closes its center.

16271 (SAND–94-2270C) **Microfabricated actuators and their application to optics.** Sniegowski, J.J.; Garcia, E.J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–21: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95008156. Source: OSTI; NTIS; GPO Dep.

Several authors have given overviews of microelectromechanical systems, including microactuators. In our presentation we will review some of these results, and provide a brief description of the basic principles of operation, fabrication, and application, of a few selected microactuators (electrostatic and surface tension driven). We present a description of a three-level mechanical polysilicon surface-micromachining technology with a discussion of the advantages of this level of process complexity. This technology, is

capable of forming complex, batch-fabricated, interconnected, and interactive, microactuated micromechanisms which include optical elements. The inclusion of a third deposited layer of mechanical polysilicon greatly extends the degree of complexity available for micromechanism design. Two examples of microactuators fabricated using this process are provided to illustrate the capabilities and usefulness of the technology. The first actuator is an example of a novel actuation mechanism based on the effect of surface tension at these micro-scale dimensions and of a microstructure within a microstructure. The second is a comb-drive-based microengine which has direct application as a drive and power source for micro optical elements, specifically, micro mirrors and micro shutters. This design converts linear oscillatory motion from electrostatic comb drive actuators into rotational motion via a direct linkage connection. The microengine provides output in the form of a continuously rotating output gear that is capable of delivering drive torque to a micromechanism.

16272 (SAND–94-2409C) **Effects of mixed waste simulants on transportation packaging plastic components.** Nigrey, P.J.; Dickens, T.G. Sandia National Labs., Albuquerque, NM (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950646–3: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95006305. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of hazardous and radioactive materials packaging is to, enable these materials to be transported without posing a threat to the health or property of the general public. To achieve this aim, regulations have been written establishing general design requirements for such packagings. While no regulations have been written specifically for mixed waste packaging, regulations for the constituents of mixed wastes, i.e., hazardous and radioactive substances, have been codified. The design requirements for both hazardous and radioactive materials packaging specify packaging compatibility, i.e., that the materials of the packaging and any contents be chemically compatible with each other. Furthermore, Type A and Type B packaging design requirements stipulate that there be no significant chemical, galvanic, or other reaction between the materials and contents of the package. Based on these requirements, a Chemical Compatibility Testing Program was developed in the Transportation Systems Department at Sandia National Laboratories (SNL). The program, supported by the US Department of Energy's (DOE) Transportation Management Division, EM-261 provides the means to assure any regulatory body that the issue of packaging material compatibility towards hazardous and radioactive materials has been addressed. In this paper, we describe the general elements of the testing program and the experimental results of the screening tests. The implications of the results of this testing are discussed in the general context of packaging development. Additionally, we present the results of the first phase of this experimental program. This phase involved the screening of five candidate liner and six seal materials against four simulant mixed wastes.

16273 (SAND–94-2485C) **Thermal testing of packages for transport of radioactive wastes.** Koski, J.A. Sandia National Labs., Albuquerque, NM (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950646–10: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95008435. Source: OSTI; NTIS; INIS; GPO Dep.

Shipping containers for radioactive materials must be shown capable of surviving tests specified by regulations such as Title 10, Code of Federal Regulations, Part 71 (called 10CFR71 in this paper) within the United States. Equivalent regulations hold for other countries such as Safety Series 6 issued by the International Atomic Energy Agency. The containers must be shown to be capable of surviving, in order, drop tests, puncture tests, and thermal tests. Immersion testing in water is also required, but must be demonstrated for undamaged packages. The thermal test is intended to simulate a 30 minute exposure to a fully engulfing pool fire that could occur if a transport accident involved the spill of large quantities of hydrocarbon fuels. Various qualification methods ranging from pure analysis to actual pool fire tests have been used to prove regulatory compliance. The purpose of this paper is to consider the alternatives for thermal testing, point out the strengths and weaknesses of each approach, and to provide the designer with the information necessary to make informed decisions on the proper test program for the particular shipping container under consideration. While thermal analysis is an alternative to physical testing, actual testing is often emphasized by regulators, and this report concentrates on these testing alternatives.

16274 (SAND–94-2637C) **Simulation of hypervelocity impact on massively parallel supercomputer.** Fang, H.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950788–7: International conference on computational engineering science, Mauna Lani, HI (United States), 30 Jul - 3 aug 1995). Order Number DE95007735. Source: OSTI; NTIS; GPO Dep.

Hypervelocity impact studies are important for debris shield and armor/anti-armor research and development. Numerical simulations are frequently performed to complement experimental studies, and to evaluate code accuracy. Parametric computational studies involving material properties, geometry and impact velocity can be used to understand hypervelocity impact processes. These impact simulations normally need to address shock wave physics phenomena, material deformation and failure, and motion of debris particles. Detailed, three-dimensional calculations of such events have large memory and processing time requirements. At Sandia National Laboratories, many impact problems of interest require tens of millions of computational cells. Furthermore, even the inadequately resolved problems often require tens or hundred of Cray CPU hours to complete. Recent numerical studies done by Grady and Kipp at Sandia using the Eulerian shock wave physics code CTH demonstrated very good agreement with many features of a copper sphere-on-steel plate oblique impact experiment, fully utilizing the compute power and memory of Sandia's Cray supercomputer. To satisfy requirements for more finely resolved simulations in order to obtain a better understanding of the crater formation process and impact ejecta motion, the numerical work has been moved from the shared-memory Cray to a large, distributed-memory, massively parallel supercomputing system using PCTH, a parallel version of CTH. The current work is a continuation of the studies, but done on Sandia's Intel 1840-processor Paragon X/PS parallel computer. With the great compute power and large memory provided by the Paragon, a highly detailed PCTH calculation has been completed for the copper sphere impacting steel plate experiment. Although the PCTH calculation used a mesh which is 4.5 times bigger than the original Cray setup, it finished in much less CPU time.

16275 (SAND–95-0582C) **Dynamic pulse buckling of cylindrical shells under axial impact: A benchmark study of 2D and 3D finite element calculations.** Hoffman, E.L.; Ammerman, D.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950740–26: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95009858. Source: OSTI; NTIS; INIS; GPO Dep.

A series of tests investigating dynamic pulse buckling of a cylindrical shell under axial impact is compared to several 2D and 3D finite element simulations of the event. The purpose of the work is to investigate the performance of various analysis codes and element types on a problem which is applicable to radioactive material transport packages, and ultimately to develop a benchmark problem to qualify finite element analysis codes for the transport package design industry. During the pulse buckling tests, a buckle formed at each end of the cylinder, and one of the two buckles became unstable and collapsed. Numerical simulations of the test were performed using PRONTO, a Sandia developed transient dynamics analysis code, and ABAQUS/Explicit with both shell and continuum elements. The calculations are compared to the tests with respect to deformed shape and impact load history.

16276 (SAND–95-0610C) **A collision avoidance system for workpiece protection.** Schmitt, D.J. (Sandia National Labs., Albuquerque, NM (United States)); Weber, T.M.; Novak, J.L.;

Maslakowski, J.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505169–2: International robots and vision automation show and conference, Detroit, MI (United States), 8-11 May 1995). Order Number DE95009842. Source: OSTI; NTIS; GPO Dep.

This paper describes an application of Sandia's non-contact capacitive sensing technology for collision avoidance during the manufacturing of rocket engine thrust chambers. The collision avoidance system consists of an octagon shaped collar with a capacitive proximity sensor mounted on each face. The sensors produced electric fields which extend several inches from the face of the collar and detect potential collisions between the robot and the workpiece. A signal conditioning system processes the sensor output and provides varying voltage signals to the robot controller for stopping the robot.

16277 (SAND–95-0662C) **Thermal measurements to characterize large fires.** Gritzo, L.A. (Sandia National Labs., Albuquerque, NM (United States)); Gill, W.; Keltner, N. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505201–1: 41. international instrumentation symposium, Denver, CO (United States), 7-11 May 1995). Order Number DE95009860. Source: OSTI; NTIS; GPO Dep.

Full-scale fire characterization tests are becoming less frequent due to cost restrictions and environmental concerns. This trend, combined with significant advances in fire field modeling, has resulted in an increased effort to perform well-designed experiments which support the development and validation of numerical tools. In pursuit of improved fire characterization, large-fire measurement techniques in large-scale (D > 2m) fires are reviewed in this work. Primary attention is focused on the measurement of temperature and heat flux. Additional measurements of quantities such as soot volume fraction, soot emission temperature, and gas species are also addressed. Issues relating to the use of existing techniques, and methods for improving and interpreting the results from existing measurement techniques are presented. Alternate techniques for fire characterization and needs for development of advanced measurement technology are also briefly discussed.

16278 (SAND–95-8214) **4,4′-Methylene Dianiline (MDA) and thermal abuse of Rigid Polyurethane Foam.** Lari, P. Sandia National Labs., Livermore, CA (United States). Mar 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010342. Source: OSTI; NTIS; GPO Dep.

Rigid Polyurethane Foam is used for weapon support in conjunction with the H1501A Transportation Accident Resistant Container (TARC). The foam is flame resistant, however like all organic materials, it will burn with enough heat and oxygen. Normally the foam will not melt, but will form a char and is nonhazardous. There are instances when the combination of heat and oxygen will cause the foam to decompose resulting in 4,4′-Methylene Dianiline (MDA) a Liver toxin and suspect carcinogen. MDA contamination occurred during robustness tests DROP-20/BURN-20. This report chronicles the events causing the contamination and method used for disposal.

16279 (UCRL-ID–119071) **Radar imagery from the 1994 Loch Linnhe trials.** Lehman, S.K. (Lawrence Livermore National Lab., CA (United States)); Mullenhoff, C.J.; Jones, H.; Berry, G.; Newman, M.J.; Lamont-Smith, T.; Hirst, P.; Ward, K. Lawrence Livermore National Lab., CA (United States). 26 Oct 1994. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010662. Source: OSTI; NTIS; GPO Dep.

The 1994 Loch Linnhe radar ocean imaging trials were held from September 4 through September 17. Two ships were used: the R.V. Colonel Templer, and the RMAS Collie. Thorn EMI, Inc., fielded a dual band, dual polarization radar on a hillside overlooking the loch. We present here the imagery for all but one of the ship runs.

16280 (UCRL-JC–115893) **Preliminary field evaluation of high efficiency steel filters.** Bergman, W. (Lawrence Livermore National Lab., CA (United States)); Larsen, G.; Lopez, R.; Wilson, K.; Simon, K.; Frye, L. Lawrence Livermore National Lab., CA (United States). Nov 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940738–11: 23. DOE/NRC nuclear air cleaning and treatment conference, Buffalo, NY (United States), 25-28 Jul 1994). Order Number DE95009465. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have conducted an evaluation of two high efficiency steel filters in the exhaust of an uranium oxide grit blaster at the Y-12 Plant in Oak Ridge Tennessee. The filters were installed in a specially designed filter housing with a reverse air-pulse cleaning system for automatically cleaning the filters in-place. Previous tests conducted on the same filters and housing at LLNL under controlled conditions using Arizona road dust showed good cleanability with reverse air pulses. Two high efficiency steel filters, containing 64 pleated cartridge elements housed in the standard 2′ x 2′ x l′ HEPA frame, were evaluated in the filter test housing using a 1,000 cfm slip stream containing a high concentration of depleted uranium oxide dust. One filter had the pleated cartridges manufactured to the authors specifications by the Pall Corporation and the other by Memtec Corporation. Test results showed both filters had a rapid increase in pressure drop with time, and reverse air pulses could not decrease the pressure drop. The authors suspected moisture accumulation in the filters was the problem since there were heavy rains during the evaluations, and the pressure drop of the Memtec filter decreased dramatically after passing clean, dry air through the filter and after the filter sat idle for one week. Subsequent laboratory tests on a single filter cartridge confirmed that water accumulation in the filter was responsible for the increase in filter pressure drop and the inability to lower the pressure drop by reverse air pulses. No effort was made to identify the source of the water accumulation and correct the problem because the available funds were exhausted.

16281 (UCRL-JC–118797-Rev.1) **A probabilistic risk assessment of the LLNL Plutonium Facility's evaluation basis fire operational accident. Revision 1.** Brumburgh, G.P. Lawrence Livermore National Lab., CA (United States). 27 Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950740–1-Rev.1: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95009529. Source: OSTI; NTIS; INIS; GPO Dep.

The Lawrence Livermore National Laboratory (LLNL) Plutonium Facility conducts numerous programmatic activities involving plutonium to include device fabrication, development of improved and/or unique fabrication techniques, metallurgy research, and laser isotope separation. A Safety Analysis Report (SAR) for the building 332 Plutonium Facility was completed in July 1994 to address operational safety and acceptable risk to employees, the public, government property, and the environmental. This paper outlines the PRA analysis of the Evaluation Basis Fire (EBF) operational accident. The EBF postulates the worst-case programmatic impact event for the Plutonium Facility.

16282 (WHC-SA–2804) **Performance testing of a system for remote ultrasonic examination of the Hanford double-shell waste storage tanks.** Pfluger, D.C. (Westinghouse Hanford Co., Richland, WA (United States)); Somers, T.; Berger, A.D. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216–112: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008030. Source: OSTI; NTIS; INIS; GPO Dep.

A mobile robotic inspection system is being developed for remote ultrasonic examination of the double wall waste storage tanks at Hanford. Performance testing of the system includes demonstrating robot mobility within the tank annulus, evaluating the accuracy of the vision based navigation process, and verifying ultrasonic and video system performance. This paper briefly describes the system and presents a summary of the plan for performance testing of the ultrasonic testing system. Performance test results will be presented at the conference.

16283 (WHC-SD-SQA-CSA–20390-Rev.1) **CSER 90-006, addendum 1: Criticality safety control for source term reduction**

project in the scrubber glovebox of Building 232-Z. Revision 1. Hess, A.L. Westinghouse Hanford Co., Richland, WA (United States). 10 Mar 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009149. Source: OSTI; NTIS; INIS; GPO Dep.

This Criticality Safety Evaluation Report addendum extends the coverage of the original CSER (90-006) about dismantling the ductwork in 232-Z to include cleanout of the Scrubber Glovebox, with an estimated residual Pu holdup of less than 200 grams. For conservatism and containment considerations, the provisions about waste packaging and water exclusion from the original work are retained, even though it is not credible for the Scrubber Pu content to be made critical with water added (NDA gives about 1/3 a minimum critical mass).

16284 (WHC-SD-TP-OMM–002) **Operating and maintenance instructions for the Hedgehog sample package (A DOT 7A Type A Package).** Edwards, W.S. Westinghouse Hanford Co., Richland, WA (United States). 7 Apr 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010191. Source: OSTI; NTIS; INIS; GPO Dep.

The Operating and Maintenance Instructions for the HEDGEHOG Sample Package describe the sequence of operations required to use this package as a US Department of Transportation (DOT) Requirements Specification 7A, Type A package for radioactive materials (RAM). This instruction includes air shipment in accordance with the International Air Transport Association (IATA) Dangerous Goods Regulations, as well as the DOT. This package can be used to ship up to one liter of radioactive liquid without shielding and up to 250 ml of radioactive liquid that requires shielding.

16285 (WHC-SD-W059-FHA–001) **Preliminary Fire Hazards Analysis for W-059, B Plant canyon ventilation upgrade.** Condron, J.D.; Roege, P.E. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010577. Source: OSTI; NTIS; INIS; GPO Dep.

This Preliminary Fire Hazards Analysis determines the fire hazards associated with the W-059, B Plant canyon ventilation upgrade project.

16286 (WSRC-MS–94-0544) **Exposure rate response analysis of criticailty accident dectector at Savannah River Site.** Zino, J.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950601–2: Annual meeting of the American Nuclear Society, Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95004801. Source: OSTI; NTIS; INIS; GPO Dep.

This analysis investigated the exposure response behavior of gamma-ray ionization chambers used in the criticality accident systems at the Savannah River Site (SRS). The project consisted of performing exposure response measurements with a calibrated ^{137}Cs source for benchmarking of the MCNP Monte Carlo code. MCNP was then used to extrapolate the ion chamber's response to gamma-rays with energies outside the current domain of measured data for criticality fission sources.

4204 Heat Transfer and Fluid Flow

16287 (ANL–95/6) **First assessment of computations of turbulent bubbly flow and particulate flow with the COMMIX-M program.** Bottoni, M. (Argonne National Lab., IL (United States). Energy Technology Div.); Chang, F.C.; Ding, J. Argonne National Lab., IL (United States). May 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95009035. Source: OSTI; NTIS; GPO Dep.

The COMMIX-M computer code, which describes steady-state and transient single- and multicomponent flows in engineering systems, has been implemented to simulate suspension flows in laminar regimes and turbulent and bubbly particulate flows. This report presents a synopsis of the present code's capabilities, with particular emphasis on the recent development of turbulence models, and explains in detail the modifications necessary to simulate particulate flows and bubbly flows. First results of computations of turbulent bubbly and particulate flows are then given and compared with results of computations reported in the literature and with preliminary experimental results obtained at the Kernforschungszentrum Karlsruhe (Germany).

16288 (DOE/ER/13034–2) **General particle transport equation. Final report.** Lafi, A.Y.; Reyes, J.N. Jr. Oregon State Univ., Corvallis, OR (United States). Dept. of Nuclear Engineering. Dec 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER13034. (OSU-NE–9409). Order Number DE95009679. Source: OSTI; NTIS; INIS; GPO Dep.

The general objectives of this research are as follows: (1) To develop fundamental models for fluid particle coalescence and breakage rates for incorporation into statistically based (Population Balance Approach or Monte Carlo Approach) two-phase thermal hydraulics codes. (2) To develop fundamental models for flow structure transitions based on stability theory and fluid particle interaction rates. This report details the derivation of the mass, momentum and energy conservation equations for a distribution of spherical, chemically non-reacting fluid particles of variable size and velocity. To study the effects of fluid particle interactions on interfacial transfer and flow structure requires detailed particulate flow conservation equations. The equations are derived using a particle continuity equation analogous to Boltzmann's transport equation. When coupled with the appropriate closure equations, the conservation equations can be used to model nonequilibrium, two-phase, dispersed, fluid flow behavior. Unlike the Eulerian volume and time averaged conservation equations, the statistically averaged conservation equations contain additional terms that take into account the change due to fluid particle interfacial acceleration and fluid particle dynamics. Two types of particle dynamics are considered; coalescence and breakage. Therefore, the rate of change due to particle dynamics will consider the gain and loss involved in these processes and implement phenomenological models for fluid particle breakage and coalescence.

16289 (DTU-ISVA-PR–75) **Progress report no. 75.** Danmarks Tekniske Univ., Lyngby (Denmark). Inst. for Stroemningsmekanik og Vandbygning. 1994. 82p. Order Number DE95766444. Source: OSTI; NTIS.

The progress report no. 75 of the Danish Institute of Hydrodynamics and Hydraulic Engineering consists of 5 contributions dealing with turbulence modelling over 2-dimensional bed forms, in a Borda outlet and in semi-3d flow, velocity profiles in spilling breakers etc. (EG)

16290 (ETDE-DE–87) **A parametric study of film condensation of pure gases and mixtures with non-condensable gas in a shock tube.** Max-Planck-Institut fuer Stroemungsforschung. Bericht, v. 24/1994. Teske, T. Max-Planck-Institut fuer Stroemungsforschung, Goettingen (Germany). Dec 1994. 219p. (In German). Order Number DE95769847. Source: OSTI; NTIS (US Sales Only).

Experiments on film condensation of pure gases and mixtures with nitrogen in a shock tube are presented. Gases under investigation are methanol, ethanol, n-heptane and mixtures of ethanol and nitrogen. The time dependent thickness of condensing liquid layers has been measured on the end and side walls of the driven section by means of an interferometric method. For the first time the growth on a non-transparent end wall made of steel has been observed. Growth rates obtained using a quartz respectively a steel substrate demonstrate the strong dependence on the thermal conductivity of the wall. Measurement series having a common initial state for fixed phase change number and different fraction of non-condensable gas and vice versa exhibit the nearly independent influence of both parameters. The quantitative effect of the fraction of non-condensable gas has been studied down to partial pressure ratios of 400:1. The growth rate is influenced strongly by the fraction of non-condensable gas. Simple formulas, describing the dependence on phase change number and amount of non-condensable gas are given for growth rates at the end wall as well as at the side wall behind the incoming shock. (orig.)

16291 (JAERI-Conf–94-006) **Abstracts of the Mini-Symposium on Stability and Bifurcation in Fluid Motions September 9-10, 1994, Tokai, Japan.** Fujimura, Kaoru (ed.)

(Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1995. 50p. Order Number DE95767955. Source: OSTI; NTIS; INIS.

This is the abstracts of the Mini-Symposium on Stability and Bifurcation in Fluid Motions held on September 9-10, 1994 at the Tokai Establishment of JAERI and the Tokai Kaikan. Sixteen talks were given on various important subjects related with stability and bifurcation phenomena in fluids. All of them are theoretical and numerical analyses involving linear stability analysis, weakly nonlinear analysis, bifurcation analysis, and direct computation of nonlinearly equilibrium solutions. (author).

16292 (SAND–94-1735C) **Velocity boundary conditions for vorticity formulations of the incompressible Navier-Stokes equations.** Kempka, S.N. (Sandia National Labs., Albuquerque, NM (United States)); Strickland, J.H.; Glass, M.W.; Peery, J.S.; Ingber, M.S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950283–1: Application of vortex methods to engineering problems forum, Albuquerque, NM (United States), 22-24 Feb 1995). Order Number DE95008715. Source: OSTI; NTIS; GPO Dep.

Velocity boundary conditions for the vorticity form of the incompressible, viscous fluid momentum equations are presented. Vorticity is created on boundaries to simultaneously satisfy the tangential and normal components of the velocity boundary condition. The newly created vorticity is specified by a kinematical formulation which is a generalization of Helmholtz decomposition of a vector field. Related forms of the decomposition were developed by Bykhovskiy and Smirnov in 1983, and Wu and Thompson in 1973. Though it has not been generally recognized as such, these formulations resolve the over-specification issues associated with determining a velocity field from velocity boundary conditions and a vorticity field. The generalized decomposition has not been widely used, however, apparently due to a general lack of a useful physical interpretation. An analysis is presented which shows that the generalized decomposition has a relatively simple physical interpretation which facilitates its numerical implementation. The implementation of the generalized decomposition for the normal and tangential velocity boundary conditions is discussed in detail. As an example of the use of this boundary condition, the flow in a lid-driven cavity is simulated. The solution technique is based on a Lagrangian transport algorithm in the hydrocode ALEGRE. ALEGRE's Lagrangian transport algorithm has been modified to solve the vorticity transport equation, thus providing a new, accurate method to simulate incompressible flows. This numerical implementation and the new boundary condition formulation allow vorticity-based formulations to be used in a wider range of engineering problems.

16293 (SAND–95-0278C) **Viscous diffusion of vorticity in unsteady wall layers using the diffusion velocity concept.** Strickland, J.H.; Kempka, S.N.; Wolfe, W.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950283–2: Application of vortex methods to engineering problems forum, Albuquerque, NM (United States), 22-24 Feb 1995). Order Number DE95008537. Source: OSTI; NTIS; GPO Dep.

The primary purpose of this paper is to provide a careful evaluation of the diffusion velocity concept with regard to its ability to predict the diffusion of vorticity near a moving wall. A computer code BDIF has been written which simulates the evolution of the vorticity field near a wall of infinite length which is moving in an arbitrary fashion. The simulations generated by this code are found to give excellent results when compared to several exact solutions. We also outline a two-dimensional unsteady viscous boundary layer model which utilizes the diffusion velocity concept and is compatible with vortex methods. A primary goal of this boundary layer model is to minimize the number of vortices generated on the surface at each time step while achieving good resolution of the vorticity field near the wall. Preliminary results have been obtained for simulating a simple two-dimensional laminar boundary layer.

16294 (UCRL-LR–114962) **Large-eddy simulation of turbulent flow using the finite element method.** McCallen, R.C. Lawrence Livermore National Lab., CA (United States). 15 Feb 1995. 346p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009464. Source: OSTI; NTIS; GPO Dep.

The equations of motion describing turbulent flows (in both the low and high Reynolds-number regimes) are well established. However, present day computers cannot meet the enormous computational requirement for numerically solving the governing equations for common engineering flows in the high Reynolds number turbulent regime. The characteristics that make turbulent, high Reynolds number flows difficult to simulate is the extreme range of time and space scales of motion. Most current engineering calculations are performed using semi-empirical equations, developed in terms of the flow mean (average) properties. These turbulence' models' (semi-empirical/analytical approximations) do not explicitly account for the eddy structures and thus, the temporal and spatial flow fluctuations are not resolved. In these averaging approaches, it is necessary to approximate all the turbulent structures using semi-empirical relations, and as a result, the turbulence models must be tailored for specific flow conditions and geometries with parameters obtained (usually) from physical experiments. The motivation for this research is the development of a finite element turbulence modeling approach which will ultimately be used to predict the wind flow around buildings. Accurate turbulence models of building flow are needed to predict the dispersion of airborne pollutants. The building flow turbulence models used today are not capable of predicting the three-dimensional separating and reattaching flows without the manipulation of many empirical parameters. These empirical parameters must be set by experimental data and they may vary unpredictably with building geometry, building orientation, and upstream flow conditions.

16295 (CONF-941144–106) **Cracking during nanoindentation and its use in the measurement of fracture toughness.** Harding, D.S. (Rice Univ., Houston, TX (United States). Dept. of Materials Science); Pharr, G.M.; Oliver, W.C. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States);Texas Advanced Research Program, TX (United States). DOE Contract AC05-84OR21400. Grant 003652-123. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008839. Source: OSTI; NTIS; GPO Dep.

Results of an investigation aimed at developing a technique by which the fracture toughness of a thin film or small volume can be determined in nanoindentation experiments are reported. The method is based on the radial cracking which occurs when brittle materials are deformed by a sharp indenter such as a Vickers or Berkovich diamond. In microindentation experiments, the lengths of radial cracks have been found to correlate reasonably well with fracture toughness, and a simple semi-empirical method has been developed to compute the toughness from the crack lengths. However, a problem is encountered in extending this method into the nanoindentation regime with the standard Berkovich indenter in that there are well defined loads, called cracking thresholds, below which indentation cracking does not occur in most brittle materials. We have recently found that the problems imposed by the cracking threshold can be largely overcome by using an indenter with the geometry of the corner of a cube. For the cube-corner indenter, cracking thresholds in most brittle materials are as small as 1 mN (~0.1 grams). In addition, the simple, well-developed relation between toughness and crack length used for the Vickers indenter in the microindentation regime can be used for the cube-corner indenter in the nanoindentation regime provided a different empirical constant is used.

16296 (PNL-SA–24388) **Hanford Permanent Isolation Barrier Program: Asphalt technology development.** Freeman, H.D.; Romine, R.A. Pacific Northwest Lab., Richland, WA (United

States). Nov 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–21: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007816. Source: OSTI; NTIS; INIS; GPO Dep.

An important component of the Hanford Permanent Isolation Barrier is the use of a two-layer composite asphalt system, which provides backup water diversion capabilities if the primary capillary barrier fails to meet infiltration goals. Because of asphalt's potential to perform to specification over the 1000-year design life criterion, a composite asphalt barrier (HMAC/fluid-applied polymer-modified asphalt) is being considered as an alternative to the bentonite clay/high density poly(ethylene) barriers for the low-permeability component of the Hanford Permanent Isolation Barrier. The feasibility of using asphalt as a long-term barrier is currently being studied. Information that must be known is the ability of asphalt to retain desirable physical properties over a period of 1000 years. This paper presents the approach for performing accelerated aging tests and evaluating the performance of samples under accelerated conditions. The results of these tests will be compared with asphalt artifact analogs and the results of modeling the degradation of the selected asphalt composite to make life-cycle predictions.

16297 (UCRL-ID–119958) **Rationale and summary of methods for determining ultrasonic properties of materials at Lawrence Livermore National Laboratory.** Brown, A.E. Lawrence Livermore National Lab., CA (United States). 9 Feb 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009475. Source: OSTI; NTIS; GPO Dep.

This report is a summary of the methods used to determine ultrasonic velocities through the many materials tested at the Acoustic Properties of Materials Laboratory. Ultrasonic velocity techniques enable the determination of material properties, including elastic moduli, without harming the materials being tested, an advantage some over mechanical methods. Ultrasonic modulus determination has other advantages as well: (1) relative ease and low cost of material preparation; and (2) comparative analysis to physical testing as a function of material loading rate dependence. In addition, ultrasonic measurement provides clues to determine grain size and orientation, and provides a relative indication of material anisotropy with respect to the material geometry. The authors usually perform ultrasonic measurements on materials in ambient atmospheric conditions, and in a relatively free-free condition. However, the authors can perform them in other environments, as required. This paper describes some of the techniques used in this laboratory and shows how ultrasonic velocities are used to establish elastic constants. It also includes a sample test report for a homogeneous isotropic solid, along with a list of references.

16298 (UCRL-JC–118767) **Design considerations for NDE systems in a factory setting and the application to transmission manufacture at the Chrysler Transmission Plant in Kokomo, Indiana.** LaChapell, M. (Lawrence Livermore National Lab., CA (United States)); Perkins, D.E.; Schneberk, D.J.; Erb, S.H.; Nicholson, R.E. Lawrence Livermore National Lab., CA (United States). Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410331–1: ISATA international conference on new and alternative materials for the transportation industries, Aachen (Germany), 31 Oct - 4 nov 1994). Order Number DE95009568. Source: OSTI; NTIS; GPO Dep.

Chrysler Corp. and LLNL have entered into a collaboration to enhance the NDE technology at the Kokomo transmission plant. The project spans 3 years and a wide variety of different projects. Goals are making NDE automated, reliable, and capable of avoiding destructive testing. This requires NDE systems to be better utilized by quality teams on the shop floor and better connected for providing in one place a sufficient set of data for identifying problems in a manufacturing operation, and prescribing an adjustment. The approach is illustrated on two different processes, laser welding and pressure die casting; in each case data are combined from different NDE systems to enable a decision on an adjustment in process variables.

16299 (DOE/METC/C–95/7176) **METC Combustion Research Facility.** Halow, J.S.; Maloney, D.J.; Richards, G.A. USDOE Morgantown Energy Technology Center, WV (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). (CONF-9411207–1: Advanced turbine systems annual program review, Arlington, VA (United States), 9-11 Nov 1994). Order Number DE95008774. Source: OSTI; NTIS; GPO Dep.

The objective of the Morgantown Energy Technology Center (METC) high pressure combustion facility is to provide a mid-scale facility for combustion and cleanup research to support DOE's advanced gas turbine, pressurized, fluidized-bed combustion, and hot gas cleanup programs. The facility is intended to fill a gap between lab scale facilities typical of universities and large scale combustion/turbine test facilities typical of turbine manufacturers. The facility is now available to industry and university partners through cooperative programs with METC. Currently two combustion rigs are operating and one additional project is under construction for the facility. Space is available in the test cells for at least one additional test rig. A pressurized pulsed combustor began operating in July of 1993. The combustor will carry out pulsed combustion of natural gas at pressures up to 10 atmospheres. A high pressure steady flow rig is currently completely fabricated. The objective of this rig is to test novel, steady-flow, pressurized combustors that produce very low NO_x and other emissions. An evaporation rig currently is in startup. This rig will test the concept of water injection in an externally fired cycle. The specific technical issue that the unit will address is evaporation rates of water droplets in high pressure flows.

16300 (DOE/METC/C–95/7179) **Combustion oscillation control by cyclic fuel injection.** Richards, G.A. (USDOE Morgantown Energy Technology Center, WV (United States)); Yip, M.J.; Robey, E.; Cowell, L.; Rawlins, D. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). (CONF-950629–3: ASME international gas turbine and aeroengine congress and exposition: land, sea and air, Houston, TX (United States), 5-8 Jun 1995). Order Number DE95009548. Source: OSTI; NTIS; GPO Dep.

A number of recent articles have demonstrated the use of active control to mitigate the effects of combustion instability in afterburner and dump combustor applications. In these applications, cyclic injection of small quantities of control fuel has been proposed to counteract the periodic heat release that contributes to undesired pressure oscillations. This same technique may also be useful to mitigate oscillations in gas turbine combustors, especially in test rig combustors characterized by acoustic modes that do not exist in the final engine configuration. To address this issue, the present paper reports on active control of a subscale, atmospheric pressure nozzle/combustor arrangement. The fuel is natural gas. Cyclic injection of 14% control fuel in a premix fuel nozzle is shown to reduce oscillating pressure amplitude by a factor of 0.30 (i.e., ~10 dB) at 300 Hz. Measurement of the oscillating heat release is also reported.

16301 (DOE/PC/90094–T5) **Three-dimensional turbulent particle dispersion submodel development. Final report, 15 April 1991–15 April 1993.** Smith, P.J. Utah Univ., Salt Lake City, UT (United States). Dept. of Chemical Engineering. [1993]. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90094. Order Number DE95009663. Source: OSTI; NTIS; GPO Dep.

Many practical combustion processes which use solid particles, liquid droplets, or slurries as fuels introduce these fuels into turbulent environments. Examples include spray combustion, pulverized coal and coal slurry combustion, fluidized beds, sorbent injection, and hazardous waste incineration. The interactions of the condensed phases with turbulent environments in such applications have not been well described. Such a description is complicated by the difficulty of describing turbulence in general, even in the absence of particles or droplets. But the complications in describing the dispersion and reaction of the condensed phases in turbulent

environments do not stem entirely, or even primarily, from the uncertainties in the description of the turbulence. Even when the turbulence characteristics are known, computational methods for coupling the dynamics of the particulate phase with the continuous phase have not been well established. Several new theoretical descriptions of the turbulent dispersion of particles and droplets have been proposed over the past few years. It has been the purpose of this project to explore the potential of these theories for coupling with the other aspects of three-dimensional, reacting, turbulent, particle-laden systems, to provide computational simulations that could be useful for addressing industrial problems. Two different approaches were explored in this project. The major thrust of this project was on identifying a suitable dispersion submodel for dilute dispersed flows, implementing it in a comprehensive three-dimensional CFD code framework for combustion simulation and evaluating its performance rigorously. In another effort the potential of a dispersion submodel for densely loaded systems was analyzed. This report discusses the main issues that were resolved as part of this project.

16302 (NEI-DK–1961) **Pulsation phenomena and acoustic impedance conditions in larger gas-fueled boilers. Partial project I.** Energiministeriets Forskningsudvalg for produktion og fordeling af el og varme. Braendsler og forbraendingsteknik. Rasmussen, N.B.K. Dansk Gasteknisk Center A/S, Hoersholm (Denmark). Jan 1995. 112p. (In Danish). Contract ENS-1323/91-0002. Order Number DE95772386. Source: OSTI; NTIS.

EFP-91.

Conversion of a number of large boilers in central heating plants from oil fuels to natural gas can cause some problems with noise in the low frequency region. The so-called pulsation noise is due to acoustic oscillations of the burner, furnace and exhaust system, predominantly in the 0 - 100 Hz range. In some cases the narrow-band pulsation noise is so strong that the boiler has to be stopped. This partial project concerns an analysis of these pulsation phenomena in boilers. An exciter system for impedance measurements in the burner system is under construction. Measurement of impedance conditions of boilers and burners and calculation of the characteristic acoustic values for burner systems are the next step of this project. The method is tested on a boiler with confirmed noise problems and in boilers where the pulsation noise is provoked. Ability of the method to predict noise problems is being tested. (EG)

16303 (SAND–95-0681C) **Geologic site characterization requirements for storage and mining in salt.** Neal, J.T. (Sandia National Labs., Albuquerque, NM (United States)); Magorian, T.R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505202–1: Solution Mining Research Institute spring meeting, New Orleans, LA (United States), 1 May 1995). Order Number DE95009866. Source: OSTI; NTIS; GPO Dep.

Geologic Site Characterization should be a dynamic, continuing process, not an event. Its successes and failures are legion and can make or break an operator. A balanced approach must be sought to provide adequate information for safety of operations, neither slighting nor overdoing the effort. The evolving nature of study methods and geologic knowledge essentially mandates that characterization efforts be reviewed periodically. However, indifference, nonchallance, and even outright disdain describe attitudes witnessed in some circles regarding this subject. Unawareness may also be a factor. Unfortunately, several unanticipated events have led to severe economic consequences for the operators. The hard-learned lessons involving several unanticipated geotechnical occurrences at several Gulf Coast salt domes are discussed. The ultimate benefit of valuing site characterization efforts may be more than just enhanced safety and health–costs not expended in lost facilities and litigation can become profit.

16304 (NEI-DK–1888) **Evolution and kinetics of a modulated wave train by use of the boundary element method.** Skourup, J. (Danish Hydraulich Institute. Internation Research Centre for Computational Hydrodynamics, Hoersholm (Denmark)). Dansk Hydraulisk Inst., Hoersholm (Denmark). 1994. 10p. Contract ENS-1313/92-0007. (CONF-9408230–1: International symposium on waves - physical and numerical modelling, Vancouver (Canada), 21-24 Aug 1994). Order Number DE95766500. Source: OSTI; NTIS.

EFP-92.

A numerical method, based on a boundary integral equation combined with a non-linear time stepping procedure for the free water surface, is used for simulations of the evolution in time of a modulated wave train. The governing integral equation is based on Green's 2nd identity and the computations are performed in the physical domain. The kinematics in the fluid domain is determined and compared to the Stokes 5th order wave theory. The comparison is performed on the basis of the steepest wave that appears during the simulation. The results of two simulations are presented. In the first simulation the initial wave train evolves into one massive wave that breaks, whereas the second simulation evolves into a steep non-breaking wave, and thereafter a recurrence against the initial wave train takes place. (au)

16305 (NEI-DK–1889) **Note on sensitivity analysis for extreme crest heights.** Dansk Hydraulisk Inst., Hoersholm (Denmark). 1994. 6p. Contract ENS-1313/92-0007. Order Number DE95766503. Source: OSTI; NTIS.

EFP-92.

The measurements on waves in the Gorm oil field in the North Sea have been analysed in order to derive the 50-year extreme crest height based on the distribution of storms and the empirical distribution of the maximum crest height determined on the basis of 58 storms on record. Additional analyses have been made to determine extreme crests for longer recurrence periods and to assess the sensitivity of the 50-year value to variations in input data. (AB)

16306 (NEI-DK–1890) **Extreme waves in design.** Ottesen Hansen, N.E. Dansk Hydraulisk Inst., Hoersholm (Denmark); Lic Engineering A/S, Hellerup (Denmark). Dec 1994. 24p. Contract ENS-1313/92-0007. Order Number DE95766502. Source: OSTI; NTIS.

EFP-92.

This note comprises the conclusions of phase 5 of the research project: Extreme Waves (EFP'92, 1313/92-0007). The objectives of this phase are: to summarize the results reached in the research; to define procedures for applying extreme waves in the design of platforms; to define methods for determination of the frequency of occurence of extreme waves of the heights, the periods and the form of the crest. (au) (10 refs.)

16307 (NEI-DK–1891) **Wave group statistics for wave series containing extreme waves.** Lorenz, R.Z. Dansk Hydraulisk Inst., Hoersholm (Denmark); Lic Engineering A/S, Hellerup (Denmark). Oct 1993. 63p. Contract ENS-1313/92-0007. Order Number DE95766501. Source: OSTI; NTIS.

EFP-92.

The results of wave group statistics covering wave series with the 13 most important freak waves. The analysis includes zero-up - and zero-down crossing analysis of the wave series. Statistics for wave groups, based on several threshold wave heights, are determined. A comparison with Kimura's model for wave groups is given. The wave group analysis aims to find the distribution of wave groups and time interval between them to examine the wave groups for long period phenomenon and to examine the series of wave heights in the wave group for possible characteristic trends, especially for wave groups containing freak waves. The time series are plotted in a scale enough to examine individual waves, the current velocities are also plotted. The distribution of Run of high waves and the Total Run length follow, to a reasonable extent, Kimura's model. Wave height correlation between successive waves is high, between 0.29 and 0.53, with an average of 0.46. Wave grouping is pronounced. The surface elevation time series shows that the freak waves are mostly located in wave groups with

4-6 waves which are all higher than the significant wave height. Single freak waves are also seen. No characteristic form of the wave groups including freak waves is observed. The freak wave is seen in the beginning, at the end or in the middle of the group. In general the crest elevation of the freak waves are significantly higher and steeper than that of the neighbouring waves. The velocity censors places in elevation -5.6 m show that the particle velocities of the freak waves are only slightly higher than that of the neighbouring waves. (AB)

16308 (NEI-DK–1892) **Freak wave kinematics. Model test report.** Skourup, J. Dansk Hydraulisk Inst., Hoersholm (Denmark). Sep 1994. 76p. Contract ENS-1313/92-0007. Order Number DE95766504. Source: OSTI; NTIS.

EFP-92.

The aim of this study has been an attempt to reproduce, in the institute's offshore wave basin, freak waves measured at the Gorm Field (North Sea), measure the elevation and horizontal particle velocities and perform basic analyses of these with special emphasis on the wave crest regions. The reproductions are made both as 2D and 3D wave series. Freak waves from the period 1983 - 1985 are dealt with. The model tests were performed in a scale of 1:50. Five wave series including freak waves were selected for comprehensive model tests. The waves kept their general shape when reproduced in the institute's offshore basin, and the significant wave height was only slightly reduced. The extreme wave crest height was reduced by ca. 24% for the 2D, and 31% for the 3D, reproductions. The combined effect of chosen model scale and wave basin capabilities explain these reductions. Only wave components with frequencies (periods) within a limited interval can be reproduced due to physical constraints. The freak waves are found to possess a large amount of energy at very high frequencies above the limits for reproduction in the wave basin. The results from the model tests show that even with reduced crest heights, very high horizontal water particle velocities are present in the upper part of the reproduced freak waves, compared to what is found by using the Stokes fifth order wave theory based on the measured height and period of the freak waves. The high crest elevation does not necessarily appear in the reproduction point of the offshore basin. (au)

Wave data from the Gorm oil field in the Danish sector of the North Sea are analyzed in order to find freak waves. Simple criteria are used to identify freak waves and an assessment of candidates is based on visual inspection of time series plots.(AB)

16310 (NEI-DK–1909) **Extreme crest heights.** Dansk Hydraulisk Inst., Hoersholm (Denmark). Aug 1994. 10p. Contract ENS-1313/92-0007. Order Number DE95766495. Source: OSTI; NTIS.

EFP-92.

Wave crests have been analyzed in order to establish a design value applicable to air gap assessments etc. A description of the data, analyses and results are given. The data derives from sea-state information gathered from the analysis of data measured during the period 1966-93. Radar equipment has recorded waves at a rate of 2 Hz during storm conditions. Crest height has been determined using the water level found as an average over the duration of the storm. This information has proved useful for the determination of extreme waves and crests. For each storm this procedure has yielded the maximum crest height relative to the mean sea level during the storm resulting in a total of 58 crest heights. A considerable degree of uncertainty pertains to the determination of Mean Water Level, which naturally influences the measurement of crest height values relative to it. Results of the statistical analysis of all maximum crest heights is that a wave crest height of 14.6 m above Mean Water Level is exceeded once in 50 years in this area. (AB)

16311 (NEI-NO–500) **Technology as a driving force.** Torvund, T. (Norsk Hydro A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 30p. (CONF-9408229–7: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766576. Source: OSTI; NTIS; INIS.

The competitiveness of the Norwegian Continental shelf has been put firmly on the agenda in Norway since the report from a working group set up by the Ministry of Industry and Energy was released in February this year. If there is to be secured a long future for oil and gas activities, a reduction in the time and costs used in the projects of the order of 40-50%, without jeopardizing the high safety and environmental standards achieved in Norway. The paper addresses how technology can be a driving force in achieving these aims. But technology alone cannot do the job. Progress and changes in several other areas are also necessary, and the new scenario also calls for improved relations between all actors in the North Sea, authorities, oil companies, contractors and labour unions. 15 figs.

16312 (NEI-NO–501) **New approaches to cost reduction on the UK continental shelf.** Curtis, M.I. Norsk Petroleumsforening, Oslo (Norway). 1994. 33p. (CONF-9408229–8: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766577. Source: OSTI; NTIS; INIS.

The conference paper deals with cost reduction on the UK continental shelf. New approaches on the reduction of field development costs are compared with the cases if traditional approaches had been followed. Field developments where success in aligning the goals and objectives of the contractors and owners which led to projects being delivered on time but more than 20% below budget, are exemplified. The contractors in the alliance received 55% of the savings in addition to their normal profit. The procedure to follow in such cases, is discussed.

16313 (NEI-NO–503) **How to create a win-win situation between the oil companies and the contractors/suppliers.** Bergersen, T. (Aker Oil and Gas Technology (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 5p. (CONF-9408229–10: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766579. Source: OSTI; NTIS.

The conference paper deals with the obtained experience in Norway on contract management offshore. The paper discusses the issue of new ideas with the aim of creating a win-win situation and to obtain simplified contracts. Two main areas are discussed. Firstly, how to create a business environment where conflicts are less likely to occur, and secondly, how to handle conflicts efficiently when they occur.

16314 (NEI-NO–520) **Responding to cost efficiency requirements in offshore project.** Nilsen, G. Brustad (ABB Offshore Technology A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 7p. (CONF-9408229–27: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766596. Source: OSTI; NTIS.

The conference paper focuses on the subsea system and the cost effective scheme of the planned Norwegian Vigdis field development encompassing the well system, protective structures, control systems, and umbilicals. In order to achieve the overall goal of cost effective solutions, focus has been put on a concept based upon suppliers standard products and technology, re-use of available tools and equipment, and new models for project execution. Cost reductions have been in the order of 20-50%.

16315 (NEI-NO–521) **Cost efficient solutions for marginal field developments.** Forbes, G.A. (Norske Veritas Industry, VERITEC, Stavanger (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 28p. (CONF-9408229–28: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766597. Source: OSTI; NTIS.

Cost effectiveness as a means to improve development prospects for marginal fields is very topical. This paper focuses on

some methods currently available. Topics discussed are: Historical and cultural aspects; cost influence; contracting strategy; project organization; performance measurement and improvement; responsibility and interfaces; system packaging; functional system specifications and orders; information management. 20 figs.

16316 (NEI-NO–524) **Deep water field development.** Vance, G.P. (Mobil Research and Development Corp. (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 14p. (CONF-9408229–31: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766600. Source: OSTI; NTIS.

The conference paper discusses the cost of field developments in deep water areas. Some of the major international oil companies have estimated that 50% of their future reserves are in water depths greater than 1000 feet. Studies have shown that deep water fields can be economically developed, with capital costs in the order of $2 to $3 per barrel, drilling costs in the order of $2 to $3 per barrel, and operating costs in the order of $2 to $4 per barrel. The cost would increase some 70-80% by going from about 1000 feet to 4000 feet. The paper illustrates and discusses the future demand of new technologies to be developed. 9 figs.

16317 (NEI-NO–525) **FPSO and TLP deepwater station-keeping systems. Problems and solutions.** D'Souza, R.B. (Aker Omega, Inc. (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 19p. (CONF-9408229–32: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766601. Source: OSTI; NTIS.

The conference paper focuses on deepwater station-keeping systems for FPSO's (Floating Production Storage and Offloading Systems) and TLP's (Tension Leg Platforms). It reviews the state-of-practice and highlights design and cost drivers. Key technology issues and challenges related to analysis, design, equipment, materials and installation are addressed. Finally, areas and ideas that hold significant promise for major cost reductions are discussed. 20 refs., 13 figs., 2 tabs.

16318 (NEI-NO–526) **Riser design options.** Fisher, E.A. (Cooper Industries (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 5p. (CONF-9408229–33: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766602. Source: OSTI; NTIS.

The major part of this paper is based on a production riser system used in the Gulf of Mexico. The original philosophy was to design a system for small marginal fields that could drain a reservoir and then be moved on to a second or even a third location. The system was sized to support 24 wells with a peak production of 45.000 barrels of oil and 120.000.000 cubic feet of gas per day. The economics of this system are excellent, especially compared to much larger installations with similar production rates.

16319 (NEI-NO–527) **The flexible riser option.** Narzul, P. (Coflexip Norge A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 11p. (CONF-9408229–34: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766603. Source: OSTI; NTIS.

The conference paper deals with the flexible riser option and challenges in deepwater areas between 1.000 and 2.000 m. Topics are: Challenges of high static top tensions; challenges of high hydrostatic pressures; dynamic aspects and fatigue; installation aspects; floater interface; why flexible risers. 4 refs., 5 figs.

16320 (NEI-NO–528) **Turret moored systems approach.** Baadshaug, O. (Kvaerner Engineering A/S (Norway)); Gulbrandsen, H. Norsk Petroleumsforening, Oslo (Norway). 1994. 24p. (CONF-9408229–35: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766604. Source: OSTI; NTIS.

The development of oil and gas fields in very deep waters will be performed by utilizing floating production units with probably extensive use of subsea developments. Candidate substructures for deepwater developments are TLPs (Tension Leg Platforms), deep draft floaters, semi submersibles, turret moored systems, and possible new concepts. The authors of this paper will focus on turret moored systems (production ships). The system includes production, storage and offloading in one single system, hence all elements except for drilling can be performed from the same unit. Offshore storage and offloading will often be required due to expected lack of infrastructure and pipelines. A special feature is the weather-vaning capability which gives significantly reduced environmental forces compared to other concepts. This feature makes it possible to reduce mooring line weights and consequently the costs. Another factor is to fabricate the substructure (hull) with utility systems at ship yards using the standard ship production line. 10 figs., 1 tab.

16321 (NEI-NO–529) **Floating production: Future requirements.** Kenison, R. (British Petroleum (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 18p. (CONF-9408229–36: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766605. Source: OSTI; NTIS.

The conference paper deals with future requirements of floating production systems. The North Sea area has seen many applications successfully used for many years. Floating production facilities are able to offer effective life of field facility for developing large fields in a range of water depths in direct competition to the traditional structures used to date. The paper addresses the context in which floating production units can be considered, what business influences will deliver improved performances and the possibility of wider applications. Floating production can offer the benefits of fast pace and flexibility of design throughputs which alternative concepts cannot offer. The theme of the paper is flexibility and pace. 9 figs.

16322 (NEI-NO–530) **The role of the floaters. Designing for larger topside facilities.** Eriksson, J.G. (Kvaerner Engineering A/S, Oslo (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 16p. (CONF-9408229–37: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766606. Source: OSTI; NTIS.

The conference paper discusses larger topside facilities offshore. Topics are: Challenges to the industry; key issues; principal applications of floaters; types of floaters, overview; topside functional requirements; topside design objectives; features of floater topsides, design challenges; improvements to the design process; improvements to project execution models; development ideas. 2 tabs.

16323 (NEI-NO–534) **Designing for efficient installation and intervention.** Halvorsen, T. (Kongsberg Offshore (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 9p. (CONF-9408229–41: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766610. Source: OSTI; NTIS.

EPC type contracts have led to an integration of the various systems to lower the cost of the combined equipment package with only limited focus on the installation and intervention cost. As installation and intervention represent a major part of the total well cost, it is a natural step to optimize the total cost for equipment and installation. Successful delivery and installation of Draugen, SSP and Heidrun subsea wells have provided an excellent experience base for designing cost efficient subsea systems, integrating equipment and installation to minimize the total subsea well cost. The paper presents the experience gained from these projects, and how this experience has been used in the development of the next generation subsea systems.

16324 (NEI-NO–535) **A case for standardisation of subsea technology.** Garnham, D. (Cooper Oil Tool, Leeds (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 13p. (CONF-9408229–42: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766611. Source: OSTI; NTIS.

The conference paper deals with the standard-based subsea technology. Typically the developers will have to cater for deep water, high temperature and high pressure. In fact with the increased cost of working in deeper water and more inclement weather,

Capex and Opex cost of subsea trees will be critical in the overall cost analysis which is developed to determine a field's viability. The paper discusses the modular Matrix subsea tree system being developed besides the future requirement of three functional types of trees which include production trees, water injection trees and gas lift trees. 4 figs.

16325 (NEI-NO–536) **Advances in drilling and completion technology.** Garcia, J.A. (Exxon Co. International (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 14p. (CONF-9408229–43: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766612. Source: OSTI; NTIS.

The conference paper deals with notable areas of improvement on advanced drilling and completion technology. Following areas are discussed: Wellbore stability, where the value of high-potassium mud systems and quantified prediction of wellbore failure is recognized; drilling fluids, with the introduction of biodegradable pseudo-oil-base muds and an effective lubricity additive for water-base muds; drilling equipment and operating procedures, including larger drill pipe and more reliable motors and MWD tools; MWD logging, where better tools and more sophisticated analysis are closing the gap with wireline logging; completion technology, including sand control for long horizontal wells. Additional progress is desired in many areas such as water-base muds, prediction of sand production, and disposal of well-test fluids. 14 refs., 2 figs., 1 tab.

16326 (NEI-NO–544) **Applying J-curve techniques for deep water pipelines.** Springmann, S.P. (McDermott Marine Construction (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 10p. (CONF-9408229–51: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766620. Source: OSTI; NTIS.

The conference paper deals with pipelaying techniques in the Vermilion and Eugene Island Areas, Offshore Louisiana. As part of the planned offshore installation of the respective 12 inches oil and gas pipelines connecting the Auger Tension Leg Platform (TLP) to two shallow water platforms, Shell Oil Company required the use of J-Lay pipelaying techniques for the installation of the Phase II deepwater portions of the Auger pipelines ranging from water depths of 1200 to 2860 feet. The paper describes the J-Lay Pipelay System utilized to install the deepwater portions of the Auger 12 inches pipelines and the means by which pre-fabricated pipe joints were assembled, handled, and installed utilizing J-lay methods and techniques. As evidenced by the successful installation of the Auger pipelines, this new technology provides proven, reliable methods in which deepwater pipelaying operations can be performed beyond the limits of conventionally moored S-Lay Reel-Lay pipelaying vessels. 2 refs., 5 figs.

16327 (NEI-NO–545) **Laying the worlds deepest pipeline, lessons learned.** Hotchkiss, B. (Stena Offshore (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 12p. (CONF-9408229–52: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766621. Source: OSTI; NTIS.

The conference paper addresses the success of the comparatively recent development of J-lay with respect to deep water pipelay. In laying the world deepest rigid pipeline in Brazil, there was utilized a tool which was built in 1979 when the flowline industry generally did not exist. The installation vessel, the reel vessel Stene Apache, did require modification to its pipelaying equipment and support services. These modifications were not radical and were part of an ongoing upgrade of capability based on requirement, i.e. market forces, to meet the needs of the day. To address the subject matter, it is perhaps important to refer to the installation programme in Brazil 1992 when the deepest rigid pipeline of the time was installed by Apache, this was a 10 inch pipe at 705 metre depth. When returning to Brazil in 1994 to install 12 inch pipe to a new record depth of 886 metres, certain changes to equipment and procedures were implemented based upon the previous experience. 4 figs.

16328 (NEI-NO–546) **J-lay welding production improvement program.** Hirsch, D.J. (PCI Energy Services, Lake Bluff, IL (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 7p. (CONF-9408229–53: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766622. Source: OSTI; NTIS.

The conference paper deals with the specific requirements of J-lay pipe welding merit detailed study. Special emphasis needs to be placed on the variables controlling welding and inspection productivity to provide economic J-lay pipelay techniques. A program was undertaken to make initial efforts to identify and improve those variables. 4 refs., 2 figs.

16329 (IFVE-OEA–93-145) **Coding systems in the laser photo plotter of raster type.** Bufan, A.M.; Ivanov, A.A.; Ivanov, A.An.; Morozov, A.F.; Nechaev, Yu.C. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 7p. (In Russian). Order Number DE95628813. Source: OSTI; NTIS (US Sales Only); INIS.

The systems of the coding of angular position of the laser beam in the laser photo plotter of raster type are described. The coding along the X-axis is carried out with the reference grid and the laser interferometer is used to detect the mirror angle position along the Y-axis. In addition the coding of coordinates corresponding to the center of the video signal when the laser beam intersects any cross legs on the etalon glass is provided. 2 refs., 3 figs.

16330 **Method for spatially uniform electroplating and apparatus therefor.** Mayer, S.T.; Contolini, R.J. To Dept. of Energy. 1993. Filed date 30 Mar 1993. U.S. Patent Application 8-039,677. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009993. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Pulsed voltage is used in a flow electroplating cell for achieving spatially uniform electrodeposits. The method includes placing the sample in an electrolyte cell having an electrode, flowing an electrolyte on the sample, applying a voltage between the sample and the electrode, and controlling a voltage according to prespecified, multi-level pulsed waveform during the step of flowing an electrolyte on the sample. The electroplating is further enhanced by rotating the sample while flowing the electrolyte on the sample. An electrolyte bath is filled during use to an operating level of electrolyte. An electrolyte flow channel is provided within the bath, providing a flow channel upward from the bottom of the bath toward the operating level. A reference electrode is placed in the electrolyte bath in electrical contact with the electrolyte during use. A porous counter electrode is mounted over the electrolyte flow channel, so that electrolyte from the flow port flows through the electrode into the bath at a level below the operating level. A mount for a sample to be plated is included which mounts the sample over the counter electrode so that the surface of the sample having a feature to be electroplated is below the operating level of the bath and above the counter electrode, completely immersed in the electrolyte.

16331 (PNL–10478) **The potential for microtechnology applications in energy systems: Results of an experts workshop.** Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95009103. Source: OSTI; NTIS; GPO Dep.

Microscale technologies, or microelectromechanical systems (MEMS), are currently under development in the United States and abroad. Examples include microsensors, microactuators (including micromotors), and microscale heat exchangers. Typically, microscale devices have features ranging in size from a few microns to several millimeters, with fabrication methods adapted from those developed for the semiconductor industry. Microtechnologies are already being commercialized; initial markets include the biomedical and transportation industries. Applications are being developed in other industries as well. Researchers at the Pacific Northwest Laboratory (PNL) hypothesize that a significant number of energy

applications are possible. These applications range from environmental sensors that support enhanced control of building (or room) temperature and ventilation to microscale heat pumps and microscale heat engines that could collectively provide for kilowatt quantities of energy conversion. If efficient versions of these devices are developed, they could significantly advance the commercialization of distributed energy conversion systems, thereby reducing the energy losses associated with energy distribution. Based upon the potential for energy savings, the U.S. Department of Energy (DOE) Office of Building Technologies (OBT) has proposed a new initiative in energy systems miniaturization. The program would focus on the development of microtechnologies for the manufactured housing sector and would begin in either FY 1997 or FY 1998, ramping up to $5 million per year investment by FY 2001.

16332 (SAND–94-0252C) **Spotsize measurements of a focused CW Nd:YAG laser.** Essien, M.; Schanwald, L.P.; Fuerschbach, P.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–20: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95007746. Source: OSTI; NTIS; GPO Dep.

The minimum spotsize, beam quality or M^2, and Strehl ratio of a focused laser beam provide different measures of the performance of the laser/optic system. Focusing lenses typically used to provide irradiances sufficient to cause melting and/or vaporization of metals or ceramics typically exhibit considerable spherical aberration, and thus limit the minimum spotsize attainable for a given lens at a specific laser power. The purpose of this work is to quantify the increase in the minimum spotsize and decrease in Strehl ratio of a focused materials processing CW Nd:YAG laser caused by laser cavity heating and spherical aberration introduced by the focusing lens. Minimum spotsize was determined by making several measurements of spotsize along the propagation direction using a scanning aperture system, and fitting the data to the laser propagation equation. These measurements were performed for 6 plano-convex lenses of different focal lengths, using laser powers ranging from 500 to 1500 watts. A nonlinear variation of spotsize with laser power and with focal length was observed for the lenses and power levels tested.

16333 (SAND–94-2169C) **Fractal quantum well heterostructures for broadband light emitters.** Crawford, M.H.; Gourley, P.L.; Meissner, K.E.; Sinclair, M.B.; Jones, E.D.; Chow, W.W.; Schneider, R.P. Jr. Sandia National Labs., Albuquerque, NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–31: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95009579. Source: OSTI; NTIS; GPO Dep.

We examine carrier relaxation and radiative recombination in AlGaAs based near IR and AlGaInP based visible fractal quantum well heterostructures. Through temperature dependent photoluminescence, we demonstrate that enhanced population of higher lying energy levels can be achieved by varying the thickness of the layers in the fractal heterostructurd. This distribution of carriers results in room temperature emission over a relatively broad range of wavelengths: approximately 700–855 nm for AlGaAs structures and 575–650 nm for AlGaInP structures. Spectra are compared to theoretical calculations to evaluate the non-equilibrium nature of the carrier distributions. Time resolved photoluminescence measurements demonstrate an approximately linear relationship between the radiative decay time and the layer thickness of the structure. Correspondingly, integrated luminescence measurements at room temperature reveal a factor of four increase in the light output efficiency of the structure as the fractal layer thickness is increased from 50 Å to 400 Å. The applicability of these heterostructures to broadband LEDs is discussed.

16334 (SAND–94-2619C) **Defect centers in chemical-mechanical polished MOS oxides.** Shaneyfelt, M.R.; Warren, W.L.; Hetherington, D.L.; Timon, R.P.; Resnick, P.J.; Winokur, P.S. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506105–1: INFOS '95: insulating films on semiconductors conference, Grenoble (France), 7-10 Jun 1995). Order Number DE95004777. Source: OSTI; NTIS; INIS; GPO Dep.

Defect centers generated in vacuum-ultraviolet irradiated chemical-mechanical polished oxides have been characterized using electron paramagnetic resonance and C-V analysis. Both oxide trap E_γ and interface trap P_{b0} centers were detected in unpolished and polished oxides. In addition, another interface defect center known as the P_{b1} center was only identified in the polished oxides, suggesting that the polishing process altered the SiO_2/Si interface.

16335 (SAND–95-0573C) **Intermetallic compound layer growth kinetics in non-lead bearing solders.** Vianco, P.T.; Kilgo, A.C.; Grant, R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503119–2: ECM '95 conference, Las Cruces, NM (United States), 12-15 Mar 1995). Order Number DE95009595. Source: OSTI; NTIS; GPO Dep.

The introduction of alternative, non-lead bearing solders into electronic assemblies requires a thorough investigation of product manufacturability and reliability. Both of these attributes can be impacted by the excessive growth of intermetallic compound (IMC) layers at the solder/substrate interface. An extensive study has documented the stoichiometry and solid state growth kinetics of IMC layers formed between copper and the lead-free solders: 96.5Sn-3.5Ag (wt.%), 95Sn-5Sb, 100Sn, and 58Bi-42Sn. Aging temperatures were 70–205 C for the Sn-based solders and 55–120 C for the Bi-rich solder. Time periods were 1–400 days for all of the alloys. The Sn/Cu, Sn-Ag/Cu, and Sn-Sb/Cu IMC layers exhibited sub-layers of Cu_6Sn_5 and Cu_3Sn; the latter composition was present only following prolonged aging times or higher temperatures. The total layer growth exhibited a time exponent of $n = 0.5$ at low temperatures and a value of $n = 0.42$ at higher temperatures in each of the solder/Cu systems. Similar growth kinetics were observed with the low temperature 58Bi-42Sn solder; however, a considerably more complex sub-layer structure was observed. The kinetic data will be discussed with respect to predicting IMC layer growth based upon solder composition.

16336 (UCRL-JC–118408) **Femtosecond, Cr^{4+}:YAG laser.** Nathel, H. (Lawrence Livermore National Lab., CA (United States)); Sennaroglu, A.; Pollock, C.R. Lawrence Livermore National Lab., CA (United States). Aug 1994. 2p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Joint Services Electronics Program (United States);Cornell Univ., Ithaca, NY (United States). DOE Contract W-7405-ENG-48. Grant ECS-9111838. (CONF-9405308–1: 9. ultra short phenomenon, Heidelberg (Germany), 2-5 May 1994). Order Number DE95004964. Source: OSTI; NTIS; GPO Dep.

Results from both a regeneratively-initiated and self-initiated, mode-locked CR.YAG laser which is tunable from 1.51 to 1.53 μm are reported. One hundred and twenty femtosecond, nearly transform-limited pulses have been generated with peak output powers of 45 kW. The stable, high peak power pulses and room temperature operation of this laser make it a very suitable alternative to the cumbersome, cryogenic mode-locked NaCl laser commonly used in both narrow bandgap semiconductor and optical communications research.

16337 (BNL–61149, pp. 12-19) **RF linacs for radioisotope production.** Hamm, R.W. (AccSys Technology, Inc., Pleasanton,

CA (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

This paper is an update on the development of the rf linacs for radioisotope production first described in the accelerator roundtable presentations at the Third Targetry Workshop in Vancouver, Canada. These compact ion accelerators, now possible because of the development of the Radio Frequency Quadrupole (RFQ), can provide high currents of protons, deuterons, or helium ions from energies of a few MeV up to 100 MeV. Several of the rf linacs described in Vancouver have now been designed and developed for PET radionuclide production, showing their obvious advantages over other accelerator technology in size, weight and shielding requirements. Based on the results from these prototype systems, a design has now been completed for a 7 MeV proton linac that, when coupled to the new targets being developed, can supply all four PET radionuclides (^{11}C, ^{13}N, ^{15}O, and ^{18}F) in adequate quantities for clinical studies. This accelerator will require little or no shielding when the proton beam is delivered to a compact shielded target assembly, making it capable of being placed virtually anywhere in a hospital or clinic.

16338 (BNL–61149, pp. 20-29) **^{3}He RFQ for PET isotope production: A UW/SAIC progress report.** Krohn, K.A. (Univ. of Washington, Seattle, WA (United States)); Link, J.M.; Weitkamp, W.G.; Hagan, W.K.; Young, P. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A broad agency announcement by the Strategic Defense Initiative of the US Department of Defense ("Star Wars") in 1988 requested proposals to apply new accelerator technology being developed for the military for alternative uses in medical research. The proposals were to be evaluated on issues such as cost, weight, simplicity, control systems, and targetry. This report describes one such project proposed jointly by Science Applications International Corporation (accelerator design and development), the University of Washington (targetry development) and Scanditronix (manufacturing). SDIO funding for miniaturized accelerators for PET was awarded in November 1989. Two different projects were funded: Science Research Laboratories and Washington University (St. Louis) to develop the tandem cascade accelerator and this group to develop the 8 MeV ^{3}He RFQ.

16339 (BNL–61149, pp. 30-32) **An ultra-compact ^{13}N-ammonia generator.** Klinkowstein, R.E. (Science Research Lab., Inc., Somerville, MA (United States)); Shefer, R.E.; Hughey, B.J.; Welch, M.J.; Mallinckrodt. Brookhaven National Lab., Upton, NY (United States). 1994. Grant 1R43HL48969; Grant 2R44CA53953; Contract SDI084-89-C-0049. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A dedicated, accelerator-based ^{13}N-ammonia generator capable of providing multiple 30 mCi batches of $^{13}NH_3$ for clinical use is under development at Science Research Laboratory, Inc. (SRL). The system utilizes a very low energy (1.2 MeV) coaxial cascade accelerator (CCA) to produce ^{13}N-ammonia via the $^{12}C(d,n)^{13}N$ nuclear reaction in a solid graphite target. The ^{13}N production target designed for this system is windowless and allows in-situ extraction of activity via combustion of the graphite, as described in an accompanying paper. The authors have tested a prototype target using an existing deuteron accelerator at SRL and have shown that the target is reusable for multiple irradiation and extraction cycles. New target processing techniques developed at SRL and Washington University allow the extraction and conversion of target activity to ^{13}N-ammonia in under 10 minutes with a total decay-corrected efficiency of 44%. Using these techniques, a batch yield of 30 mCi of $^{13}NH_3$ may be obtained from an EOB target yield of 136 mCi of ^{13}N-ammonia. The authors have measured the thick target yield from the $^{12}C(d,n)^{13}N$ reaction on graphite at low deuteron bombarding energies and have found that the saturated yield at 1.2 MeV is 0.85 mCi/μA. A deuteron beam current of approximately 215 μA will therefore provide the required target yield in a 20 minute irradiation time.

16340 (BNL–61149, pp. 33-37) **Progress report on the TR13.** Ruth, T.J.; Buckley, K. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The TR13 is a 13 Me cyclotron is a developed jointly by TRIUMF and Ebco Technologies of Richmond, BC under a technology transfer agreement. The cyclotron is designed as an integrated facility consisting of a cyclotron, target changer, targets, local shielding and product transfer systems. The design reflects more than eight years experience with the CP42 cyclotron facility, two years with the TR30 (another joint effort between TRIUMPH and Ebco) and state-of-the-art cyclotron technology. The main features that are responsible for high productivity and low radiation exposure are: the cyclotron has an external ion source capable of producing a much higher beam current than an internal source. The high gas flow, required to run the source, does not adversely affect vacuum in the cyclotron due to differential pumping between source and cyclotron. Therefore activation of the machine due to gas stripping is very low. Low beam energy to minimize reaction pathways causing parts activation. Localized modular shielding around most radioactive components. Because of the low energy and minimal beam loss the cyclotron and targets do not need a separate shielded vault when outfitted with the localized shielding.

16341 (BNL–61149, pp. 38-43) **Superconducting cyclotron for clinical PET.** Tanaka, Masahiro (NKK Corp., Tokyo (Japan)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

As PET has become more popular, there have been growing needs for an easily operational cyclotron and chemistry system. Not many hospitals want to keep a full set of operators: a cyclotron operator, a chemistry module operator and a scanner operator. When producing ammonia or fluoro deoxy glucose (FDG) for example, a cyclotron should be operated by a chemistry module operator. When performing an [^{15}O] gas study, it should be operated by a scanner operator or even by a doctor. Therefore the bases for developing the cyclotron, the targets and the chemistry modules have been: (1) Simple operation; (2) High reliability; and (3) Easy maintenance. The authors have installed the cyclotron and chemistry systems at Hyogo Institute for Aging Brain and Cognitive Disorder and Osaka City University. This paper introduces the outline of the system with a detail of [^{13}N] ammonia production.

16342 (BNL–61149, pp. 364) **The BLIP Upgrade Project.** Mausner, L.F. (Brookhaven National Lab., Upton, NY (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

This $6M BLIP construction project, funded by the DOE Office of Energy Research for a Fiscal Year 1994 start, is anticipated to be complete in June 1996. The purpose of the BLIP Upgrade Project is to reverse the erosion in radionuclide production capability and availability that has occurred at BNL to enable BLIP to serve as a reliable source of selected radionuclides in the interim until the NBTF comes on line. The project goals are to increase the proton beam current from 50 μA to 145 μA, improve BLIP/LINAC reliability, and enhance processing facilities to handle the higher levels of radioactivity expected. Finally, to improve radionuclide supply the authors propose to run the facility up to 46 weeks per year with

90% beam availability (1.5d/month maintenance = 5% + 5% downtime). At this point there is no commitment from either the Office of Energy Research or the Office of Nuclear Energy to provide the necessary operating funds. The specific facility modifications are summarized.

16343 (CONF-9410294–4) **Status report on the Holifield Radioactive Ion Beam Project.** Meigs, M.J. (and others); Alton, G.D.; Auble, R.L. Oak Ridge National Lab., TN (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 symposium of the North Eastern Accelerator personnel (SNEAP-94); Kalamazoo, MI (United States); 12-15 Oct 1994. Order Number DE95009128. Source: OSTI; NTIS; INIS; GPO Dep.

In July 1992, a project was started to reconfigure the Holifield Heavy Ion Research Facility (HHIRF) to form the Holifield Radioactive Ion Beam Facility (HRIBF). This ORNL project to produce medium-intensity, proton-rich, radioactive ion beams (RIBS) for astrophysics, nuclear physics, and applied research was first described to the SNEAP community at Chalk River in 1992. To briefly review, radioactive ions will be produced by light ion beams from the Oak Ridge Isochronous Cyclotron (ORIC) striking a target in an Isotope Separator On-Line (ISOL)-type target-ion source assembly. The radioactive ions will be converted to negative ions either directly in the ion source or by charge exchange following positive ionization. After acceleration to approximately 300 keV, these ions will be injected into the tandem accelerator for acceleration to higher energies. Successful production and acceleration of RIBs requires changes in the existing accelerators, development of the target-ion source, and construction of a new high-voltage injector and new injection beam line for the tandem accelerator. A floor plan of the facility as it should be when the project is finished is given. Progress has been made in a areas and will be detailed starting with the cyclotron.

16344 (ENEA-RT-INN–94-20) **Preliminary design of technologically advanced and compact synchrotron for proton therapy.** Picardi, L. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Ronsivalle, C.; Vignati, A.; Silvestrov, G.; Vsevolozskhaya, T.; Bartolini, R. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Nov 1994. 64p. (RT/INN–94-20). Order Number DE95771055. Source: OSTI; NTIS (US Sales Only).

This paper describes the activity on optimising the parameters of a compact protosynchrotron in the energy range of 80-200 MeV. Based on the 200-MeV protosynchrotron under development at the Budker Institute for Nuclear Physics at Novosibirsk, the work was stimulated by the Italian 'Progetto Adroterapia' whose aim is to diffuse cancer therapy with protons and ions. The innovative aspect of the project is the use of 4-Tesla warm pulsed dipole magnets that allow an accelerator diameter of the order of 2 meters, thus permitting the machine to be transported pre-assembled.

16345 (FNAL-TM–1901) **Modelling the Fermilab Collider to determine optimal running.** McCrory, E. Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95005756. Source: OSTI; NTIS; INIS; GPO Dep.

A Monte Carlo-type model of the Fermilab Collider has been constructed, the goal of which is to accurately represent the operation of the Collider, incorporating the aspects of the facility which affect operations in order to determine how to run optimally. In particular, downtime for the various parts of the complex are parameterized and included. Also, transfer efficiencies, emittance growths, changes in the luminosity lifetime and other effects are included and randomized in a reasonable manner. This Memo is an outgrowth of TM-1878, which presented an entirely analytical model of the Collider. It produced a framework for developing intuition on the way in which the major components of the collider affect the luminosity, like the stacking rate and the shot set-up time, for example. However, without accurately including downtime effects, it is not possible to say with certainty that the analytical approach can produce accurate guidelines for optimizing the performance of the Collider. This is the goal of this analysis. We first discuss the way the model is written, describing the object-oriented approach taken in C++. The parameters of the simulation are described. Then the potential criteria for ending stores are described and analyzed. Next, a typical store and a typical week are derived. Then, a final conclusion on the best end-of-store criterion is made. Finally, ideas for future analysis are presented.

(CONF-9308262–: 11. conference of Czech and Slovak physicists, Zilina (Slovakia), 30 Aug - 3 sep 1993). In *Proceedings of the 11. conference of Czech and Slovak physicists.* Order Number DE95626244. Source: OSTI; NTIS (US Sales Only); INIS.

A description is given of the reconstructed linear electrostatic accelerator and the possibilities outlined of its use and future improvements. Optical properties of the accelerator tube were optimized; a special non-homogeneous potential contribution was found which allows the application of high voltage within the range of 50 to 900 kV. 900 kV was found to be the optimum voltage for the accelerator performance. A brief description of the accelerator and its performance is given. (Z.S.) 2 figs., 9 refs.

16347 (INP–1672/AP) **AIC-144 S isochronous cyclotron conversion for medicine and other applications (60 MeV p).** Schwabe, J. (Institute of Nuclear Physics, Cracow (Poland)); Balmas, A.; Godunowa, H. Institute of Nuclear Physics, Cracow (Poland). Apr 1994. 12p. Order Number DE95628722. Source: OSTI; NTIS; INIS.

Modification of AIC-144 S isochronous cyclotron were aimed et increasing the maximum energy of protons up to 60 MeV, and minimizing excitation power losses of resonator cavity. They have been attained by increasing the value of average magnetic field up to 18.2 kGs on the extraction radium (62.5 cm) and by extending to the upper band of RF generator frequency from 24.8 MHz to 26.1 MHz and obtaining the conditions for the cavity tuning in this frequency. These modifications were cheap and single. (author). 2 refs, 7 figs, 3 tabs.

16353 (LA-UR–95-631) **APT cost scaling: Preliminary indications from a Parametric Costing Model (PCM).** Krakowski, R.A. Los Alamos National Lab., NM (United States). 3 Feb 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007859. Source: OSTI; NTIS; INIS; GPO Dep.

A Parametric Costing Model has been created and evaluate as a first step in quantitatively understanding important design options for the Accelerator Production of Tritium (APT) concept. This model couples key economic and technical elements of APT in a two-parameter search of beam energy and beam power that minimizes costs within a range of operating constraints. The costing and engineering depth of the Parametric Costing Model is minimal at the present "entry level", and is intended only to demonstrate a potential for a more-detailed, cost-based integrating design tool. After describing the present basis of the Parametric Costing Model and giving an example of a single parametric scaling run derived therefrom, the impacts of choices related to resistive versus superconducting accelerator structures and cost of electricity versus plant availability ("load curve") are reported. Areas of further development and application are suggested.

16355 (BNL–61552) **The linear parameters and the decoupling matrix for linearly coupled motion in 6 dimensional phase space. Informal report.** Parzen, G. Brookhaven National Lab., Upton, NY (United States). Mar 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (AD/RHIC–132). Order Number DE95009042. Source: OSTI; NTIS; INIS; GPO Dep.

It will be shown that starting from a coordinate system where the 6 phase space coordinates are linearly coupled, one can go to a new coordinate system, where the motion is uncoupled, by means of a linear transformation. The original coupled coordinates and the new uncoupled coordinates are related by a 6 x 6 matrix, R. R will be called the decoupling matrix. It will be shown that of the 36 elements of the 6 x 6 decoupling matrix R, only 12 elements are independent. This may be contrasted with the results for motion in 4-dimensional phase space, where R has 4 independent elements. A set of equations is given from which the 12 elements of R can be computed from the one period transfer matrix. This set of equations also allows the linear parameters, β_i, α_i = 1, 3, for the uncoupled coordinates, to be computed from the one period transfer matrix. An alternative procedure for computing the linear parameters, the β_i, α_i i = 1, 3, and the 12 independent elements of the decoupling matrix R is also given which depends on computing the eigenvectors of the one period transfer matrix. These results can be used in a tracking program, where the one period transfer matrix can be computed by multiplying the transfer matrices of all the elements in a period, to compute the linear parameters α_i and β_i, i = 1, 3, and the elements of the decoupling matrix R. The procedure presented here for studying coupled motion in 6-dimensional phase space can also be applied to coupled motion in 4-dimensional phase space, where it may be a useful alternative procedure to the procedure presented by Edwards and Teng. In particular, it gives a simpler programming procedure for computing the beta functions and the emittances for coupled motion in 4-dimensional phase space.

16356 (JINR–9-92-231) **Electron beams from the phasotron in a low-background laboratory.** Dem'yanov, A.V.; Drebushko, A.E.; Mamedov, T.N.; Roganov, V.S.; Tsupko-Sitnikov, V.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. 15p. (In Russian). Order Number DE95626778. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes electron (positron) beams obtained in a low-background laboratory by means of beamline 2 from the JINR phasotron. The beams were shaped in the momentum range from 30 to 350 MeV/c with the spread of +-5% and intensity 10^5-10^6 particles per second per 1 μA of the extracted proton beam. The information an admixtures of other particles depending on the momentum are given. 7 refs.; 9 figs.; 1 tab.

Submitted to At Energ.

Interaction of 1 GeV proton beam with the various Thorium targets is simulated by the Monte Carlo method. It is shown that un the big (practilally infinite) metal thorium slab the neutron yield is one third less than is similar ^{238}U slab. The influence of lead core introduced for the more efficient heat transfer is invesigated. The dependence of the breeding characteristics on the homogeneous enrichment of thorium target by ^{233}U isotope is considered. The neutron multiplication and the heat yield are calculated in the system with sodium coolant similar to the blanket zone of the fast neutron reactor. The influence of homogeneous enrichment of Thorium by ^{233}U isotope is discussed. 6 refs.; 15 figs.; 2 tabs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 10p. (In Russian). Order Number DE95627937. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Particle Accelerators.

The influence of the ionization losses in the diagnostic foil on the longitudinal motion of charge particles at the JINR Phasotron is considered. The main effects, which are obtained analytically and confirmed by numerical calculations, consist in the synchronous phase shift and the phase oscillations amplitude compression. 8 refs., 11 figs.

16364 (SLAC/AP–100) **Notes on lie algebraic analysis of achromats.** Wang, Chunxi; Chao, A. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. Order Number DE95009524. Source: OSTI; NTIS; INIS; GPO Dep.

Normal form technique is a powerful method to analyze the achromat problem. Assume the one cell map $M_{cell} = AR e^{:h_3:} e^{:h_4:} A^{-1}$, where h_3,h_4 are the normal forms of the generators of the unit cell map, and A is the nonlinear transformation that brings M_{cell} into its normal form; then the map of the whole system is $M_N = M_{cell}^N = AR^N A^{-1} = I$, provided that we can set $e^{:h_3:}$, $e^{:h_4:}$, and R^N to the identity (or only δ dependent) maps. Therefore, the conditions to form an achromat are h_3 and h_4 equal to zero (or δ dependent only) and the total linear map is identity. In this report, we will apply these conditions to a FODO array (a simple model system) to make it an achromat. We will start from Hamiltonians and work all the way up to obtain the analytical expressions of the required sextupole and octupole strengths.

The target presents a potential hazard with regard to radiation exposure to personnel during service and maintenance of the cyclotron. To minimize the radiation hazard associated with target handling, the objective was to design a simple, reliable, long-time-between-maintenance, and easily serviced target. This led to a modular concept where the targets consist of a limited number of standardized building blocks. No target is unique in its composition/structure. The targets are designed for manufacturing and assembly simplicity for instance by using an extruded aluminum hollow profile thereby providing a target unit with high reliability and reproducibility. The time for removing/attaching the target from/to the cyclotron is about 0.5 minutes. The time for assembling/disassembling is about 5 minutes. The short handling times reduces the personal dose appreciably.

16366 (BNL–61149, pp. 5-11) **Pushing beam currents to the limit.** Stevenson, N.R. (TRIUMF, British Columbia (Canada)); Nortier, F.M.; Gelbart, W.Z.; Bloemhard, R.; Elzen, R. van den; Hunt, C.; Lofvendahl, J.; Orzechowski, J. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

One of the cyclotron systems running at the Nordion Int. radioisotope production facility at TRIUMF is the EBCO TR30. This cyclotron produces up to 250 μA on each of two beamlines simultaneously. Two solid (for the production of ^{201}Tl, ^{57}Co, ^{67}Ga and ^{111}In) and a gaseous (for producing ^{123}I) target station are in routine operation on this facility. Since future projections indicate a greater demand for reliable radioisotope production there is a program underway to increase the output of the facility to double the present level. One way that this is being achieved is through a careful thermal analysis of the solid target system to maximize its performance. In conjunction with this, the authors have developed and tested a 500 μA upgrade of the solid target system. Gas targets are being investigated for possible ways of increasing the efficiency of production via rotating/sweeping beams which allow

higher beam currents. Finally, the TR30 cyclotron is being upgraded to deliver 50-100% more beam on target. By pushing both the cyclotron and target technology to the limit will produce significantly higher levels of radioisotopes than many other comparable facilities.

16367 (BNL–61149, pp. 130-133) **Overcoming cyclotron energy constraints through targetry.** Finn, R. (Memorial Sloan-Kettering Cancer Center, New York, NY (United States)); Sheh, Y.; Vecchione, J.; Schlyer, D.; Firouzbakht, M. Brookhaven National Lab., Upton, NY (United States). 1994. DOE Contract FG02-86ER60407. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The past decade has witnessed a rapid growth in the number of PET-Cyclotron Facilities, each with specific clinical or research programs. This diversity of research interests has been partially responsible for the evaluation of the potential clinical utility of several radionuclides which had been previously dismissed from further consideration due to the lack of pure positron emitter decay characteristics. The particular nuclear reaction utilized to produce such radionuclides is not always amenable to the classical gas or liquid target. Such is the case in this research effort which requires a solid target irradiation station compatible with a retrofitted Japan Steel Works target changer to The Cyclotron Corporation CS-15 cyclotron. The authors have fabricated such a target from readily available components. The operational characteristics and unique features of the target system are outlined.

16368 (BNL–61149, pp. 219-225) **A target chamber for the routine production of [^{18}F]-F_2.** Dahl, J.R. (Cornell Univ. Medical College, Manhasset, NY (United States)); Belakhlef, A.; Matacchieri, R.A.; Chaly, T.C.; Margouleff, D.; Koziorowski, J. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

[^{18}F]-F_2 continues to provide a convenient route for the preparation of ^{18}F labeled compounds. Due to the smaller cross sectional area of the beam profile which may result when the target is mounted at the end of a beam transport line, a target chamber optimized for use with a cyclotron equipped with a beam transport system may not be optimal for use on a cyclotron with the targets mounted directly on the beam exit port, even though the machines may be otherwise similar. This situation poses the problem: design a target chamber with sufficient reliability and yield to allow pursuit of a clinical research program dependent upon [^{18}F]-F_2 as a radiolabeling precursor and which works well when mounted directly on the beam exit port of a positive ion cyclotron or when mounted at the end of a beam transport line. Such a target will be suitable for use with either a circular beam entrance window for use on a beam line, or with a beam entrance window for the horizontally elongated beam obtained at the beam exit port.

16369 (BNL–61149, pp. 323-329) **Control of radioactive material pneumatic transport system using an inexpensive programmable logic controller.** Dembowski, B. (Hospital of Univ. of Pennsylvania, Philadelphia, PA (United States)); Gonzalez-Lepera, C. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The Flexo-Rabbit Pneumatic Transport System provided by Intertech Nuclear Products Division was installed at the University of Pennsylvania Cyclotron Facility in 1987-88 connecting the Cyclotron Facility to the PET center with 390 m of tubing. The original transport system had two receiving stations, one for the PET center in the University Hospital and one in a Radiochemistry Research Lab located in a Medical Research Building. A diverter station located in line controlled the destination of the transport capsule. With the removal of the research lab station and diverter, modification of the control system was necessary. Space restrictions around the Cyclotron Radiochemistry Lab also demanded a better solution to the Personal Computer/interface box control system, without jeopardizing the systems safety interlocks. The authors selected a Programmable Logic Controller (PLC) and a small control box to replace the original equipment. In addition, a new loading station in an effort to reduce radiation exposure during operation was introduced.

16370 (BNL–61149, pp. 330-332) **Remote/local control circuit for accelerator targets.** Belakhlef, A. (Cornell Univ. Medical College, Manhasset, NY (United States)); Dahl, J.R. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Operating experimental accelerator targets for radioisotope production requires a system which permits manipulation of the apparatus from a position adjacent to the targets during setup, and from the accelerator operating console during irradiation. Targets for producing different radioisotopes are mounted vertically on a target exchanger with vertical motion. These targets produce short-lived radioisotopes that are the basis for synthesizing the tracers used in positron emission tomography. Targets for radioisotope production are filled to specific volume and pressures from as many as five different tank gases, imposing the need for a reliable control of valves with continuous visual monitoring of the valve state. Appropriate signals to indicate the status of the controlled apparatus must be presented visually at both locations. The transient nature of experimental setups requires a highly adaptable control system. Apparatus setup suitable for the system herein described are readily adaptable to microprocessor control, once the operational procedure is developed using this system.

16371 (BNL–61149, pp. 353-356) **Status of the cyclotron/P.E.T. facility at the State University of New York at Buffalo.** Toorongian, S.A.; Haka, M.S. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A new P.E.T./Cyclotron facility has been constructed on the Main St. campus of the State University of New York at Buffalo to service the needs of Nuclear Medicine departments in Buffalo and throughout the Western New York area. This facility is jointly funded and operated by S.U.N.Y. and the Veterans Administration. The cyclotron, as well as the research labs and a nuclear pharmacy to prepare non-positron emitting radiopharmaceuticals, are located in a newly constructed facility on campus. The P.E.T. scanner is located in the Veterans Administration Hospital adjacent to the campus. The two annexes are connected by a pneumatic transport "rabbit" system. The cyclotron and all radiopharmaceutical synthesis apparatus have been purchased from Ion Beam Applications s.a. of Lovain-la-Neuve Belgium.

16372 (BNL–61149, pp. 357-358) **FDG production and quality control at North Carolina Baptist Hospital Bowman Gray School of Medicine P.E.T. Center.** Ehrenkaufer, R.E. (P.E.T. Center, Winston-Salem, NC (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The PET Center at North Carolina Baptist Hospital-Bowman Gray School of Medicine has been in operation since January of 1992. The radioisotope, radiopharmaceutical production hardware are comprised of Siemens/CTI RDS 112, 11 MeV, negative ion (H^-) cyclotron and associated radioisotope and radiopharmaceutical production equipment.

16373 (BNL–61581) **Monte Carlo simulations of muon production.** Palmer, R.B. (Brookhaven National Lab., Upton, NY

(United States)); Gallardo, J.C.; Fernow, R.C.; Torun, Y.; Neuffer, D.; Winn, D. Brookhaven National Lab., Upton, NY (United States). Mar 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9411210–3: 2. workshop on physics potential and development of mu+ mu- colliders, Sausalito, CA (United States), 17-19 Nov 1994). Order Number DE95009554. Source: OSTI; NTIS; INIS; GPO Dep.

Muon production requirements for a muon collider are presented. Production of muons from pion decay is studied. Lithium lenses and solenoids are considered for focusing pions from a target, and for matching the pions into a decay channel. Pion decay channels of alternating quadrupoles and long solenoids are compared. Monte Carlo simulations are presented for production of $\pi \rightarrow \mu$ by protons over a wide energy range, and criteria for choosing the best proton energy are discussed.

16374 (FNAL/C–95/039) **Operations aspects of the Fermilab Central Helium Liquefier Facility.** Geynisman, M.G.; Makara, J.N. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950350–1: 10. intersociety cryogenic symposium, Houston, TX (United States), 19-23 Mar 1995). Order Number DE95009109. Source: OSTI; NTIS; INIS; GPO Dep.

The Fermilab Central Helium Liquefier (CHL) facility consists of helium and nitrogen reliquefier plants operated 24 hours-a-day to supply LHe at 4.6°K and LN_2 for the Fermilab Tevatron superconducting proton-antiproton collider ring and to recover warm return gases. Operating aspects of CHL, including different equipment and systems reliability, availability, maintenance experience, safety concerns, and economics aspects are discussed.

16375 (FNAL-TM–1926) **Calculated secondary yields for proton broadband using DECAY TURTLE.** Sondgeroth, A. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95008955. Source: OSTI; NTIS; INIS; GPO Dep.

The calculations for the yields were done by Al Sondgeroth and Anthony Malensek. The authors used the DECAY deck called PBSEC_E.DAT from the CMS DECKS library. After obtaining the run modes and calibration modes from the liaison physicist, they made individual decay runs, using DECAY TURTLE from the CMS libraries and a production spectrum subroutine which was modified by Anthony, for each particle and decay mode for all particle types coming out of the target box. Results were weighted according to branching ratios for particles with more than one decay mode. The production spectra were produced assuming beryllium as the target. The optional deuterium target available to broadband will produce slightly higher yields. It should be noted that they did not include pion yields from klong decays because they could not simulate three body decays. Pions from klongs would add a very small fraction to the total yield.

16376 (FNAL-TM–1927) **Calculated dose rates in halls using CASIM.** Sondgeroth, A. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95008954. Source: OSTI; NTIS; INIS; GPO Dep.

The first part of this document shows the results of a series of CASIM runs designed to optimize the size of a steel cylinder so as to produce the highest density of stars at any given radius perpendicular to beam direction. For the next set of runs the length of the cylinder is now fixed at three meters and the authors vary the radius. These runs show that a cylinder with a radius of seven centimeters produces the highest dose rate. For the rest of the CASIM runs a cylinder three meters long with a radius of seven centimeters will be used. Using the optimized cylinder they now make runs using geometries more closely representing real experimental hall geometries in an attempt to predict possibly dose rates.

16377 (FNAL-TM–1929) **Reducing process noise in superconducting helium liquid level probes.** Brubaker, J. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95008956. Source: OSTI; NTIS; INIS; GPO Dep.

This memo presents methods to reduce the process noise accompanying the use of superconducting helium liquid level probes in a splashing environment. The development of these methods followed unsatisfactory operation of unmodified, commercially available, level probes used in each of the 24 valve box dewars of Tevatron refrigerators. The dewars function both as reservoirs of refrigeration and as phase separators at the inlet of the cold compressors used in subatmospheric magnet cooling operation.

16378 (IFVE-OKU–93-132) **On possibility of the GAMS-4π operation at positive coordinates of internal targets in block 27 of IHEP accelerator.** Aseev, A.A.; Gorin, M.Yu.; Zelenov, B.A.; Kardash, A.A.; Medvedev, V.A. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 11p. (In Russian). Order Number DE95628723. Source: OSTI; NTIS (US Sales Only); INIS.

The impossibility to realize a simultaneous proton extraction to FODS-2 and SWD of beam line 22 hindered the operation of GAMS-4π facility with π^--meson beam at the intensity of 2×10^7 p/c, which is achievable with an internal target in block 27 at positive coordinates. It was determined by technical capabilities of the slow extraction equipment. A possibility of an additional effect on the extracted proton beam was found during investigations, that allowed one to spill onto the last septum-magnet of the extraction system. 10 refs., 6 figs.

16379 (INIS-JP–029, pp. 63-65) **Development of stripper films made of high strength, long life carbon nitride.** Oyaizu, Mitsuhiro (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study); Sugai, Isamu; Yoshida, Koji; Haruyama, Yoichi. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

The heavy ion accelerators such as tandem type van de Graaff, linear accelerators, cyclotrons and so on raise the acceleration efficiency usually by producing multivalent ions by making the charge conversion of heavy ions using carbon thin films. However, when the electrons of large atomic number ions of low energy, high intensity current are stripped, the conventional carbon thin films on the market or home made were very short in their life, and have become the cause of remarkably lowering the acceleration efficiency. The concrete objectives of the development are the use of the charge conversion of unstable nuclear ions in the E arena accelerator for JHP of the future project of Institute of Nuclear Study and the manufacture of the carbon films which are used for the charge conversion of the H beam of high energy, but at the time of exchanging the films, there is the problem of the radiation exposure of large amount, therefore, the development of high reliability, long life stripper films has been strongly demanded. The experiment was carried out by controlled carbon arc discharge process using both AC and DC and the ion beam sputtering process using reactive nitrogen gas. The results are reported. (K.I.).

16380 (INP–1676/AP) **The problems of high efficient extraction from the isochronous cyclotron.** Schwabe, J. (Institute of Nuclear Physics, Cracow (Poland)). Institute of Nuclear Physics, Cracow (Poland). Jun 1994. 20p. Order Number DE95628724. Source: OSTI; NTIS; INIS.

The problem of high efficient extraction ($\eta \geq 50\%$) from isochronous cyclotrons (with the exception of the stripping method) is not completely solved up to this day. This problem is specifically important, because these cyclotrons are being also applied in the production of medical radioisotopes, labeled pharmaceuticals as well as in neutron therapy (oncology), machine industry, agriculture (plant mutagenesis), etc. The aim of the proposed topic is to solve this problem on the AIC-144 isochronous cyclotron in the INP (Institute of Nuclear Physics). Lately, a beam of 20 MeV deuterons with an efficiency of ca. 15% was extracted from this cyclotron. (author). 25 refs, 14 figs.

16381 (IYaF–93-110) **Injection and laser acceleration of ions based on the resonant surface photoionization.** Antsiferov, V.V.; Smirnov, G.I.; Telegin, G.G. AN SSSR, Novosibirsk (Russian

Federation). Inst. Yadernoj Fiziki. 1993. 11p. (In Russian). Order Number DE95628726. Source: OSTI; NTIS (US Sales Only); INIS.

The collective effects have been investigated of the injection and acceleration of the ion beams due to the resonant surface photoionization. The considered scheme of the laser accelerator allows to obtain positive ions with relativistic velocities. 11 refs., 2 figs.

16382 (JINR–9-92-225) **A transport line for beams of separated muons from the JINR phasotron to a low-background laboratory.** Andreev, E.M.; Dem'yanov, A.V.; Mamedov, T.N.; Roganov, V.S.; Tsupko-Sitnikov, V.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. 15p. (In Russian). Order Number DE95626797. Source: OSTI; NTIS (US Sales Only); INIS.

Meson channel 2 of the JINR phasotron for transportation of separated muon beams to the low-background laboratory is described. Changes in the design of the magnetic analyser of the beamline 2 not only increased the intensity by a factor of more than 2 but also improved the spatial distribution of the beam at its exit. For negative muons of momentum 125 MeV/c the intensity is $6x10^4$ part./s (per 1 μA of the extracted proton beam) with a 9% admixtire of electrons and 0.4% of pions, the momentum resolution of the channel is +-6 MeV/c. The intensity of the 125 MeV/c posiive muon beam is $2x10^5$ part./s per 1μA of the proton beam, the positron admixture is 3%. 9 refs.; 7 figs.; 1 tab.

16385 (JINR-E–9-94-369) **Charge Exchange Injection of Heavy Ions in Synchrotrons.** Angelov, V. (Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika); Dinev, D.; Tsenov, S.; Dmitriev, I.; Mikhajlov, V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 34p. Order Number DE95626789. Source: OSTI; NTIS (US Sales Only); INIS.

The problems of the charge exchange injection of heavy ions into synchrotrons are discussed. The local orbit bump stimulated by three or four magnets is described for the case of general element arrangement. Formulas for the emittance growth due to the multiple scattering in the stripper and to the ionization losses (with non-zero dispersion) are deduced. The additional parameters are calculated. Two modes of ion storage are considered with fixed and moving orbit bumps. A procedure for calculating of the second mode is given. All these relations are applied to the NUCLOTRON booster, being now under design at the Laboratory of High Energies. 33 refs., 10 figs.; 7 tabs.

16386 (JINR-E–9-94-398) **Calculation of Gas Mixing Effect in ECR Ion Source.** Zhao Hongwei (Academia Sinica, Lanzhou, GS (China). Inst. of Modern Physics); Efremov, A.A.; Kutner, V.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1994. 20p. Order Number DE95626786. Source: OSTI; NTIS (US Sales Only); INIS.

Presented to the 7-th International Conference on the Physics of Highly Charged Ions, Sep 1994, Vienna, Austria.

The gas mixing effect in electron cyclotron resonance (ECR) multicharged ion source consists in a substantial increase to the current of high charge state ions. In order to understand mechanism of the gas mixing effect, the effects of support gas (O_2) on the ion (Ar) charge state distribution, the plasma potential, the potential dip, the average charge state, the electron scattering rate, and the thermal electron density are studied numerically on the basis of a simple balance model. The dependence of the ion charge state distribution on the ion temperature, the hot electron temperature and the hot electron density are also calculated. The calculated charge state distributions are fitted with the experimental data of two different ECR ion sources. Finally, we point out that it might be the combination of the several factors that results in the gas mixing effect. 18 refs., 17 figs.

16387 (SAND–95-0686C) **Cryogenic thermometry in superconducting accelerators.** Datskov, V.I. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Cryogenics Dept.); Demko, J.A.; Hentges, M.; Weisend, J.G. Sandia National Labs., Albuquerque, NM (United States). 4 Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950512–1: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95009864. Source: OSTI; NTIS; INIS; GPO Dep.

The cryogenic thermometers used in superconducting accelerators must function in very adverse environments. Typical conditions are a temperature range of 1.5–300 K, high irradiation doses and magnetic fields which must be endured for the 20 to 50 year life of the accelerator. The authors determined the principal requirements for cryogenic thermometers in accelerator installations and for industrial applications. Some constructions of the thermometer mounting fixtures used in the "Nuclotron" (Dubna, Russia) and the SSCL (Dallas, USA) accelerator installations are described. The experimental results for long-term stability of the cryogenic thermometers applied are presented. The basic recommendations on the application technology of the cryogenic thermometers in large superconducting accelerator systems are given.

16388 (SLAC-PUB–95-6755) **RF pulse compression for future linear colliders.** Wilson, P.B. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9410218–9: Pulsed radio frequency sources for linear colliders, Long Island, NY (United States), 2-7 Oct 1994). Order Number DE95010330. Source: OSTI; NTIS; INIS; GPO Dep.

Future (nonsuperconducting) linear colliders will require very high values of peak rf power per meter of accelerating structure. The role of rf pulse compression in producing this power is examined within the context of overall rf system design for three future colliders at energies of 1.0–1.5 TeV, 5 TeV and 25 TeV. In order keep the average AC input power and the length of the accelerator within reasonable limits, a collider in the 1.0–1.5 TeV energy range will probably be built at an x-band rf frequency, and will require a peak power on the order of 150–200 MW per meter of accelerating structure. A 5 TeV collider at 34 GHz with a reasonable length (35 km) and AC input power (225 MW) would require about 550 MW per meter of structure. Two-beam accelerators can achieve peak powers of this order by applying dc pulse compression techniques (induction linac modules) to produce the drive beam. Klystron-driven colliders achieve high peak power by a combination of dc pulse compression (modulators) and rf pulse compression, with about the same overall rf system efficiency (30–40%) as a two-beam collider. A high gain (6.8) three-stage binary pulse compression system with high efficiency (80%) is described, which (compared to a SLED-11 system) can be used to reduce the klystron peak power by about a factor of two, or alternately, to cut the number of klystrons in half for a 1.0–1.5 TeV x-band collider. For a 5 TeV klystron-driven collider, a high gain, high efficiency rf pulse compression system is essential.

4304 Storage Rings

16389 (ENEA-RT-INN–94-47) **Storage-ring fel longitudinal dynamics.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Giannessi, L.; Renieri, A. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. May 1994. 24p. (RT/INN–94-47). Order Number DE95771026. Source: OSTI; NTIS (US Sales Only).

The modifications induced on the longitudinal dynamical behaviour of an e-beam circulating in a Storage-Ring (S.R.) and undergoing a FEL (Fokker-Planck equation) interaction are studied. The low gain amplifier case and, using the Fokker-Planck equation, is discussed and it is evaluated the effect of the FEL interaction on the longitudinal damping time, which is shown to be a funcion of the detuning parameter and the intensity itself. A self-consistent model of the S.R. FEL dynamics capable of including saturation, induced energy spread and damping time modifications is developed. The model is shown to be particularly useful to investigate the system evolution and the interplay between the various features causing the saturation of the device.

16392 (BARC–1994/E/038) **Automatic processing of gamma ray spectra employing classical and modified Fourier transform approach.** Rattan, S.S. (Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Division); Madan, V.K. Bhabha Atomic Research Centre, Bombay (India). 1994. 21p. Order Number DE95628031. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes methods for automatic processing of gamma ray spectra acquired with HPGe detectors. The processing incorporated both classical and signal processing approach. The classical method was used for smoothing, detecting significant peaks, finding peak envelope limits and a proposed method of finding peak limits, peak significance index, full width at half maximum, detecting doublets for further analysis. To facilitate application of signal processing to nuclear spectra, Madan et al. gave a new classification of signals and identified nuclear spectra as Type II signals, mathematically formalized modified Fourier transform and pioneered its application to process doublet envelopes acquired with modern spectrometers. It was extended to facilitate routine analysis of the spectra. A facility for energy and efficiency calibration was also included. The results obtained by analyzing observed gamma-ray spectra using the above approach compared favourably with those obtained with SAMPO and also those derived from table of radioisotopes. (author). 15 refs., 3 figs., 3 tabs.

16393 (CERN–94-07) **International workshop on advanced materials for high precision detectors. Proceedings.** Nicquevert, B. (ed.); Hauviller, C. (ed.). European Organization for Nuclear Research, Geneva (Switzerland). 25 Oct 1994. 211p. (CONF-9409327–: International workshop on advanced materials for high precision detectors, Archamps Haute Savoie (France), 28-30 Sep 1994). Order Number DE95626965. Source: OSTI; NTIS (US Sales Only); INIS.

These proceedings gather together the contributions to the Workshop on Advanced Materials for High Precision Detectors, which was held from 28-30 September 1994 in Archamps, Haute-Savoie, France. This meeting brought together international experts (researchers, physicists and engineers) in the field of advanced materials and their use in high energy physics detectors or spacecraft applications. Its purpose was to discuss the status of the different materials currently in use in the structures of detectors and spacecraft, together with their actual performances, technological implications and future prospects. Environmental effects, such as those of moisture and radiation, were discussed, as were design and manufacturing technologies. Some case studies were presented. (orig.).

16394 (CONF-9304128–, pp. B.26-B.34) **Los Alamos Mobile Radiological Laboratory fielded during post shot drilling operations at the Nevada Test Site.** Carpenter, J. (Los Alamos National Lab., NM (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory Health Physics group fields a 10 x 50 semi trailer housing radiation detection systems during each post shot drilling operation. A discussion of the post shot drilling equipment, procedures, and radiological concerns are included together with a description of the radiation detection systems installed in the trailer. Each detection system is integrated with the drilling and "containment" features to provide continuous radiological monitoring of a Continuous Air Monitoring (CAM) on the rig floor, radiological gases in the cellar and annulus of the blow out preventer (BOP), estimate of activity released through a breach of the containment system, and direct radiological monitoring of the fluid returns during the drilling process. The containment features of the drilling operation and the detection systems in the trailer are calibrated annually as an integrated system by releasing Xenon-133 gas in the cellar and tracking it through the system.

16395 (CONF-9408213–1) **First results with the Microball and Gammasphere.** Sarantites, D.G. (Washington Univ., St. Louis, MO (United States). Dept. of Chemistry); Hua, P.F.; LaFosse, D. Oak Ridge National Lab., TN (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on physics from large gamma-ray detector arrays; Berkeley, CA (United States); 2-6 Aug 1994. Order Number DE95009614. Source: OSTI; NTIS; INIS; GPO Dep.

The Microball, an improved 4π multi-detector array, was used recently in conjunction with Gammasphere in three experiments. Highlights of the first results are presented here. The Microball consists of 95 CsI(T*l*) scintillation detectors with individual Si photodiode readout, arranged in 9 rings. In these first experiments the Microball performed as designed, but the results in new physics exceeded the authors' expectations. They can say with certainty that by its powerful channel selection the Microball enhanced the performance of Gammasphere by one full coincidence fold. This was possible for all exit channels involving charged particle emission, with increasing performance benefit as one progressed to

lighter reaction systems. They summarize the essential characteristics of the Microball and give some performance benchmarks. A detailed description of the Microball is given.

16396 (DESY–95-005) **Simulation of the ZEUS calorimeter.** Iga, Y. ZEUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jan 1995. 20p. Order Number DE95770018. Source: OSTI; NTIS (US Sales Only); INIS.

The simulation of the ZEUS uranium-scintillator calorimeter is presented. It is based on the GEANT and GHEISHA Monte Carlo packages. To simulate the high resolution calorimater with adequate precision and feasible execution time, two fast, tunable shower terminators have been developed. One of them (electromagnetic shower terminators) is applied for electromagnetic particles and the other (neutron shower terminators) for hadronic interactions inside the uranium calorimeter. The calorimeter simulation was tuned and verified with extensive data, obtained with prototype and production modules in test-meams at CERN and Fermilab. The simulation reproduces the energy resolution and e/h ratio for momenta down to 0.5 GeV/c. The simulated longitudinal and transverse shower profiles also agree reasonably well with data. Effects caused by the boundary between read-out cells and by extra material in front of the calorimeter are also reproduced well by the simulation. The shower terminators reduce the execution time by a factor of about 15. (orig.)

16397 (DOE/ER/40445–46) **The design and construction of the muon arm in PHENIX. Progress report for the period December 15, 1993–December 1, 1994.** Kirk, P.N. Louisiana State Univ., Baton Rouge, LA (United States). Intermediate Energy Nuclear Physics Group. 15 Dec 1994. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER40445. Order Number DE95010156. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to describe activities performed by the Intermediate Energy Nuclear Physics Group (IENPG) at the Louisiana State University (LSU). The report will cover the period of time between approximately December 15, 1993, and the present. The principal focus of the activities is the muon subgroup of the PHENIX Collaboration. During the preceding year the authors have contributed substantially to the development of hardware for the muon arm of PHENIX and have undertaken an important simulation that will be discussed in the accompanying renewal proposal. The authors are, however, in the process of concluding other activities, most notably their membership in the Di-Lepton Spectrometer (DLS) Collaboration at LBL. During the preceding year the authors have undertaken a major calculation on behalf of the DLS Collaboration. Because of its fundamental nature, its importance to the DLS Collaboration, and its applicability to any other spectrometer, they shall discuss this calculation in considerable detail, both in this progress report and the accompanying renewal proposal. In addition they are members of the E866 Collaboration at Fermilab and the AMY Collaboration at KEK.

16398 (FNAL/C–94/150-E) **Implementation of the shower max electron trigger at CDF.** Byrum, K. (Argonne National Lab., IL (United States)); Dawson, J.; Nodulman, L.; Wicklund, A.B.; Amidei, D.; Burkett, K.; Gerdes, D.; Miao, C.; Wolinski, D. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1994. 18p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Istituto Nazionale di Fisica Nucleare, Rome (Italy);Ministry of Education, Science and Culture (Japan);Natural Sciences and Engineering Research DOE Contract AC02-76CH03000. (CONF-940722–44: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95006684. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have built and installed new electronics which brings the central shower max detector into the CDF Level-2 trigger. By matching a stiff track from the central fast track processor to an associated shower max cluster, this trigger improvement reduces the electron Level-2 cross section by approximately 50% while retaining greater than 85% of real electrons and allows the authors to lower their electron trigger threshold.

16399 (FNAL/C–95/01-E) **Performance and calibration of the D0 uranium liquid-argon calorimeter.** Guida, J. (State Univ. of New York, Stony Brook, NY (United States)). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-941060–5: 4. international conference on advanced technology and particle physics, Como (Italy), 3-7 Oct 1994). Order Number DE95007961. Source: OSTI; NTIS; INIS; GPO Dep.

The performance of the Dϕ uranium liquid-argon calorimeter is discussed, as well as the electromagnetic energy calibration. Results from test beam studies and collider data are incorporated to estimate the energy scale. The ϕ symmetry of the events is used to improve the understanding of the electromagnetic part of the calorimeter, and the EM energy scale is determined from $Z \rightarrow e^+e^-$ events. The calorimeter's response to other resonances is also investigated.

16400 (FNAL/C–95/037) **Backgrounds and detector performance at a 2 x 2 TeV $\mu^+\mu^-$ collider.** Foster, G.W.; Mokhov, N.V. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9411210–1: 2. workshop on physics potential and development of mu+ mu- colliders, Sausalito, CA (United States), 17-19 Nov 1994). Order Number DE95009107. Source: OSTI; NTIS; INIS; GPO Dep.

The rich physics potential of a high-energy high-luminosity $\mu^+\mu^-$ collider and the surprising feasibility of a design attract the attention of many people these days. A few issues define the practicality of such a project, with the enormous particle background levels in a detector due to unavoidable reasons holding first place. In contrast to hadron colliders where particle backgrounds come both from interaction point (IP) and accelerator, almost all the backgrounds in the muon collider detectors arise in the machine. The decay length for 2 TeV muons is $\lambda_D{}^{-1} \sim 10^{-7}$ m^{-1}. With 10^{12} muons in a bunch one has 10^5 decays per meter in a single pass through an interaction region, and 10^8 decays per meter per 12 msec store. This paper examines two major classes of detector backgrounds presented in the muon collider: beam halo backgrounds, and the "direct" backgrounds from electrons from $\mu \rightarrow e\nu\bar{\nu}$ decay occurring in the beam channel. The authors describe the nature of both of these backgrounds, provide results of first realistic calculations for both sources and discuss their effects on plausible detectors. Various shielding and collimation geometries have been simulated, and their efficacy and the nature of the surviving background discussed.

16401 (IFVE-OEA–93-114) **Some algorithms of the events recognition in the Tagged Neutrino Facility.** Mukhin, S.A. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 12p. (In Russian). Order Number DE95628785. Source: OSTI; NTIS (US Sales Only); INIS.

Some algorithms of the events recognition in Tagged Neutrino Facility are described: the event localization in Bars neutrino detector, the off-line trigger, the reconstruction of events vertex, events reconstruction in Tagging Station. The programming package for realization of clusterization methods that have been used for mentioned algorithms realization is presented. 6 refs., 2 tabs.

16402 (IFVE-OEIUNK–93-115) **Vertex microstrip detector. Design and performances.** Grebenev, V.N. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Loginov, A.I.; Maloletnev, A.A. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 8p. (In Russian). Order Number DE95628786. Source: OSTI; NTIS (US Sales Only); INIS.

The vertex detector consisting of eight silicon microstrip planes with high space resolution was designed for use on the set-up VES of IHEP. Test results are given for single detector plane using IHEP accelerator beam. 4 refs., 4 figs.

16403 (IFVE-ONF–93-122) **Characteristics of modular compound photon-hadron sampling-calorimeter.** Barkov, B.P. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki); Katinov, Yu.V.; Lisin, V.I.; Nozdrachev, V.N.; Semenov, V.K.; Slobobyuk, E.A. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 18p. (In Russian). Order Number DE95628787. Source: OSTI; NTIS (US Sales Only); INIS.

A prototype of a compound electromagnetic-hadron calorimeter, consisting of consecutive independent electromagnetic and hadron sampling-calorimeters, was tested in π^- beam at 40 GeV. The energy and mass resolution are obtained as the function of relative energy deposition in electromagnetic and hadron parts of the calorimeter. GEANT calculation of energy deposition is in a reasonable agreement with experimental data, but hadron beam calibration of the detector is essential for accurate measurement of shower energy and position. The compound detector has better energy and coordinate resolution and better ability to identify electromagnetic and hadron showers. 26 refs., 11 figs., 1 tab.

16404 (IFVE-ONF–93-128) **Versions of tubes combining for ionization 'spaghetti'-calorimeter.** Misyura, S.P.; Smol', A.V. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 29p. (In Russian). Order Number DE95628788. Source: OSTI; NTIS (US Sales Only); INIS.

The theoretical analysis of some electrical schemes of tubes combining intended for ionization 'spaghetti'-calorimeter is presented. The expediency of the parallel tubes connection is shown for all schemes being considered. The restrictions for the parameters of scheme elements (blocking capacitors, matching transformer etc.) have been deduced. 10 refs., 23 figs.

16405 (IHEP–93-129) **Radiation transparent mirrors for RICH (ring-imaging Cherenkov counters).** Braem, A. (European Organization for Nuclear Research (CERN), Geneva (Switzerland). Accelerator School); Kostrikov, M.E. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 8p. Order Number DE95628800. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of obtaining beryllium substrates suitable for mirrors with average thickness of less than 1% of radiation length is demonstrated. 15 refs., 3 figs., 1 tab.

16406 (IHEP–93-153) **Separation of the overlapping electromagnetic showers in the cellular GAMS-type calorimeters.** Lednev, A.A. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 10p. Order Number DE95628789. Source: OSTI; NTIS (US Sales Only); INIS.

The structure of gamma reconstruction program for the GAMS spectrometer is described. Reconstruction efficiencies of two and three space-overlapping showers for detectors with different cell size are presented. 3 refs., 17 figs.

16407 (INEL–94/0003) **Test plan for glove box testing with the real-time transuranic dust monitor.** Partin, J.K.; Fincke, J.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95008621. Source: OSTI; NTIS; INIS; GPO Dep.

This test plan describes the objectives, instrumentation, and testing procedures used to prove the feasibility of a real-time transuranic dust monitor (RTDM). The RTDM is under development at the Idaho National Engineering Laboratory (INEL) as a Waste Characterization Technology funded by the Buried Waste Integrated Demonstration Project. The instrument is an in situ monitor that uses optical techniques to establish particle size, particle number density, and mass and species of heavy metal contamination. US Department of Energy orders mandate the assessment of radiological exposure and contamination spread during the remediation of radioactive waste. Of particular concern is heavy metal contamination of dust, both radioactive and nonradioactive. Small particles of metal, particularly the radioactive species, tend to become electrically charged and consequently attach themselves to dust particles. This airborne activated dust is a primary means of contamination transport during remediation activities, and therefore, must be continuously monitored to protect personnel involved in the operations and to control the spread of contamination. If real-time monitoring is not available there is increased likelihood of generating unacceptably high levels of contamination and being forced to shut down costly retrieval operations to decontaminate. A series of experiments are described to determine the optimal experimental design, operational parameters, and levels of detection for the RTDM. Initial screening will be performed using monodisperse particle standards to set parameters and calibrate the instrument. Additional testing will be performed using INEL soil samples spiked with a surrogate, cerium oxide, to prove the design before transporting the apparatus to the Test Reactor Area for testing with plutonium-contaminated dusts.

16408 (INIS-BR–3491) **Electret ionization chamber: a new method for detection and dosimetry of thermal neutrons.** Ghilardi, A.J.P. Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica. 1988. 153p. (In Portuguese). Order Number DE95627022. Source: OSTI; NTIS (US Sales Only); INIS.

An electret ionization chamber with boron coated walls is presented as a new method for detecting thermal neutrons. The efficiency of electret ionization chambers with different wall materials for the external electrode was inferred from the results. Detection of slow neutrons with discrimination against the detection of γ-rays and energetic neutrons was shown to depend on the selection of these materials. The charge stability over a long period of time and the charge decay owing to natural radiation were also studied. Numerical analysis was developed by the use of a micro-computer PC-XT. Both the experimental and numerical results show that the sensitivity of the electret ionization chamber for detection of thermal neutrons is comparable with that of the BF_3 ionization chamber and that new technologies for deposition of the boron layer will produce higher efficiency detectors. (author). 102 refs, 32 fig, 10 tabs.

16409 (INIS-mf–14483, pp. 151) **Three-axis neutron diffractometer for study of residual stresses in polycrystalline materials.** Lukas, P. (Ceska Akademie Ved, Rez (Czech Republic). 16415 (INS–1088) **High resolution and two-dimensional focal plane detector for intermediate energy heavy ions.** Tanaka, M.H.; Fuchi, Y.; Kubono, S.; Kawashima, H.; Takaku, S.; Ichihara, T. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jan 1995. 15p. Order Number DE95767951. Source: OSTI; NTIS; INIS.

A large-area, high-resolution two-dimensional position sensitive gas detector has been developed for intermediate energy heavy ions. The x position information is obtained by a multi-cathode read-out method and the y position by measuring the drift time of electrons. This detector has no left-right ambiguity and very little dead layer in the sensitive area, resulting in a detector system which is thin and homogeneous in the whole sensitive area. The overall position resolution of 0.20 mm and 0.4 mm (FWHM) were obtained for x and y directions, respectively. The position resolutions at lower gas pressure were also measured to find an optimum operating condition to reduce multiple scattering effect from the window foils and the detector gas. This detector has been shown to be very useful for high-resolution heavy ion experiments at intermediate energies. (author).

Order Number DE95628037. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods.

The response of a sampling tile electromagnetic calorimeter was simulated for incident electrons in 10-500 GeV energy range. The influence of tile to tile nonuniformity on the a and b coefficients of the calorimeter energy resolution parametrisation formula was investigated in detail. An energy resolution deterioration due to nonuniformity was observed, but it was shown that the tower by tower calibration can reduce this undesirable effect to reasonable limits. An explicit a and b coefficients dependence on σ_{non}, the tile response nonuniformity standard deviation, was found. Our previous results on this dependence obtained by analytical methods using the electromagnetic shower mean profile universal parametrisation and the present results obtained by Monte Carlo simulation are compared and found in good agreement. 7 refs., 9 figs., 6 tabs.

Submitted to Nuclear Instruments and Methods in Physics Research. Section A, Accelerators, Spectrometers, Detectors and Associated Equipment.

The time-of-flight method for a measurement of thermal neutron spectra in the pulsed neutron sources with high efficiency of neutron registration, more than 10^5 times higher in comparison with traditional one, is described. The main problems connected with the electric current technique for time-of-flight spectra measurement are examined. The methodical errors, problems of a special neutron detector design and other questions are discussed. Some experimental results, spectra from surfaces of the water and solid methane moderators, obtained in the pulsed reactor IBR-2 (Dubna, Russia) are presented. 4 refs., 5 figs.

16420 (JINR-E–13-91-427) **Fourier transform microscope of the direct observation for nuclear emulsion.** Batusov, Yu.A.; Soroko, L.M.; Tereshchenko, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 12p. Order Number DE95626967. Source: OSTI; NTIS (US Sales Only); INIS.

'The fourier transfom (FT) microscope of the direct observation' for tracks of charged particles in the nuclear emulsion is described. The working flow charts are given of the digital processing of the signals from the array of photodetectors disposed just behind the narrow transmitting slit in the FT plane. The general theory of this new device is presented. The net effect of the proposed processing algorithms is discussed. It is shown experimentally that with such a system we can detect the particle tracks with linear density of 40 silver grains per 100 μm with initial signal-to-noise ratio 1:3. The recommendations for the searching for the particle tracks of low ionization level in the nuclear emulsion by means of the FT microscope of the direct observation are described. 9 refs.; 15 figs.; 1 tab.

Lab. of High Energy); Fateev, O.V.; Geltenbort, P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 8p. Order Number DE95628038. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Pribory i Tekhnika Ehksperimenta.

A microstrip gas chamber built on the microstrip plate ILL-6C has been studied. A maximum gas gain of $2 \cdot 10^4$ and an energy resolution of 18% (FWHM) at 6 keV have been measured with an Ar-CH_4 gas mixture at atmospheric pressure. A spatial resolution about 500 mkm (FWHM) has been obtained using a delay line for the second coordinate readout. 3 refs., 6 figs.

16422 (JINR-E–15-94-471) **Large Area High-Efficiency Time-of Flight System for Detection of Low Energy Heavy Evaporation Residues at the Electrostatic Separator VASSILISSA.** Andreev, A.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions); Bashevoj, V.V.; Bogdanov, D.D. Joint Inst. for Nuclear Research, Dubna (Russian

Federation). Lab. of Nuclear Reactions. 1994. 12p. Order Number DE95628033. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods.

A large-area thin timing detector for slow heavy nuclei was developed. The apparatus is based on the transport of secondary electrons by micro-channel plate multipliers. To increase the registration efficiency secondary electrons are collected from the both sides of the emitter foil. An intrinsic time of (380±30) ps and registration efficiency of (95±5) % were obtained for the single TOF detector using ^{226}Ra α-source. A time resolution of (400±30) ps and registration efficiency close to 100% were measured for heavy ions for the single TOF detector. A time-of-flight system consisting of such detectors is extensively used in the experiments with heavy nuclei at the kinematic separator VASSILISSA [1,2]. 12 refs., 6 figs., 2 tabs.

16423 (JINR-R–3-94-447) **An Improved Experimental Facility for Studying Delayed Neutrons and Preliminary Results of Measuring the β_{eff} Value for ^{233}U Relative to ^{235}U.** Borzakov, S.B.; Dermendzhiev, Eh.; Zamyatnin, Yu.S.; Nazarov, V.M.; Pavlov, S.S.; Rogov, A.D.; Ruskov, I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 13p. (In Russian). Order Number DE95628043. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Atomnaya Energiya.

An improved experimental facility for studying delayed neutron emission has been designed and tested at the Dubna IBR-2 pulsed reactor. The new facility consists of a mirror neutron guide to extract thermal and cold neutrons from the beam, a slow neutron chopper, which is synchronized with the reactor pulses and a 4π ^{3}He-filled multi counter neutron detector. The use of the slow neutron chopper allows the reactor delayed neutron background to be strongly suppressed. The repetition rate of the reactor pulse is 5 Hz with a half-width of about 215 μs. The weight of different fissile targets which are placed in the middle hole of the neutron detector can vary from 100 mg up to several grams. The mean thermal neutron flux on the target is about $2 \cdot 10^5$ n/sec·cm^2. A method of periodical irradiation of the target combined with the time-of-flight technique is used. The preliminary results on the effective fraction of delayed neutrons for ^{233}U relative to ^{235}U were obtained. The facility gives the possibility to measure β_{eff} value with the statistical accuracy better than 1% and to investigate DM groups with half-lives less than 1 second. 13 refs., 5 figs., 2 tabs.

16424 (JINR-R–10-94-434) **A Spectrometric System for Investigation of Magnetic States and Phase Transitions Induced by the Pulse Magnetic Field at the IBR-2 Reactor.** Georgiev, D.G.; Nitts, V.V.; Ostrovnoj, A.I.; Petukhova, T.B.; Sirotin, A.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 8p. (In Russian). Order Number DE95628034. Source: OSTI; NTIS (US Sales Only); INIS.

A spectrometric system of the SNIM-2 device for research at the IBR-2 reactor of magnetic states and phase transitions induced by the pulse magnetic field is described. The software provides: control of two channels for collection of a spectrometric information and registration of the monitor counts; remote control of moving mechanisms; control of the system for measurement and stabilisation of the temperature; automatic measurement of the angle dependence of the diffraction scattering intensity for the single crystal; control of the pulse magnetic facility; automatic orientation of the single crystal. The worked-out programs maintain the graphic mode and provide primary analysis of the spectrometric data. 11 refs., 1 fig.

Submitted to Pribory i Tekhnika Ehksperimenta.

Multi parametric spectrometer for the investigation of alpha, beta-single and EEt-coincidence spectra is described. The spectrometer is used for studies of short lived nuclides ($T_1/2 \geq 1$ s) on the experimental complex YASNAPP-2 working on-line with 660 MeV proton beam of the JINR Phasotron. The semiconductor and scintillation detectors included in the device allowed to solve many problems on radioactive nuclear property investigations as for example the studies of nuclear decay schemes, the measurements of alpha, beta-decay energies and nuclear states time of life and so on. (author). 17 refs., 7 figs.

16426 (LA-UR–95-107) **Detection of contaminants along boreholes with prompt gamma spectroscopy.** Conaway, J. (Los Alamos National Lab., NM (United States)); George, D.; Mikesell, J. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950601–4: Annual meeting of the American Nuclear Society, Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95006297. Source: OSTI; NTIS; INIS; GPO Dep.

Geophysical borehole logging techniques are used for estimating subsurface physical, chemical, geological, and hydrological parameters. Nuclear borehole logging techniques have advantages and disadvantages that tend to be complementary to those of physical sampling and these in situ measurements can help address the drawbacks of physical sampling, including high costs, lengthy delays in obtaining results of analyses from laboratories/under sampling, sample handling problems, and ambiguity in long-term monitoring. As part of an effort to reduce environmental restoration costs, we are evaluating in-situ neutron-induced gamma-ray spectroscopy (multispectral) measurements in boreholes to map environmental contaminants. It has been known for some time that this technology is capable of identifying many elements, but earlier borehole equipment was not very sensitive.

16427 (LA-UR–95-1092) **The performance of neutron scattering spectrometers at a long-pulse spallation source.** Pynn, R. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9504136–1: Long-pulse spallation source (LPSS) workshop, Berkeley, CA (United States), Apr 1995). Order Number DE95009492. Source: OSTI; NTIS; INIS; GPO Dep.

The first conclusion the author wants to draw is that comparison of the performance of neutron scattering spectrometers at CW and pulsed sources is simpler for long-pulsed sources than it is for the short-pulse variety. Even though detailed instrument design and assessment will require Monte Carlo simulations (which have already been performed at Los Alamos for SANS and reflectometry), simple arguments are sufficient to assess the approximate performance of spectrometers at an LPSS and to support the contention that a 1 MW long-pulse source can provide attractive performance, especially for instrumentation designed for soft-condensed-matter science. Because coupled moderators can be exploited at such a source, its time average cold flux is equivalent to that of a research reactor with a power of about 15 MW, so only a factor of 4 gain from source pulsing is necessary to obtain performance that is comparable with the ILL. In favorable cases, the gain from pulsing can be even more than this, approaching the limit set by the peak flux, giving about 4 times the performance of the ILL. Because of its low duty factor, an LPSS provides the greatest performance gains for relatively low resolution experiments with cold neutrons. It should thus be considered complementary to short pulse sources which are most effective for high resolution experiments using thermal or epithermal neutrons.

16428 (MPI-PhE–94-34) **Study of a novel electromagnetic liquid argon calorimeter - the TGT.** Berger, C. (Technische Hochschule Aachen (Germany). 1. Physikalisches Inst.); Braunschweig, W.; Geulig, E.; Schoentag, M.; Siedling, R.; Wlochal, M. RD33 Collaboration. Max-Planck-Institut fuer Physik, Muenchen (Germany). Nov 1994. 23p. (PITHA–94-51; HD-IHEP–94-07). Order Number DE95768934. Source: OSTI; NTIS (US Sales Only); INIS.

The concept and the basic design of a fast, highly granular and compact electromagnetic liquid argon calorimeter are described. This novel calorimeter offers uniform energy response and constant energy resolution independent of the production angle of an impinging particle and of its impact position at the calorimeter. An example of a calorimeter with full rapidity coverage in an application in a collider detector is given. An important aspect of the concept is the electronics for fast signal processing matched to the

short charge collection time. We report on the experience with the realization of a prototype calorimeter module and on its performance in a testbeam exposure. (orig.)

16429 (MPI-PhE–95-03) **Testing and further development of a low-noise SI radiation detector.** Pho Duc, C. Max-Planck-Institut fuer Physik, Muenchen (Germany); Muenchen Univ. (Germany). Sektion Physik. Feb 1995. 78p. (In German). Order Number DE95768483. Source: OSTI; NTIS (US Sales Only); INIS.

The functionality of a double DEP-MOSFET was proved, and the attempted improvement of energy resolution was achieved by controlling the signal electrons. The numerical simulation of the detector function provided important information for this. The experiment was caried out as an independent project with specially developed hardware and software. In particular, the absolute mesasurement of the output signal with subsequent data analysis was implemented, which is necessary for multiple selection. On the basis of the experimental findings, conclusions are drawn for the further development of this detector concept.

16430 Directional fast-neutron detector. Byrd, R.C. To Dept. of Energy. 1993. Filed date 29 Mar 1993. U.S. Patent Application 8-038-320. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009987. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A plurality of omnidirectional radiation detectors are arranged in a close packed symmetrical pattern to form a segmented detector. The output radiation counts from these detectors are arithmetically combined to provide the direction of I a source of incident radiation. Directionality is achieved without the use of shielding to provide collimation and background reduction effects. Indeed, output counts from paired detectors are simply subtracted to yield a vector direction toward the radiation source. The counts from all of the detectors can be combined to yield an output signal functionally related to the radiation source strength.

16431 (PTB-E–51) **Electron spin resonance (ESR) spectroscopy applied to radiation dosimetry and other fields.** Schneider, C.C.J. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Abt. Elektrizitaet. Dec 1994. 59p. Order Number DE95768503. Source: OSTI; NTIS (US Sales Only); INIS.

A short introduction to the theory and practice of ESR spectroscopy is given. ESR alanine dosimetry for low and high LET (linear energy transfer) ionising radiation is described, indicating its advantages over traditional methods. Problems arising in the therapy dose range (below 5 Gy), and possible future developments, are mentioned. The application of ESR to the radiation processing of materials and foodstuffs, to geological dating, biology, molecular chemistry and to medicine is discussed. Some examples of chemical analyses are also presented. (orig.)

16432 (PTB-N–21) **Calculations of the response of Bonner spheres with a spherical ^{3}He proportional counter using a realistic detector model.** Wiegel, B.; Alevra, A.V.; Siebert, B.R.L. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Neutronenphysik. Nov 1994. 92p. Order Number DE95768522. Source: OSTI; NTIS (US Sales Only); INIS.

A realistic geometry model of a Bonner sphere system with a spherical ^{3}He-filled proportional counter and 12 polyethylene moderating spheres with diameters ranging from 7,62 cm (3") to 45,72 cm (18") is introduced. The MCNP Monte Carlo computer code is used to calculate the responses of this Bonner sphere system to monoenergetic neutrons in the energy range between 1 meV to 20 MeV. The relative uncertainties of the responses due to the Monte Carlo calculations are less than 1% for spheres up to 30,48 cm (12") in diameter and less than 2% for the 15" and 18" spheres. Resonances in the carbon cross section are seen as significant structures in the response functions. Additional calculations were made to study the influence of the ^{3}He number density and the polyethylene mass density on the response as well as the angular dependence of the Bonner sphere system. The calculated responses can be adjusted to a large set of calibration measurements with only a single fit factor common to all sphere diameters and energies. (orig.)

16433 (SINS–2146/6) **The influence of upstream material on the performance of an electromagnetic calorimeter inside a magnetic field.** Doroba, K. (Warsaw Univ. (Poland). Inst. Fizyki Doswiadczalnej); Krolikowski, J.; Fischer, H.G.; Szeptycka, M.; Szymanski, P. Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland). May 1993. 13p. Grant KBN 20963 91 01. Order Number DE95628790. Source: OSTI; NTIS; INIS.

The deterioration of the calorimeter response to electrons in the presence of upstream materials has been investigated inside a magnetic field. Data for different absorber thickness, distances and electron energies are compared to Monte Carlo calculations. Results are extended to the geometrical situation of a typical collider detector. (author). 4 refs, 11 figs, 1 tab.

16434 (UCRL-JC–117141) **Development of a portable ambient temperature radiometric assaying instrument.** Lavietes, A.D.; McQuaid, J.H.; Ruhter, W.D. Lawrence Livermore National Lab., CA (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941061–19: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95009566. Source: OSTI; NTIS; INIS; GPO Dep.

There is a strong need for portable radiometric instrumentation that can accurately confirm the presence of nuclear materials and allow isotopic analysis of radionuclides in the field. To fulfill this need we are developing a hand-held, non-cryogenic, low-power gamma- and x-ray measurement and analysis instrument that can both search and then accurately verify the presence of nuclear materials. We report on the use of cadmium zinc telluride detectors, signal processing electronics, and the new field-portable instrument based on the MicroNOMAD Multichannel Analyzer from EG&G ORTBC. We also describe the isotopic analysis that allows uranium enrichment measurements to be made accurately in the field.

16435 (UCRL-JC–117142) **Characterization inconsistencies in CdTe and CZT gamma-ray detectors.** Lavietes, A.D.; McQuaid, J.H. Lawrence Livermore National Lab., CA (United States). Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941061–18: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95009567. Source: OSTI; NTIS; INIS; GPO Dep.

In the past few years, significant developments in cadmium telluride (CdTe) and cadmium zinc telluride (CZT) semiconductor materials have taken place with respect to both quality and yield. Many of the more recent developments have occurred in the area of CZT crystal growth. This has resulted in an explosion of interest in the use of these materials in ambient temperature gamma-ray detectors. Most, if not all, of the manufacturers of CdTe and CZT have acquired government funding to continue research in development and applications, indicating the importance of these improvements in material quality. We have examined many detectors, along with the accompanying manufacturer's data, and it has become apparent that a clear standard does not exist by which each manufacturer characterizes the performance of their material. Result is a wide variety of performance claims that have no basis for comparison and normally cannot be readily reproduced. This paper first supports our observations and then proposes a standard that all manufacturers and users of these materials may use for characterization.

16436 (UCRL-JC–118444) **Computer-controlled radiation monitoring system.** Homann, S.G. Lawrence Livermore National Lab., CA (United States). 27 Sep 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941129–22: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95009871. Source: OSTI; NTIS; INIS; GPO Dep.

A computer-controlled radiation monitoring system was designed and installed at the Lawrence Livermore National Laboratory's Multiuser Tandem Laboratory (10 MV tandem accelerator from High Voltage Engineering Corporation). The system continuously monitors the photon and neutron radiation environment associated with the facility and automatically suspends accelerator operation if preset radiation levels are exceeded. The system has proved reliable

real-time radiation monitoring over the past five years, and has been a valuable tool for maintaining personnel exposure as low as reasonably achievable.

4402 Radiation Effects On Instrument Components, Instruments, Or Electronic Systems

16437 (IFVE-ONF–93-95) **Radiation resistance of GaAs structures with built-in π-ν junction.** Vorob'ev, A.P. (Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation)); Krupnyj, G.I.; Rastsvetalov, Ya.N. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 14p. (In Russian). Order Number DE95628819. Source: OSTI; NTIS (US Sales Only); INIS.

The results of studying GaAs samples with build-in π-ν-junction as the base for the construction of the radiation resistant coordinate sensitive detectors are presented. The GaAs samples have been exposed to the beam of the IHEP linear proton accelerator, using Al target for neutron production. The 4-characteristics of GaAs samples have been analyzed to search for the change of its properties. The study of the radiation resistance of the GaAs samples has shown that their main characteristics (charge collection efficiency, signal/noise ratio) degrade less than 20% at the integral neutron fluence of 1.2×10^{15} cm^{-2}. 10 refs., 12 figs., 2 tabs.

16438 (SAND–94-2519C) **Frequency response of a TeO_2 slow shear wave acousto-optic cell exposed to radiation.** Erteza, I.A. (Sandia National Labs., Albuquerque, NM (United States). Optical Systems and Image Processing Dept.); Craft, D.C.; Stalker, K.T.; Taylor, E.W.; Kelley, M.A.; Sanchez, A.D.; Chapman, S.P.; Craig, D.M.; Kinsley, E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 12p. Sponsored by Defense Nuclear Agency, Washington, DC (United States);USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Proposal 91930113. (CONF-950472–5: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95009588. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation testing of photonic components is not new, however component level testing to date has not completely addressed quantities which are important to system behavior. One characteristic that is of particular importance for optical processing systems is the frequency response. In this paper, the authors present the results of the analysis of data from an experiment designed to provide a preliminary understanding of the effects of radiation on the frequency response of acousto-optic devices. The goal is to present possible physical mechanisms responsible for the radiation effects and to discuss the effects on signal processing functionality. The experiment discussed in this paper was designed by Sandia National Laboratories (SNL) and performed by SNL and Phillips Laboratory (PL) personnel at White Sands Missile Range (WSMR). In the experiment, a TeO_2 slow shear-wave acousto-optic cell was exposed to radiation from the WSMR linear accelerator. The TeO_2 cell was placed in an experimental configuration which allowed swept frequency diffracted power measurements to be taken during radiation exposure and recovery. A series of exposures was performed. Each exposure consisted of between 1 to 800, 1 μsec radiation pulses (yielding exposures of 2.25 kRad(Si) to 913 kRad(Si)), followed by recovery time. At low total and cumulative doses, the bandshape of the frequency response (i.e. diffracted power vs. frequency) remained almost identical during and after radiation. At the higher exposures, however, the amplitude and width of the frequency response changed as the radiation continued, but returned to the original shape slowly after the radiation stopped and recovery proceeded. It is interesting to note that the location of the Bragg degeneracy does not change significantly with radiation. In this paper, the authors discuss these effects, and they discuss the effect on the signal processing functionality.

16439 (SINS–2148/4) **Radiation hardness of some semiconductor devices produced in Poland to fast neutrons. Pt. 1. Diodes and transistors.** Bouzyk, J. (Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland)); Augustyniak, E.; Hammer, W. Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland). Jun 1993. 21p. (In Polish). Order Number DE95628821. Source: OSTI; NTIS; INIS.

The paper presents the results of hardness studies of semiconductor devices produced in Poland. Representative measured parameters of 9 electronic components irradiated with fission. D-Be and D-T neutrons with fluencies in the range of 10^{11} - 10^{14} n/cm^2 are given. The results are discussed and lead to the general conclusion that the operation of the semiconductor devices is seriously affected by neutrons with fluences of the order of 10^{13} n/cm^2, some components fail completely at 10^{14} n/cm^2. The radiation damage models of diodes and transistors have been used to calculate the damage coefficients. Ratios of coefficients for the neutrons of 14.7 MeV and fission ones calculated for the transistors and diode are 1.8 and 2.3 respectively. (author). 9 refs, 3 figs, 2 tabs.

16441 (UCRL-ID–114325) **Single event and TREE latchup mitigation for a star tracker sensor: An innovative approach to system level latchup mitigation.** Kimbrough, J.R. (Lawrence Livermore National Lab., CA (United States)); Colella, N.J.; Davis, R.W.; Bruener, D.B.; Coakley, P.G.; Lutjens, S.W.; Mallon, C.E. Lawrence Livermore National Lab., CA (United States). Aug 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010331. Source: OSTI; NTIS; INIS; GPO Dep.

Electronic packages designed for spacecraft should be fault-tolerant and operate without ground control intervention through extremes in the space radiation environment. If designed for military use, the electronics must survive and function in a nuclear radiation environment. This paper presents an innovative "blink" approach rather than the typical "operate through" approach to achieve system level latchup mitigation on a prototype star tracker camera. Included are circuit designs, flash x-ray test data, and heavy ion data demonstrating latchup mitigation protecting micro-electronics from current latchup and burnout due to Single Event Latchup (SEL) and Transient Radiation Effects on Electronics (TREE).

4404 Well Logging Instrumentation

16442 (NEI-NO–541) **Improved reservoir monitoring in HPHT wells.** Godager, Oe. (Smedvig Technology A/S, Toensberg (Norway)); Schmidt, H. Norsk Petroleumsforening, Oslo (Norway). 1994. 8p. (CONF-9408229–48: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766617. Source: OSTI; NTIS.

The conference paper deals with the development of a Dual-channel HPHT (High Pressure/High Temperature) Crystal Quartz Pressure Gauge (DSQPP) instrument. The small-sized instrument can be used in well conditions as high as 1250 Bar and 180°C and with stated accuracies of 0.015% full scale. The instrument characteristics show the ability of measuring correct pressure during thermal gradient periods, and is to be rugged and intensive to the effects of shock, vibration, and radial acceleration. The instrument is able to operate in a continuous on-line monitoring mode or as a high-capacity digital memory pressure-temperature recorder. The paper describes the development, performance parameters, testing, and use of the DSQPP pressure gage in an HPHT well in the Norwegian sector of the North Sea. 2 refs., 7 figs.

16443 (NEI-NO–543) **Advances of MWD technology for HPHT wells.** Llosa, R. (Anadrill International (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 13p. (CONF-9408229–50: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766619. Source: OSTI; NTIS.

The conference paper describes a new MWD (Measurements While Drilling) tool designed to meet the demanding requirements in the drilling of HPHT (High Pressure/High Temperature) wells. 3 refs., 7 figs., 3 tabs.

16444 (NEI-NO–548) **Benefits and technological status of multiphase flow meters for topside and subsea application.** Svaeren, J.A. (Framo Engineering (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 40p. (CONF-9408229–55: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766624. Source: OSTI; NTIS.

The conference paper discusses multiphase flow meters commercially available. According to the author, the accuracy of todays meters are better than test separators. Flow meters can dramatically improve field development economics both for topside and subsea application, they can improve field recovery rates and thereby largely improve field economics, and they can, due to relaxation on fiscal consideration, play an important role in cost effective allocation metering in tie-in of satellite fields to existing infrastructure. 21 figs., 8 tabs.

4405 Thermal Instrumentation

4406 Optical Instrumentation

Refer also to citation(s) 15171, 16279

16445 **Ground plane insulating coating for proximity focused devices.** Power, G.D. To Dept. of Energy. 1993. Filed date 5 Mar 1993. U.S. Patent Application 8-026,797. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009976. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a thin layer of alumina (aluminum oxide) which is coated onto the ground plane of a microchannel plate (MCP) without covering the pores of the MCP so it does not effect the performance. The coating is sputtered onto the ground plane at a very steep angle. The addition of the thin dielectric coating of alumina greatly improves the spatial resolution of proximity focused image intensifiers using a narrow gap between the phosphor screen and the MCP. With the coating on the ground plane and the same gap the phosphor screen can be ran at 9000 volts, as compared to 3kV without the coating.

16446 (SAND–95-0588C) **Current trends in the packaging of photonic devices.** Carson, R.F. Sandia National Labs., Albuquerque, NM (United States). [1995]. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504140–1: Spring meeting on optoelectronic and photonic devices, Tucson, AZ (United States), 6 Apr 1995). Order Number DE95009583. Source: OSTI; NTIS; GPO Dep.

Optoelectronic and photonic devices hold great promise for high data-rate communication and computing. Their wide implementation was limited first by the device technologies and now suffers due to the need for high-precision packaging that is mass-produced. The use of photons as a medium of communication and control implies a unique set of packaging constraints that are highly driven by the need for micron and even sub-micron alignments between photonic devices and their transmission media. Current trends in optoelectronic device packaging are reviewed and future directions are identified both for free-space (3-dimensional) and guided-wave (2-dimensional) photonics. Emphasis will be placed on the special needs generated by increasing levels of device integration.

16447 (SAND–95-0670C) **Sandia National Lab's precision laser tracking systems.** Patrick, D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506174–1: Test Facility working group conference, Las Vegas, NV (United States), 12-16 Jun 1995). Order Number DE95009837. Source: OSTI; NTIS; GPO Dep.

Sandia Labs' mobile tracking systems have only one moving part. The double gimballed 18 inch diameter beryllium mirror is capable of constant tracking velocities up to 5 rads/sec in both axes, and accelerations to 150 rads/sec/sec in both axes. Orthogonality is <10 microradians. The mirror directs the 488 and 514 nm wavelength CW laser beams to adhesive-backed reflective material applied to the test unit. The mirror catches the return beam and visual image, directing the visual image to three camera bays, and the return beam to an image dissector behind an 80 inch gathering telescope. The image dissector or image position sensor is a photomultiplier with amplifying drift tube and electron aperture and its associated electronics. During the test, the image dissector scan senses the change in position of the reflective material and produces signals to operate the azimuth and elevation torque motors in the gimbal assembly. With the help of 1 1/8 inch diameter azimuth and elevation galvonometer steering mirrors in the optical path, the laser beam is kept on the target at extremely high velocities. To maintain a constant return signal strength, the outgoing beam is run through a microprocessor controlled beam focusing telescope.

16448 (SAND–95-0721C) **Scannerless range imaging with a square wave.** Muguira, M.R.; Sackos, J.T.; Bradley, B.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950472–6: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95009840. Source: OSTI; NTIS; GPO Dep.

Scannerless range imaging (SRI) is a unique approach to three dimensional imaging without scanners. SRI does, however, allow a more powerful light source to be used as compared to conventional Laser Radar (LADAR) systems due to the speed of operation associated with this staring system. As a result, a more efficient method of operation was investigated. As originally conceived, SRI transmits a continuous intensity modulated sinusoidal signal; however, a square wave driver is more energy efficient than a sinusoidal driver. In order to take advantage of this efficiency, a square wave operational methodology was investigated. As a result, four image frames are required for the extraction of range using a square wave to unambiguously resolve all time delays within one time period compared to a minimum of three frames for the sinusoidal wave.

16449 (UCRL-ID–119706) **Production and preliminary testing of multianalyte imaging sensor arrays.** Richards, J.B. (Lawrence Livermore National Lab., CA (United States)); Brown, S.B.; Milanovich, F.P.; Healey, B.G.; Chadha, S.; Walt, D.R. Lawrence Livermore National Lab., CA (United States). Nov 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009468. Source: OSTI; NTIS; GPO Dep.

This report covers the production and preliminary testing of fiber optic sensors that contain a discrete array of analyte specific sensors on their distal ends. The development of the chemistries associated with this technology is covered elsewhere.

16450 (DOE/ET/15601–T66) **Diagnostic development and support of MHD test facilities. Technical progress report, April 1992–June 1992.** Shepard, W.S.; Cook, R.L. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. [1995]. 53p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC02-80ET15601. Order Number DE95009822. Source: OSTI; NTIS; GPO Dep.

The Diagnostic Instrumentation and Analysis Laboratory (DIAL) at Mississippi State University (MSU) is developing diagnostic instruments for magnetohydrodynamic (MHD) power train data acquisition and for support of MHD component development test facilities. Microprocessor-controlled optical instruments, initially developed for Heat Recovery/Seed Recovery (HRSR) support, are being refined, and new systems to measure temperatures and gas-seed-slag stream characteristics are being developed. To further data acquisition and analysis capabilities, the diagnostic systems are being interfaced with DIAL's computers. Technical support for the diagnostic needs of the national MHD research effort is being provided. DIAL personnel also cooperate with government agencies and private industries to improve the transformation of research and development results into processes, products and services applicable to their needs.

16451 Sonication standard laboratory module. Beugelsdijk, T.; Hollen, R.M.; Erkkila, T.H.; Bronisz, L.E.; Roybal, J.E. To Dept. of Energy. 1993. Filed date 24 Mar 1993. U.S. Patent Application 8-036,581. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009984. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A Standard Laboratory Module for automatically producing a solution of contaminants from a soil sample. A sonication tip agitates a solution containing the soil sample in a beaker while a stepper motor rotates the sample. An aspirator tube, connected to a vacuum, draws the upper layer of solution from the beaker through a filter and into another beaker. This beaker can thereafter be removed for analysis of the solution.

16452 (SAND–95-0389) **Folded Compact Range Development and Coherent Change Detection Measurement Project.** Sorensen, K.W. Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009082. Source: OSTI; NTIS; GPO Dep.

A novel, folded compact range configuration has been developed at the Sandia National Laboratories compact range antenna and radar cross section measurement facility, operated by the Radar/Antenna Department 2343, as a means of performing indoor, environmentally-controlled, far-field simulations of synthetic aperture radar (SAR) coherent change detection (CCD) measurements. This report describes the development of the folded compact range configuration, as well as the initial set of coherent change detection measurements made with the system. These measurements have been highly successful, and have demonstrated the viability of the folded compact range concept in simulating SAR CCD measurements. It is felt that follow-on measurements have the potential of contributing significantly to the body of knowledge available to the scientific community involved in CCD image generation and processing, and that this tool will be a significant aid in the research and development of change detection methodologies.

16453 (UCRL-JC–119292) **High-resolution superconducting x-ray spectrometers with aluminum trapping layers of different thicknesses.** Mears, C.A. (Lawrence Livermore National Lab., CA (United States)); Labov, S.E.; Miller, L.H.; Frank, M.; Netel, H.; Azgui, F.; Barfknecht, A.T. Lawrence Livermore National Lab., CA (United States). Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract NAS5-38013; Grant NAGW-3907. (CONF-941013–35: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95010253. Source: OSTI; NTIS; GPO Dep.

Superconducting tunnel junctions coupled to superconducting absorbers may be used as high-resolution, high-efficiency x-ray spectrometers. We have tested devices with niobium x-ray absorbing layers coupled to aluminum layers that serve as quasiparticle traps. We present a study of device performance as a function of thickness of the trapping layers. We measured the best energy resolution using a device with a high-quality barrier and 200 nm-thick trapping layers on both sides of the tunnel barrier. This energy resolution was 36 eV full width at half maximum at 6 keV, about 4 times better than that obtainable using semiconductor ionization detectors.

16454 (ANL/ESD/TM–85) **Interim progress report addendun - environmental geophysics: Building E5032 decommissioning, Aberdeen Proving Ground, January 1994 resurvey.** Thompson, M.D.; McGinnis, L.D.; Benson, M.A.; Borden, H.M.; Padar, C.A. Argonne National Lab., IL (United States). Dec 1994. 20p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95009318. Source: OSTI; NTIS; GPO Dep.

Geophysical surveying around Building E5032 using three new continuously recording geophysical instruments - two types of electromagnetic induction instruments and a cesium vapor magnetometer that were unavailable at the time of the original survey - has provided additional information for defining the location of buried debris, vaults, tanks, and the drainage/sump system near the building. The dominant geophysical signature around Building E5032 consists of a complex pattern of linear magnetic, electrical-conductivity, and electromagnetic field anomalies that appear to be associated with drainage/sewer systems, ditches, past railway activity, the location for Building T5033 (old number 99A), and the probable location of Building 91. Integrated analysis of data acquired using the three techniques, plus a review of the existing ground-penetrating-radar data, allow a more thorough definition of the sources for the observed anomalies.

16455 (FASAC-TAR–95009045) **Non-US electrodynamic launchers research and development.** Parker, J.V.; Batteh, J.H.; Greig, J.R.; Keefer, D.; McNab, I.R.; Zabar, Z. Science Applications International Corp., McLean, VA (United States). Foreign Applied Sciences Assessment Center. Nov 1994. 306p. Source: OSTI; OSTI; Science Applications International Corp., 1710 Goodridge Drive, P.O. Box 1303, McLean, VA 22102.

Electrodynamic launcher research and development work of scientists outside the United States is analyzed and assessed by six internationally recognized US experts in the field of electromagnetic and electrothermal launchers. The assessment covers five broad technology areas: (1) Experimental railguns; (2) Railgun theory and design; (3) Induction launchers; (4) Electrothermal guns; (5) Energy storage and power supplies. The overall conclusion is that non-US work on electrodynamic launchers is maturing rapidly after a relatively late start in many countries. No foreign program challenges the US efforts in scope, but it is evident that the United States may be surpassed in some technologies within the next few years. Until recently, published Russian work focused on hypervelocity for research purposes. Within the last two years, large facilities have been described where military-oriented development has been underway since the mid-1980s. Financial support for these large facilities appears to have collapsed, leaving no effective effort to develop practical launchers for military or civilian applications. Electrodynamic launcher research in Europe is making rapid progress by focusing on a single application, tactical launchers for the military. Four major laboratories, in Britain, France, Germany, and the Netherlands, are working on this problem. Though narrower in scope than the US effort, the European work enjoys a continuity of support that has accelerated its progress. The next decade will see the deployment of electrodynamic launcher technology, probably in the form of an electrothermal-chemical upgrade for an existing gun system. The time scale for deployment of electromagnetic launchers is entirely dependent on the level of research-and-development effort. If resources remain limited, the advantage will lie with cooperative efforts that have reasonably stable funding such as the present French-German program.

16456 (LA-UR–95-176) **Assay of potentially contaminated propellant.** Koster, J.E. (Los Alamos National Lab., NM (United States)); Williams, H.E. III; Scott, W.S. Los Alamos National Lab.,

NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950216–114: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006330. Source: OSTI; NTIS; GPO Dep.

One of the decontamination and decommissioning projects within DOD is demilitarization of an aging stockpile of munitions. A large portion of the stockpile contains depleted uranium (DU) as an armor piercing core and so these munitions must be assayed for the presence of uranium in other components. The assay method must be fast and preferably easy to implement. Presence of DU is indicated by its alpha decay. The alpha particles in turn produce ions in the ambient air. If a significant fraction of these ions can escape the quantity of propellant, the ions can be detected instead of the alpha particles. As a test of the feasibility of detecting alpha emissions from DU somewhere within a cartridge of propellant, the transmission of ions through layers of real propellant was measured. The propellant is in the form of graphite-coated cylindrical pellets. A 105nun cartridge was modified for use as a pellet chamber. A check source served as an ion source. The ion detector consisted of a grid held at 300V coupled to an ammeter. Results confirm that this is a promising technique for testing the propellant for the presence of DU quickly yet with sensitivity.

16457 (SAND–94-2373C) **Storage life of parachutes – long time material degradation.** Ericksen, R.H.; Whinery, L.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950550–1: 13. aerodynamics decelerator systems technology conference, Clearwater, FL (United States), 15-19 May 1995). Order Number DE95009576. Source: OSTI; NTIS; GPO Dep.

This study considers the long-time storage of single-use nylon and Kevlar® parachutes. The authors present data from a 29-year-old nylon parachute, and nylon and Kevlar® test samples stored 14 years under ambient conditions in the absence of sunlight. They compare the results with existing predictions of parachute material degradation and other aging data. X-ray photoelectron spectroscopy analyses were preformed on Nylon and Kevlar® fabrics that were degraded by elevated temperature aging. The results suggest that this technique should be further examined as a "non-destructive" method of detecting degradation.

16458 (SAND–95-0438C) **Advanced product realization through model-based design and virtual prototyping.** Andreas, R.D. (Sandia National Labs., Albuquerque, NM (United States). Electronic Subsystems Center). Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States);American Society of Mechanical Engineers, New York, NY (United States). DOE Contract AC04-94AL85000. (CONF-9503112–1: Agile Manufacturing conference (AMC '95), Albuquerque, NM (United States), 16-17 Mar 1995). Order Number DE95008544. Source: OSTI; NTIS; GPO Dep.

Several government agencies and industrial sectors have recognized the need for, and payoff of, investing in the methodologies and associated technologies for improving the product realization process. Within the defense community as well as commercial industry, there are three major needs. First, they must reduce the cost of military products, of related manufacturing processes, and of the enterprises that have to be maintained. Second, they must reduce the time required to realize products while still applying the latest technologies. Finally, they must improve the predictability of process attributes, product performance, cost, schedule and quality. They must continue to advance technology, quickly incorporate their innovations in new products and in processes to produce them, and they need to capitalize on the raw computational power and communications bandwidth that continues to become available at decreasing cost. Sandia National Laboratories initiative is pursuing several interrelated, key concepts and technologies in order to enable such product realization process improvements: model-based design; intelligent manufacturing processes; rapid virtual and physical prototyping; and agile people/enterprises. While progress in each of these areas is necessary, this paper only addresses a portion of the overall initiative. First a vision of a desired future capability in model-based design and virtual prototyping is presented. This is followed by a discussion of two specific activities parametric design analysis of Synthetic Aperture Radars (SARs) and virtual prototyping of miniaturized high-density electronics – that exemplify the vision as well as provide a status report on relevant work in progress.

16459 (UCRL-ID–118619) **Transfer of Air Force technical procurement bid set data to small businesses, using CALS and EDI: Test report.** Lawrence Livermore National Lab., CA (United States). 15 Aug 1994. 541p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (AITI–93-ED-01). Order Number DE95009610. Source: OSTI; NTIS; GPO Dep.

This report documents a test transfer of three Air Force technical procurement bid sets to one large and twelve small businesses, using the Department of Defense (DoD) Continuous Acquisition and Life-cycle Support (CALS) and ANSI ASC X12 Electronic Data Interchange (EDI) standards. The main goal of the test was to evaluate the effectiveness of using CALS technical data within the context of the DoD's EDI-based standard approach to electronic commerce in procurement, with particular emphasis on receipt and use of the data by small contractors. Air Force procurement data was provided by the Sacramento Air Logistics Center at McClellan Air Force Base; the manufacturing participants were selected from among McClellan's "Blue Ribbon" contractors, located throughout the US. The test was sponsored by the Air Force CALS Test Network, headquartered at Wright-Patterson Air Force Base. The test successfully demonstrated the technical feasibility of including CALS MIL-R-28002 (Raster) engineering data in an EDI Specification/Technical Information transaction set (ANSI ASC X12 841) when issuing electronic requests for quotation to small businesses. In many cases, the data was complete enough for the contractor participant to feel comfortable generating a quote. Lessons learned from the test are being fed back to the CALS and EDI standards organizations, and to future implementors of CALS-EDI based acquisition or contracting systems, which require the transfer of technical information, such as engineering data, manufacturing process data, quality test data, and other product or process data, in the form of a CALS or other digital datafile.

4501 Chemical Explosions and Explosives

16460 (LA-UR–95-841) **Biomorphic robots as a persistent means for removing explosive mines.** Tilden, M.W. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505197–1: Autonomous vehicles in mine countermeasures symposium, Monterey, CA (United States), 5 May 1995). Order Number DE95009433. Source: OSTI; NTIS; GPO Dep.

The current variety and dispersion of explosive mines is a daunting technological problem for current sensory techniques. The bottom line is that the only way to insure a mine has been found and removed is to step on it. As this is an upsetting proposition for biological organisms like animals or children, this paper details a proposed non-biological method that may have validity following additional research into the new science of Biomorphic Machines. A Robobiologist at LANL has invented and developed a variety of "living" robots that are solar powered, legged, autonomous, adaptive to massive damage and terrain, and very inexpensive. This technology, called Nervous Net (Nv) design, allows for the creation of capable walking mechanisms (known as "Biomorphic Robots") which rather than run on a "work" ethic, use "survivalist" design principles. These principles allow Nv based machines to continue doing work even after multiple limbs have been removed or damaged, and to dynamically negotiate complex terrains as an emergent property of their operation. They are not programmed, and indeed, the 12 transistor controller used keeps their electronic cost well below that of most pocket radios. It is suspected that in finding and removing randomly placed explosive mines, they may be an interesting, capable solution.

16461 (LA-UR–95-1074) **Base hydrolysis and hydrothermal processing of PBX-9404 explosive.** Sanchez, J.A.; Flesner, R.L.;

Spontarelli, T.; Dell'Orco, P.C.; Kramer, J.F. Los Alamos National Lab., NM (United States). [1994]. 14p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941255–3: Life cycles of energetic materials, Del Mar, CA (United States), 11-16 Dec 1994). Order Number DE95009497. Source: OSTI; NTIS; GPO Dep.

Base hydrolysis in combination with hydrothermal processing has been proposed as an environmentally acceptable alternative to open burning/open detonation for degradation and destruction of high explosives. In this report, we examine gaseous and aqueous products of base hydrolysis of the HMX-based plastic bonded explosive, PBX-9404. We also examine products from the subsequent hydrothermal treatment of the base hydrolysate. The gases produced from hydrolysis of PBX-9404 are ammonia, nitrous oxide, and nitrogen. Major aqueous products are sodium formate, acetate, nitrate, and nitrite, but not all carbon products have been identified. Hydrothermal processing of base hydrolysate destroyed up to 98% of the organic carbon in solution, and higher destruction efficiencies are possible. Major gas products detected from hydrothermal processing were nitrogen and nitrous oxide.

16462 (LA-UR–95-1107) **Technology assessment of RDX production.** Coburn, M.D. (New Mexico Inst. of Mining and Technology, Socorro, NM (United States)). Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941255–2: Life cycles of energetic materials, Del Mar, CA (United States), 11-16 Dec 1994). Order Number DE95009487. Source: OSTI; NTIS; GPO Dep.

The known processes for producing RDX were assessed with the goal of identifying the process that would generate the least waste and pollution. It was concluded that the Bachman process employed at Holston AAP is the most economical process for producing RDX and that it probably produces less waste than any other process. It was generally agreed that the entire Holston operation is a very clean one that complies with all federal and state emission standards. In addition, a number of opportunities in which Holston could reduce their wastes were identified. Preliminary assessments of waste and pollution profiles for alternate materials, with emphasis on dual-use materials, were performed.

16463 Synthesis of 3,3-dinitroazetidine. Hiskey, M.A. To Dept. of Energy. 1993. Filed date 29 Mar 1993. U.S. Patent Application 8-037,873. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009985. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The compound, 3,3-dinitroazetidine, and a process of preparing 3,3-dinitroazetidine including reacting a mixture of 1-tertiary-butyl-3,3-dinitroazetidine and benzyl chloroformate to form 1-(benzyloxycarbonyl)-3,3dinitroazetidine, reacting the 1-(benzyloxycarbonyl)-3,3dinitroazetidine and trifluoromethanesulfonic acid to form 3,3-dinitroazetidinium trifluoromethanesulfonate, and neutralizing the 3,3-dinitroazetidinium trifluoromethanesulfonate with a base to form 3,3dinitroazetidine are provided. Salts of the 3,3dinitroazetidine and preparation of such salts are also disclosed.

16464 (SAND–95-0311) **On the feasibility of using smoothed particle hydrodynamics for underwater explosion calculations.** Swegle, J.W.; Attaway, S.W. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95008799. Source: OSTI; NTIS; GPO Dep.

SPH (Smoothed Particle Hydrodynamics) is a gridless Lagrangian technique which is appealing as a possible alternative to numerical techniques currently used to analyze high deformation impulsive loading events. In the present study, the SPH algorithm has been subjected to detailed testing and analysis to determine the feasibility of using PRONTO/SPH for the analysis of various types of underwater explosion problems involving fluid-structure and shock-structure interactions. Of particular interest are effects of bubble formation and collapse and the permanent deformation of thin walled structures due to these loadings. These are exceptionally difficult problems to model. Past attempts with various types of codes have not been satisfactory. Coupling SPH into the finite element code PRONTO represents a new approach to the problem. Results show that the method is well-suited for transmission of loads from underwater explosions to nearby structures, but the calculation of late time effects due to acceleration of gravity and bubble buoyancy will require additional development, and possibly coupling with implicit or incompressible methods.

16465 (UCRL-ID–119432) **Empirical validation of the conceptual design of the LLNL 60-kg contained-firing facility.** Pastrnak, J.W.; Baker, C.F.; Simmons, L.F. Lawrence Livermore National Lab., CA (United States). 24 Feb 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009459. Source: OSTI; NTIS; GPO Dep.

In anticipation of increasingly stringent environmental regulations, Lawrence Livermore National Laboratory (LLNL) is proposing to modify an existing facility to add a 60-kg firing chamber and related support areas. This modification will provide blast-effects containment for most of its open-air, high-explosive, firing operations. Even though these operations are within current environmental limits, containment of the blast effects and hazardous debris will further drastically reduce emissions to the environment and minimize the hazardous waste generated. The major design consideration of such a chamber is its overall structural dynamic response in terms of its long-term ability to contain all blast effects from repeated internal detonations of high explosives. Another concern is how much other portions of the facility outside the firing chamber must be hardened to ensure personnel protection in the event of an accidental detonation while the chamber door is open. To assess these concerns, a 1/4-scale replica model of the planned contained firing chamber was engineered, constructed, and tested with scaled explosive charges ranging from 25 to 125% of the operational explosives limit of 60 kg. From 16 detonations of high explosives, 880 resulting strains, blast pressures, and temperatures within the model were measured to provide information for the final design.

16466 (UCRL-JC–117774) **Measurements of a 1/4-scale model of a 60-kg explosives firing chamber.** Pastrnak, J.W.; Baker, C.F.; Simmons, L.F. Lawrence Livermore National Lab., CA (United States). 27 Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506168–1: EUROPYRO '95, Tours (France), 5-9 Jun 1995). Order Number DE95009476. Source: OSTI; NTIS; GPO Dep.

In anticipation of increasingly stringent environmental regulations, Lawrence Livermore National Laboratory (LLNL) proposes to construct a 60-kg firing chamber to provide blast-effects containment for, most of its open-air, high-explosive, firing operations. Even though these operations are within current environmental limits, containment of the blast effects and hazardous debris will further drastically reduce emissions to the environment and minimize the generated hazardous waste. The major design consideration of such a chamber is its overall structural dynamic response in terms of long-term containment of all blast effects from repeated internal detonations of high explosives. Another concern is how much other portions of the facility must be hardened to ensure personnel protection in the event of an accidental detonation. To assess these concerns, a 1/4-scale replica model of the planned contained firing chamber was designed, constructed, and tested with scaled explosive charges ranging from 25 to 125% of the operational explosives limit of 60 kg. From 16 detonations of high explosives, 880 resulting strains, blast pressures, and temperatures within the model were measured. Factors of safety for dynamic yield of the firing chamber structure were calculated and compared to the design criterion of totally elastic response. The rectangular, reinforced-concrete chamber model exhibited a lightly damped vibrational response that placed the structure in alternating cycles of tension and compression. During compression, both the reinforcing steel and the concrete remained elastic. During tension, the reinforcing steel remained elastic, but the concrete elastic limit was exceeded in two areas, the center spans of the ceiling and the north wall, where elastic safety factors as low as 0.66 were obtained, thus indicating that the concrete would be expected to crack in those areas. Indeed, visual post-test inspection of those areas revealed tight cracks in the concrete.

16467 (UCRL-JC–118313) **Measurements of a 1/4-scale model of an explosives firing chamber.** Pastrnak, J.W.; Baker, C.F.; Simmons, L.F. Lawrence Livermore National Lab., CA (United States). 27 Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504133–1: 7. international symposium on interactions of the effects of munitions with structures, Mannheim (Germany), 24-28 Apr 1995). Order Number DE95009478. Source: OSTI; NTIS; GPO Dep.

In anticipation of increasingly stringent environmental regulations, Lawrence Livermore National Laboratory (LLNL) proposes to construct a 60-kg firing chamber to provide blast-effects containment for most of its open-air, high-explosive, firing operations. Even though these operations are within current environmental limits, containment of the blast effects and hazardous debris will further drastically reduce emissions to the environment and minimize the generated hazardous waste. The major design consideration of such a chamber is its overall structural dynamic response in terms of long-term containment of all blast effects from repeated internal detonations of high explosives. Another concern is how much other portions of the facility outside the firing chamber must be hardened to ensure personnel protection in the event of an accidental detonation while the chamber door is open. To assess these concerns, a 1/4-scale replica model of the planned contained firing chamber was designed, constructed, and tested with scaled explosive charges ranging from 25 to 125% of the operational explosives limit of 60 kg. From 16 detonations of high explosives, 880 resulting strains, blast pressures, and temperatures within the model were measured to provide information for the final design. Factors of safety for dynamic yield of the firing chamber structure were calculated and compared to the design criterion of totally elastic response. The rectangular, reinforced-concrete chamber model exhibited a lightly damped vibrational response that placed the structure in alternating cycles of tension and compression. During compression, both the reinforcing steel and the concrete remained elastic.

16468 (UCRL-JC–118375) **Experiments and computer simulations of the dynamic cavity formed by a particulated shaped-charge jet in sand.** Simonson, S.C.; Winer, K.A.; Reaugh, J.E.; Breithaupt, R.D.; Baum, D.W. Lawrence Livermore National Lab., CA (United States). 28 Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950537–4: 15. international symposium on ballistics, Haifa (Israel), 21-24 May 1995). Order Number DE95009562. Source: OSTI; NTIS; GPO Dep.

Experiments have been carried out to measure the dynamic cavity growth of dry sand during penetration by particulated jets from Viper 65-mm-diameter, Cu-lined conical shaped charges at 1,000-mm standoff. The sand target was instrumented with foil switches, piezoelectric pins, and pressure transducers. Flash radiography at 450-keV was used to characterize the jets before impact and to image the target hole during jet penetration. The authors have developed a dry sand equation of state based on existing Hugoniot data as input to a porous material model incorporated in the 2-D arbitrary Lagrangian-Eulerian hydrocode CALE. They have carried out sand penetration simulations in which the particulated jet is modeled as hot copper rods. By varying parameters in the sand and copper descriptions they identify those features that affect the dynamic cavity formation.

16469 (UCRL-JC–118383) **High-speed, high-resolution observations of shaped-charge jets undergoing particulation.** Winer, K.; Breithaupt, D.; Shaw, L.; Muelder, S.; Baum, D. Lawrence Livermore National Lab., CA (United States). 28 Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950537–3: 15. international symposium on ballistics, Haifa (Israel), 21-24 May 1995). Order Number DE95009564. Source: OSTI; NTIS; GPO Dep.

Image-converter (IC) camera photography has provided spectacular images and quantitative records of liner collapse and early jet formation in shaped charges. We have extended the application of the IC camera to observations of shaped charge jet surfaces undergoing particulation. Sequential, high-resolution photographs were taken following the same 10-cm portion of jet at 2.5-μs intervals. Simultaneous color rotating-mirror framing camera photographs and 450-keV flash x-ray radiographs were also taken of the same region. This combination provides a detailed record of the evolution of surface structure during jet necking and particulation. In the high-resolution photographs, individual features on the jet surfaces as small as ~100 μm can easily be detected and followed as they evolve over time. The jet surface structure is rough with overlapping slip dislocation lines running along the surface at 45° to either side of the jet axis. This is similar to the texture that develops in long rods undergoing static tension. We discuss the implications of these images for increasing jet particulation times.

16470 (SAND–94-2294C) **Application of fuzzy technology to risk-based design and decision problems.** Senglaub, M.E. (Sandia National Labs., Albuquerque, NM (United States)); Bahill, A.T. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950740–11: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95006815. Source: OSTI; NTIS; GPO Dep.

A study was undertaken to assess the impact of employing fuzzy technologies in areas of complex weapon system design. The technology was examined for use in a life-cycle cost exercise with the objective of providing a foundation from which to make service life assessments and recommendations on future weapon systems. The issues associated with this problem can be highly subjective and often exhibit a high degree of functional as well as variable uncertainty, ambiguity and noise. The study demonstrated that there is a potential role for the technology, but only in a hybridized environment not as a stand-alone solution methodology.

16471 (SAND–94-2514C) **The dynamic response of a weapon's internal components to a high speed impact.** Gruda, J.D. Sandia National Labs., Albuquerque, NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950740–10: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95006816. Source: OSTI; NTIS; GPO Dep.

The dynamic response of a weapon's internal components to an accident is critical in determining the safety of a weapon. The primary objective of this study was to determine the safety of the weapon based on the acceleration histories of its safety components. The accident scenario was a 80 feet/second impact of the weapon onto a railroad rail. Large deformations and many contacts were expected due to the severity of the impact condition. The complexity of this analysis required a nonlinear finite element code which could track many contact surfaces simultaneously and simulate material failure using element death. The damage to the structure and its contents was simulated using PRONTO3D (an explicit finite element code developed at Sandia National Laboratories). Some of PRONTO3D's advanced features used in the calculations included the self-contacting algorithms, material death, and rigid body mechanics. Throughout the analysis, a large number of mechanical contacts, both normal and sliding with friction, were detected and tracked by PRONT03D. The analysis predicted large deformations and material failure that took the form of tears in the aluminum shroud and in the housing of the components. The predicted acceleration histories were then used to determine if the components remained functional.

16472 (SAND–94-2891C) **Risk assessment methodologies for nuclear weapons compared to risk assessment methodologies for nuclear reactors.** Benjamin, A.S. (Sandia National Labs., Albuquerque, NM (United States). Special Risk Assessment Projects Dept.). Sandia National Labs.. Albuquerque, NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950740–13: Joint ASME/JSME pressure vessels and piping conference,

Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95007736. Source: OSTI; NTIS; GPO Dep.

There are major differences between the safety principles for nuclear weapons and for nuclear reactors. For example, a principal concern for nuclear weapons is to prevent electrical energy from reaching the nuclear package during accidents produced by crashes, fires, and other hazards, whereas the foremost concern for nuclear reactors is to maintain coolant around the core in the event of certain system failures. Not surprisingly, new methods have had to be developed to assess the risk from nuclear weapons. These include fault tree transformations that accommodate time dependencies, thermal and structural analysis techniques that are fast and unconditionally stable, and Monte-Carlo-based sampling methods that incorporate intelligent searching. This paper provides an overview of the new methods for nuclear weapons, compares them with existing methods for nuclear reactors, identifies some of their dual-use characteristics, and discusses ongoing developmental activities.

16473 (UCRL-ID–119429) **Executive summary of NWET applications for NIF workshop.** Simonson, G. (Lawrence Livermore National Lab., CA (United States)); Rosenkilde, C. (eds.); Beezhold, W.; Hebert, P.; Hoover, T.; Kennedy, T.; Knowles, C.; Simonson, G.; Tobin, M. Lawrence Livermore National Lab., CA (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010409. Source: OSTI; NTIS; GPO Dep.

A workshop on nuclear weapon effects test (NWET) applications for the proposed National Ignition Facility (NIF) was convened on March 15, 1994 and continued through March 17, at the Lawrence Livermore National Laboratory, Livermore, California. After an introductory overview that discusses the National ICF Program, lessons learned from South Africa, and the NIF Proposal, this report describes: the various potential environments the NIF is expected to produce, spanning the full range of x-ray energies, plus neutrons, debris, and some mention of gammas; the potential needs for NWET as foreseen for the future, beyond the year 2000, including considerations of potential robust designs and hardness uncertainties; and options for the final facilitization of NIEF for NWET, outlining some of the practical issues that must be considered early in the design process, and showing the levels of capability that could be achieved corresponding to three plausible levels of investment specifically for NWET.

4503 Nuclear Explosion Detection

16474 (LA-UR–95-1072) **Space-based RF signal classification using adaptive wavelet features.** Caffrey, M.; Briles, S. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9504137–1: SPIE: aero sense conference, San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95009499. Source: OSTI; NTIS; GPO Dep.

RF signals are dispersed in frequency as they propagate through the ionosphere. For wide-band signals, this results in nonlinearly-chirped-frequency, transient signals in the VHF portion of the spectrum. This ionospheric dispersion provide a means of discriminating wide-band transients from other signals (e.g., continuous-wave carriers, burst communications, chirped-radar signals, etc.). The transient nature of these dispersed signals makes them candidates for wavelet feature selection. Rather than choosing a wavelet ad hoc, we adaptively compute an optimal mother wavelet via a neural network. Gaussian weighted, linear frequency modulate (GLFM) wavelets are linearly combined by the network to generate our application specific mother wavelet, which is optimized for its capacity to select features that discriminate between the dispersed signals and clutter (e.g., multiple continuous-wave carriers), not for its ability to represent the dispersed signal. The resulting mother wavelet is then used to extract features for a neutral network classifier. The performance of the adaptive wavelet classifier is the compared to an FFT based neural network classifier.

16475 (PNL-SA–25481) **Airborne radionuclides of concern and their measurement in monitoring a Comprehensive Test Ban Treaty.** Perkins, R.W.; Miley, H.S.; Hensley, W.K.; Abel, K.H. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950151–4: NATO (ASI)/monitoring a comprehensive test ban treaty, Algrave (Portugal), 23 Jan - 2 feb 1995). Order Number DE95007811. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) is conducting radioanalytical developmental programs with the goal of providing near-real-time analysis technology for airborne signature radionuclides which are indicative of a nuclear weapons test in any of the earth's environments. If a test were conducted in the atmosphere or above the atmosphere, then the full spectrum of fission and activation products, together with residues from the device would be dispersed in the atmosphere. However, if a nuclear test were conducted underground or under water, the emission could range from a major to a very minor vent, and the material released would likely consist mainly of noble gas radionuclides and the radioiodines. Since many of the noble gases decay to form particulate radionuclides, these may serve as the more sensitive signatures. For example, Ba-140 is a daughter of Xe-140 (13.6 s), and Cs-137 is a daughter of Xe-137 (3.82 min). Both of these have been observed in large amounts relative to other fission products in dynamic venting of U.S. underground nuclear detonations. Large amounts of radionuclides are produced from even a comparatively small nuclear detonation. For example, a 10-KT fission device will produce approximately a megacurie of Ba-140 and of several other radionuclides with half-lives of days to weeks. If such a device were detonated in the atmosphere at midlatitude, it would easily be observable at downwind monitoring sites during its first and subsequent circumnavigations of the earth. Efficient and practical methods for the near-real-time analysis of both particulate and gaseous radionuclides are important to an effective monitoring and attribution program in support of a Comprehensive Test Ban Treaty (CTBT); methods for this purpose are being pursued.

16476 (UCRL-JC–119102) **Differences in seismic decoupling with chemical and nuclear explosives.** Glenn, L.A. Lawrence Livermore National Lab., CA (United States). Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950182–2: 2. Defense Nuclear Agency/Arms Control and Disarmanent Agency (DNA/ACDA) veritech symposium, Washington, DC (United States), 10-12 Jan 1995). Order Number DE95009872. Source: OSTI; NTIS; GPO Dep.

An extensive series of simulations was performed of underground explosions in salt, using both chemical and nuclear explosives. In both cases, the radius of the initial emplacement cavity was varied from the fully tamped configuration to as large as 80 $m/kt^{1/3}$; when not fully tamped, the cavity was assumed initially to contain air at ambient temperature and pressure. In the nuclear source case, the simulations are shown to be in good agreement with the SALMON/STERLING events conducted by the U.S., and with recently released Russian data on a similar pair of explosions in an Azgir salt dome. Simulation of the U.S. COWBOY series of chemical explosions in a Louisiana salt mine are also shown to be in very good agreement with the experimental data, however the constitutive model for the salt that best explains these data is different from that derived for SALMON; both salt models are amply supported by laboratory and field data. The main result of these simulations is that cavity decoupling with chemical explosives is much less efficient than with nuclear explosives. Although maximum decoupling factors, f_{max}, near 200 may be attainable with either of the two sources, the cavity size required to achieve this value appears to be > 40 $m/kt^{1/3}$. For cavity radii half as large, f_{max} is roughly 4 times lower with nuclear explosives, and lower by another factor of 4 with chemical sources. Moreover, if the initial cavity radius is a more modest 10 $m/kt^{1/3}$, $f_{max} < 3$ even with a nuclear source.

16477 (UCRL-JC–119103) **KUCHEN: An experiment to evaluate decoupling in high-aspect-ratio cavities.** Glenn, L.A.; Heinle, R.A.; Moran, B.; Rambo, J.; Roth, B.G. Lawrence Livermore National Lab., CA (United States). Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950182–1: 2. Defense Nuclear Agency/Arms

Control and Disarmanent Agency (DNA/ACDA) veritech symposium, Washington, DC (United States), 10-12 Jan 1995). Order Number DE95009873. Source: OSTI; NTIS; GPO Dep.

It has been argued that even if cavity-decoupled nuclear explosions are a theoretical evasion scenario, the size of the cavity required may be so large as to preclude their use, except possibly in salt. For example, to obtain a decoupling factor of 50 or more would require a cavity radius of at least 20 m/kt. Various theoretical studies have shown, however, that spherical cavities may not be necessary, and that ratios of length-to-span of 10-20 might be used without significant loss of decoupling capability so long as the volume is maintained. This means, for example, that if a tunnel with cylindrical cross section were employed to decouple a 1 kt explosion, the tunnel radius would decrease from 20 m to 8.1 m with an aspect (length-to-diameter) ratio of 10 and to 6.4 m with an aspect ratio of 20. At NTS, we intend to take advantage of the readiness effort activities and funding to perform mid-scale chemical-explosion decoupling experiments in an event called KUCHEN that is scheduled for the spring of 1995. We have identified an 8 ft-diameter hole, 3 50 ft deep in area 9 (U9cu) that is available for these experiments. Our plan is to conduct two tamped shots and at least one decoupling shot in this hole. The explosive charge will be on the order of 50 kg and the aspect ratio will be in the range 10-15. Details of the proposed experiments are discussed.

4505 Strategic Defense Initiative

16478 (SAND–95-0342) **Glass bead size and morphology characteristics in support of Crystal Mist field experiments.** Einfeld, W. (Sandia National Labs., Albuquerque, NM (United States). Environmental Characterization Dept.). Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009118. Source: OSTI; NTIS; GPO Dep.

One of the tasks of the Lethality Group within US Army Space and Strategic Defense Command (USASSDC) is the development of a capability to simulate various missile intercept scenarios using computer codes. Currently under development within USASSDC and its various contractor organizations is a group of codes collected under a master code called PEGEM for Post Event Ground Effects Model. Among the various components of the code are modules which are used to predict atmospheric dispersion and transport of particles or droplets following release at the altitude specified in the missile intercept scenario. The atmospheric transport code takes into account various source term data from the intercept such as: initial cloud size; droplet or particle size distribution; and, total mass of agent released. An ongoing USASSDC experimental program termed Crystal Mist involved release of precision glass beads under various altitude and meteorological conditions to assist in validation and refinement of various codes that are components of PEGEM used to predict particle atmospheric transport and diffusion following a missile intercept. Here, soda-lime glass beads used in the Crystal Mist series of atmospheric transport and diffusion tests were characterized by scanning electron microscopy and automated image processing routines in order to fully define their size distributions and morphology. Four bead size classifications ranging from a median count diameter of 45 to 200 micrometers were found to be approximately spherical and to fall within the supplier's sizing specifications. Log-normal functions fit to the measured size distributions resulted in geometric standard deviations ranging from 1.08 to 1.12, thereby fulfilling the field trial requirements for a relatively narrow bead size distribution.

4506 Chemical and Biological

16479 (UCRL-JC–118760) **The Cooperative On-site Sampling and Analysis Experiment (COSAX).** McGuire, R.R. (Lawrence Livermore National Lab., CA (United States). Arms Control and Treaty Verification Program); Trethewey, A.; Simak, R.S. Lawrence Livermore National Lab., CA (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950163–3: 3. international on-site analysis conference, Houston, TX (United States), 22-25 Jan 1995). Order Number DE95009878. Source: OSTI; NTIS; GPO Dep.

The Chemical Weapons Convention (CWC) expresses a preference for the analysis of samples at the site of the inspection during which they were collected. In order to accomplish this effectively a highly portable laboratory kit must be assembled in modular form to be transported to the inspection site. This kit must allow for the collection of samples, the preparation of samples for analysis and, finally, the analysis of the collected samples. The US Army Research, Development and Engineering Center (ERDEC) and the Lawrence Livermore National Laboratory (LLNL) under US Department of Energy funding have, largely through independent but coordinated programs, assembled such a laboratory kit. ERDEC and LLNL have joined with the UK Chemical and Biological Defence Establishment (CBDE) to evaluate and demonstrate the capability of the portable laboratory kit. The exercise, called the Cooperative, On-site Sampling and Analysis Experiment (COSAX) took place from 11 to 15 April, 1994, at the CBDE, Porton Down, UK. The paper describes the experimental plan, discusses, the results, and summarizes the findings.

16480 (NEI-DK–1954) **National Environmental Research Institute R and D projects 1995.** Christensen, H. (ed.). Danmarks Miljoeundersoegelser, Roskilde (Denmark). Feb 1995. 136p. Order Number DE95772353. Source: OSTI; NTIS.

The publication provides detailed information on current research activities of The National Environmental Research Institute (NERI. Denmark). It supports NERI's policy of increased cooperation in this field of research. NERI's research and development projects are presented in the wider contexts of its current areas of research. Definitions and aims are given in a short introduction to each area. Project descriptions include the title of the project, the names of the project coordinator and other involved scientists and information on the amount of time spent on the project by personnel. Collaborating institutions are named as well as sponsoring agencies and foundations. Descriptions are also given of the general background, objectives and methods employed. Current subjects of research range under the headings of systems analysis, microbiology, ecotoxology, environmental and analytical chemistry, atmospheric research, arable land ecology, uncultivated areas and woodlands, streams and catchment areas, lake ecology, estuarine ecology, marine ecology, population ecology, transport and the environment and environmental data. Information is also given on the nature and organization of NERI. (AB)

16481 (BARC–1994/E/021) **Studies on the diffusional and electrical transport of the daughter aerosols of radon and thoron in moving gases.** Mayya, Y.S. (Bhabha Atomic Research Centre, Bombay (India). Enviornmental Assessment Div.); Sahni, D.C. Bhabha Atomic Research Centre, Bombay (India). 1994. 200p. Order Number DE95627770. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents a detailed theoretical study of the transport characteristics of the daughter products of radon and thoron gases in channel flow devices. Specific aspects examined include: (i) development of the Green's function of the convective-diffusion operator and its boundary layer forms with and without axial diffusion, (ii) transport probabilities of recoil atoms (RaB) emitted into stagnant and moving gases, due to alpha decays of the parent atoms (RaA) deposited on surfaces, (iii) a comprehensive theory of double filter systems and (iv) microscopic theory of particle transport in

moving fluids based on the Fokker-Planck equation. Both uniform and parabolic velocity profiles are considered. Various applications of the solutions in interpreting the measured data are presented. Chief among them is the application of the advanced theory of double-filter systems employed in Trombay studies for the measurements of thoron in the exhaled breath of thorium workers. 16482 (CONF-940277–) **Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.** USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. 373p. Sponsored by USDOE, Washington, DC (United States). From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

This document contains the summaries of papers presented at the 1994 Atmospheric Radiation Measurement (ARM) Science Team meeting held in Charleston, South Carolina. To put these papers in context, it is useful to consider the history and status of the ARM Program at the time of the meeting. The history of the project has several themes. First, the Program has from its very beginning attempted to respond to most critical scientific issues facing the United States Global Change Research Program. Second, the Program has been strongly coupled to other agency and international programs. The Program reflects an unprecedented collaboration among the various elements of the national research community, including a significant level of cooperation among the U.S. Department of Energy's (DOE) national laboratories. Next, ARM has always attempted to make the most judicious use of its resources by collaborating and leveraging existing assets and has managed to maintain an aggressive schedule despite budgets that have been much smaller than planned. Finally, the Program has attracted some of the very best scientific talent in the climate research community and has, as a result, been very productive scientifically. This introduction covers the first three points-the papers themselves speak to the last point. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

16483 (CONF-9410327–1) **Field performance of the Walker Branch throughfall displacement experiment.** Hanson, P.J. (Oak Ridge National Lab., TN (United States). Environmental Sciences Div.); Todd, D.E.; Edwards, N.T.; Huston, M.A. Oak Ridge National Lab., TN (United States). 6 Oct 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium o ecosystem manipulation; Bowness-on-Windermere (United Kingdom); 19-21 Oct 1994. Order Number DE95008677. Source: OSTI; NTIS; GPO Dep.

The authors are conducting a large-scale manipulative field experiments in an upland oak forest on the Walker Branch Watershed in eastern Tennessee USA to identify important ecosystem responses that might result from future precipitation changes. The manipulation of soil moisture is being implemented by a gravity-driven transfer of throughfall precipitation from one treatment plot to another. Throughfall is intercepted in ≈ 2,000 subcanopy troughs (0.3 x 5 m) suspended above the forest floor of the dry plots (≈ 33% of the ground area is covered) and transferred by gravity flow across an ambient plot for subsequent distribution onto the wet treatment plot. Percent soil water is being monitored with time domain reflectometers at 310 sampling locations across the site. The experimental system is able to produce statistically significant differences in soil water content in years having both extremely dry and extremely wet conditions. Furthermore, comparisons of pre- and post-installation soil temperature measurements have documented the ability of the experimental design to produce these changes without changing the microclimate of the forest understory.

16484 (CONF-950646–1) **Particulate air pollution and increased mortality: Biological plausibility for causal relationship.** Henderson, R.F. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. From Air and Waste Management Association meeting; San Antonio, TX (United States); 18-23 Jun 1995. Order Number DE95006161. Source: OSTI; NTIS; INIS; GPO Dep.

Recently, a number of epidemiological studies have concluded that ambient particulate exposure is associated with increased mortality and morbidity at PM concentrations well below those previously thought to affect human health. These studies have been conducted in several different geographical locations and have involved a range of populations. While the consistency of the findings and the presence of an apparent concentration response relationship provide a strong argument for causality, epidemiological studies can only conclude this based upon inference from statistical associations. The biological plausibility of a causal relationship between low concentrations of PM and daily mortality and morbidity rates is neither intuitively obvious nor expected based on past experimental studies on the toxicity of inhaled particles. Chronic toxicity from inhaled, poorly soluble particles has been observed based on the slow accumulation of large lung burdens of particles, not on small daily fluctuations in PM levels. Acute toxicity from inhaled particles is associated mainly with acidic particles and is observed at much higher concentrations than those observed in the epidemiology studies reporting an association between PM concentrations and morbidity/mortality. To approach the difficult problem of determining if the association between PM concentrations and daily morbidity and mortality is biologically plausible and causal, one must consider (1) the chemical and physical characteristics of the particles in the inhaled atmospheres, (2) the characteristics of the morbidity/mortality observed and the people who are affected, and (3) potential mechanisms that might link the two.

16485 (CONF-950646–5) **Management of meteorological data at a former nuclear weapons facility.** Dickerman, C.L.; Maxwell, D.R. EG and G Rocky Flats, Inc., Golden, CO (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. From Air and Waste Management Association meeting; San Antonio, TX (United States); 18-23 Jun 1995. Order Number DE95007619. Source: OSTI; NTIS; GPO Dep.

The purposes of the Climatological Data Management and Meteorological Monitoring programs at the Rocky Flats Environmental Technology Site (Site), are to support Emergency Response (ER) programs at the Site for use in assessing the transport, diffusion, and deposition of effluents actually or potentially released into the atmosphere by Site operations, to provide information for on-site and off-site projects concerned with the design of environmental monitoring networks for impact assessments, environmental surveillance activities, and remediation activities. Also, maintenance of a meteorological monitoring network, which includes measuring, archiving, analyzing, interpreting, and summarizing resulting data is required for successfully generating monthly and annual environmental monitoring reports and for providing assistance for on-site and off-site projects. Finally, the Meteorological Monitoring Program provides information for site-specific weather forecasting, which supports Site operations, employee safety, and Emergency Response operations.

16486 (CTH-PUBL–93-8, pp. 2-12) **CFC substitutes; Implications for ozone and climate.** Berntsen, T. (Univ. of Oslo (Norway). Inst. for Geophysics). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

Increased understanding of the physics and chemistry of the atmosphere has lead to strict regulations of the use of chlorofluorocarbons (CFCs). Observations have shown significant ozone depletions on regional and seasonal scales (i.e. the Antarctic ozone hole) which are shown to be caused by anthropogenic emissions of CFCs. Lesser, but still statistically significant, reductions have been observed over large parts of the Northern Hemisphere. The latest observational evidence of large scale ozone depletions are presented. The rapid phase-out of the fully halogenated CFCs inferred by the Montreal Protocol, has lead to increased concern about environmental impacts of intermediate CFC-substitutes like HCFC and HFCs. Tropospheric loadings of total organic chlorine and stratospheric loadings of active chlorine has been calculated by a simple model for different emission scenarios. Total active chlorine

levels in the lower stratosphere (from the substitutes) is shown to reach its maximum before year 2000 when an emission scenario according to the Montreal Protocol has been applied. The direct effect on climate has been estimated by calculating the increased radiative forcing due to the substitutes. 9 refs, 7 figs, 4 tabs

16487 (CTH-PUBL–93-8, pp. 13-17) **"PUR 2000" - Norwegian producers of rigid PUR foam unite in a national research programme in the further development of environmental friendly PUR technology.** Vik, B. (Norwegian Plastic Industry Federation (Norway). Rigid PUR foam group). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

Norwegian rigid PUR-foam industry has been CFC-free for more than 2 years. The most commonly used blowing agents to day belong to the HCFCs, which are to be phased out in course of few years. Through collaboration and common R and D-effort, Norwegian rigid PUR-foam industry has the ambitions to be amongst the environmental leading PUR-companies of the world, and to fulfill the phase out also of HCFCs ahead of UN- and EEC-regulations.

16488 (DEFU-TR–343) **CFC phase-out. Consequences for operation and energy consumption in cooling systems.** Borup Jensen, J.; Lundager, F.; Lykke Jensen, M. Danske Elvaerkers Forenings Udredningsafdeling (DEFU), Lyngby (Denmark); Danske Elvaerkers Forening, Copenhagen (Denmark). Dec 1994. 106p. (In Danish). Order Number DE95772414. Source: OSTI; NTIS.

Because of the threat to the ozone layer, the use of chlorofluorocarbon (CFC) refrigerants are to be gradually phased out during the coming years. Several ways of achieving this are described and this information should be of use to energy consultants, also in relation to energy conservation. A survey of environmental questions based on related international agreements is given. Since January 1st, 1995, it is forbidden to produce CFC refrigerants in Denmark. Thus the emphasis is on suggestions for alternative refrigerants (such as propane, ammonia, carbon dioxide, and butane) their potentials and the necessary changes in cooling system design. Energy, and environmental-related consequences and costs of using other refrigerants are described in addition to the possibilities of obtaining state subsidies in this relation. Concrete examples are given on how to change out cooling systems and/or refrigerants. (AB) (13 refs.)

16489 (DOE/ER/61761–1) **Feasibility of tropospheric water vapor profiling using infrared heterodyne differential absorption lidar.** Grund, C.J. (NOAA Environmental Technology Lab., Boulder, CO (United States)); Hardesty, R.M.; Rye, B.J. Colorado Univ., Boulder, CO (United States). Cooperative Inst. for Research in Environmental Sciences. 3 Apr 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI03-94ER61761. Order Number DE95009647. Source: OSTI; NTIS; GPO Dep.

Continuous, high quality profiles of water vapor, free of systematic bias, and of moderate temporal and spatial resolution, acquired over long periods at low operational and maintenance cost, are fundamental to the success of the ARM CART program. The development and verification of realistic climate model parameterizations for clouds and net radiation balance, and the correction of other CART site sensor observations for interferences due to the presence of water vapor are critically dependent on water vapor profile measurements. Application of profiles acquired with current techniques, have, to date, been limited by vertical resolution and uniqueness of solution [e.g. high resolution infrared (IR) Fourier transform radiometry], poor spatial and temporal coverage and high operating cost (e.g. radiosondes), or diminished daytime performance, lack of eye-safety, and high maintenance cost (e.g. Raman lidar). Recent developments in infrared laser and detector technology make possible compact IR differential absorption lidar (DIAL) systems at eye-safe wavelengths. In the study reported here, we develop DIAL system performance models and examine the potential of to solve some of the shortcomings of previous methods using parameterizations representative of current technologies. These models are also applied to diagnose and evaluate other strengths and weaknesses unique to the DIAL method for this application. This work is to continue in the direction of evaluating yet smaller and lower-cost laser diode-based systems for routine monitoring of the lower altitudes using photon counting detection methods. We regard the present report as interim in nature and will update and extend it as a final report at the end of the term of the contract.

16490 (DOE/NV/11432–173) **USDOE Nevada Operations Office Environmental Monitoring Program summary data report. Third calendar quarter 1994.** Black, S.C.; Glines, W.M.; Townsend, Y.E. (eds.). Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Jan 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-94NV11432. Order Number DE95010670. Source: OSTI; NTIS; INIS; GPO Dep.

The radiological environmental surveillance (air, surface water, supply well water, drinking water) and nonradiological effluent monitoring (drinking water, sewage lagoons, nonhazardous solid waste disposal) activities are reported for Nevada, Nevada Test Site (NTS), Pantex, and fissile nuclear materials storage/disposition. NEPA documentation and environmental occurrences at NTS facilities are listed.

16491 (ETDE-DE–66) **N_2O-emissions from fluidized bed combustion. Investigations about reactions paths and options of minimization. Final report.** Sybon, G.; Leuckel, W. Karlsruhe Univ. (T.H.) (Germany). Engler-Bunte-Institut Bereich 3 - Feuerungstechnik. Aug 1993. 73p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326730A. Order Number DE95768719. Source: OSTI; NTIS (US Sales Only).

A measurement technique using the principle of Fourier transformed infrared was adapted and used for the qualitative and quantitative measuring of N_2O. Investigations about the homogeneous system of FBC have been performed at an existing semi-technical rig and at an laboratory rig, which was built during the project. The influence of technical ashes was also investigated in the laboratory scaled rig. The dependences of the homogeneous N_2O-formation on temperature and stoichiometry have been pointed out; N_2O-formation increases with decreasing temperature and increasing oxygen concentration. The reaction paths of the N_2O-Formation have been valuated. At fuel-lean conditions formation of N_2O is caused by CN-fuel-N-compounds; at fuel-rich conditions the importance of the reaction path via NH-radicals increases. N_2O-destruction is increased with enhanced temperature; the presence of reducing gas species as CO or H_2 enhances this effect. (orig.)

16492 (ETDE-DE–68) **Current emission ratings of furnaces subject to the Clean Air Technical Code in Baden Wuerttemberg.** Landesanstalt fuer Umweltschutz Baden-Wuerttemberg, Karlsruhe (Germany). Aug 1994. 35p. (In German). Order Number DE95768859. Source: OSTI; NTIS (US Sales Only).

The report lists the emissions of furnaces in Baden-Wurttemberg fuelled with heating oil, natural gas and wood. The pollutants CO, SO2, NOx and dust were measured.

16493 (ETDE-DE–69) **NO_x and dioxin abatement by SCR catalysts.** Huettenhofer, K.; Sigling, R.; Spitznagel, G.W. Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Bereich Energieerzeugung. [1994]. 35p. Order Number DE95768733. Source: OSTI; NTIS (US Sales Only).

The report discusses the applications of the process of selective catalytic reduction in off-gas purification for reduction of nitrogen oxides and dioxins/furans. Two different types of catalyst (plates, honeycomb catalysts) and their applications are presented and compared. (SR)

16494 (ETDE-DE–80) **The land-surface climate program. Final report.** Roth, R.; Hoppmann, U. Hannover Univ. (Germany). Inst. fuer Meteorologie und Klimatologie. Dec 1994. 65p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 07KF114. Order Number DE95768531. Source: OSTI; NTIS (US Sales Only).

In the course of LOTREX-10E (longitudinal land-surface traverse experiment 10 E) several experiments along 10 East were planned

in order to obtain sets of climate related surface paramters at different latitudes. The results should be representative for areas in the scale of satellite-pixels or the grid-scale of climate models, respectively. One intention was the validation of satellite data for climate observation, another one the check and correction of actual climate models. For this purpose two interdisciplinary field experiments HIBE'88 and HIBE'89 (Hildesheimer Boerde Experiment) were conducted 1988 and 1989 in Northern Germany near Hannover. In the second part of this paper the principal objective of the experiments and the aims of the participants are presented. (orig.)

16495 (ETDE-DE–89) **Investigation of the stratospheric ozone variation especially in polar regions with a new laser system. Interim report.** Augstein, E. Alfred-Wegener-Institut fuer Polar- und Meeresforschung, Bremerhaven (Germany). 20 May 1988. 8p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT POL0033. Order Number DE95770381. Source: OSTI; NTIS (US Sales Only).

This research project aims at 1. developing and testing a XeCl Eximer laser for the determination of the vertical distribution of the atmospheric ozone concentration by day and at night, 2. recording the variations in space and time of vertical ozone profiles above all in the polar regions. To attain these aims a laser system has been developed which receives also in case of insolation an evaluable stray light signal from which the ozone concentration can be derived. The XeCl laser which is installed in a transportable container was successfully used in May and June 1987 on the FS 'Polarstern' in the Norwegian and Groenland sea. (orig.)

16496 (INIS-BR–3478) **Environmental dosimetry of radon-222 and daughters: measurement of absolute calibration factors of CR-39 considering the plate-out effects and environmental factors.** Paulo, S.R. de. Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica. Aug 1991. 369p. (In Portuguese). Order Number DE95626550. Source: OSTI; NTIS (US Sales Only); INIS.

The subject of this work concerns with the measurement of absolute calibration factors for the use of CR-39 as an absolute detector in indoor and daughters monitoring. Up to now the usefulness of calibration factors was restricted to environmental conditions equal (or very close) to those worthing during their determinations. This fact is consequence of the difficulties related to the understanding of the plate-out properties of radon daughters activity in the air. The plate-out effects on radon daughters monitoring performed by SSNTDs are studied. Our experimental results are in agreement with those of other authors about the great sensitivity of CR-39 to the plate-out effects, fact that recommended its use in this work. Being succeeded in the employment of CR-39 as an alpha-spectrometer we concluded that some important information (like the radon daughters deposition rates on the walls of an environment) can be achieved. The knowledge about the behavior of plate-out made possible the determination of the ranges in zenithal angle and energy where CR-39 can detect alpha-particles with efficiency of 100%, at our conditions of track observation. In this way, we obtained calibration factors for CR-39 that are weakly dependent on environmental conditions. We think that these results can contribute to the improvement of RD (Radiation Detector) detection techniques. (author). 159 refs, 106 figs, 05 tabs.

16497 (INIS-mf–14489) **Ecological aspects of energy efficiency.** Dichev, I.; Shvabski, Kh. National Electricity Co., Sofia (Bulgaria). 1994. 5p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95626675. Source: OSTI; NTIS (US Sales Only); INIS.

An attempt is made to give a quantitative expression of the link between energy efficiency and emissions of atmospheric pollutants. The authors investigate the specific emissions per 1 kWh of SO_2, NO_x, dust and CO_2 produced from different energy sources in 1993 in Bulgaria - TPP (black and brown coal, lignite), HPP and NPP. The emissions are considered as generalized ecological characteristics allowing to make quantitative comparison of different energy sources and to determine the ways of reducing particular absolute emission. As an example for application of this approach the following measures are proposed for reducing SO_2 emissions: (1) cutting the lignite-fired energy production; (2) increase of high-grade-coal-fired energy production; (3) increase of share of HPP and NPP in energy production; (4) increase in efficiency of energy usage by energy saving. The realization of these ways requires large investments in the industry as a whole. 1 tab., 2 figs. (orig.).

16498 (IVL-B–1180) **Validation of an ISO Standard Procedure for determination of SO_2 in flue gases.** Cooper, D. Swedish Environmental Research Inst., Goeteborg (Sweden). Mar 1995. 45p. (In Swedish). Order Number DE95766671. Source: OSTI; NTIS.

A manual reference method for determination of the concentration of SO_2 in emissions is needed parallel to the continuous methods. All available standard procedures build on a superseded method for analysis (the Thorin method). Ion chromatography has become a common method for sulfate analyses in spite of the fact that a formal standard procedure does not exist. SIS has proposed a new program of work for replacing the Thorin method with ion chromatography for a new ISO standard. To that end a project has been started to investigate the performance of the suggested method. Round Robin tests at 15 European laboratories are reported in the present publication. The results show that ion chromatography can replace the Thorin method. A proposal for a new standard document is included. 12 refs, 6 figs, 2 tabs

16499 (IVL-B–1183) **Clover as a bio indicator for ambient ozone in Sweden - a national cooperation project.** Pihl Karlsson, G. (Swedish Environmental Research Inst., Goeteborg (Sweden)); Pleijel, H.; Danielsson, H.; Skaerby, L.; Ericson, L. Swedish Environmental Research Inst., Goeteborg (Sweden). Mar 1995. 33p. (In Swedish). Order Number DE95766672. Source: OSTI; NTIS.

The study was performed in parallel to an international study by UNECE, ICP-Crops.The goal was to find out if the bio-indicator Subterranean Clover (Trifolium Subterraneum) could be cultivated all over Sweden, and to what extent ambient ozone affects this species in Sweden. Results show that Sub. Clover can be cultivated, that the critical concentrations are around 20 ppb for 24 hour exposure and 25 ppb for a 7 hour exposure. Injury potential of 10% arrives at a 24 hour exposure of 25 ppb and a 7 hour exposure of 30 ppb. 8 refs, 22 figs, 9 tabs

16500 (LA–12895-MS) **Chemical and isotopic variations of precipitation in the Los Alamos Region, New Mexico.** Adams, A.I.; Goff, F.; Counce, D. Los Alamos National Lab., NM (United States). Feb 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95008110. Source: OSTI; NTIS; INIS; GPO Dep.

Precipitation collectors were installed at 14 locations on the Pajarito Plateau and surrounding areas to study variations in chemistry, stable isotopes and tritium for the years 1990 to 1993. The volume of precipitation was measured and samples were collected and analyzed every three to four months. All precipitation samples contain <2.50 mg/kg Cl and have pH values ranging from 5.4 to 6.7. The stable isotope ($\delta D/\delta^{18}O$) results record seasonal variations in precipitation as the weather patterns shift from sources in the Pacific Ocean to sources in the Gulf of Mexico. The stable isotope results also show isotopic variations due to elevation differences among the collection points. The tritium contents (^3H) in rain samples vary from 6.54 T.U. to 141 T.U. Contouring of high tritium values (e.g. >20 T.U.) from each collection period clearly shows that Laboratory activities release some tritium to the atmosphere. The effect of these releases are well below the limits set by the Environmental Protection Agency for drinking water (about 6200 T.U.). The magnitude of the releases is apparently greatest during the summer months. However, anomalous tritium values are detected as far north as Espahola, New Mexico for many collection periods. Tritium releases by the Laboratory are not constant; thus, the actual amount of tritium in each release has been diluted in the composite samples of our three to four month collection periods.

16501 (NEI-DK–1880) **Air quality in the streets of Denmark. Calculations related to 34 streets.** Vejplanomraadet, Trafiksikkerhed og Miljoe, 14. Bendtsen, H.; Basse Kristensen, E.; Reiff, L. Vejdirektoraet, Copenhgaen (Denmark). 1994. 91p. (In Danish). Order Number DE95766510. Source: OSTI; NTIS.

A system is proposed for monitoring the air quality in the streets of Danish towns. It is based on calculations specified in the document 'Beregningsmodel for Luftforurening i Bygader' (VTI og Trivector, October 1992) - a model common to the Nordic countries - for the air quality in 34 urban streets in 8 urban areas. The monitoring system is tested on traffic data from the period 1985-1992. Calculations show a drop in levels of CO in all streets (with a more significant decrease on roads and thoroughfares) and a smaller drop in the occurrence of NO_2. One reason for this reduction is reckoned to be a improved engine technology and the introduction of catalytic converters on new cars at the end of the period. On approach roads and thoroughfares traffic has increased, in main streets and urban areas it has remained the same and it is reduced in main streets in central areas. It is recommended that in the streets selected a count should be carried out annually, the proportion of heavy traffic and speed measurements should be registered, a continuous evaluation should be made as to whether patterns of traffic growth on these streets are typical of Danish urban areas and the calculation model should be regularly updated. (AB) (13 refs.)

16502 (NEI-DK–1968) **Environmental Indicators 1994.** Wichmann, H. (ed.) (Skov- og Naturstyrelsen (Denmark)). Miljoe- og Energiministeriet, Copenhagen (Denmark). 1994. 39p. (In Danish). Order Number DE95772393. Source: OSTI; NTIS.

The aim of the report is to make it possible for the individual reader to get an overall picture of the present state of the Danish countryside and of the environment in general. Currently, lead emission has been reduced to almost zero, and the re-use of glass, paper and cardboard is regularly increasing, concentrations of ozone-layer depleting substances and sulphur dioxide emission decreases constantly and the harm previously suffered by some bird species is no longer prevalent. Continuing problems are water pollution (especially by nitrogen and chemicals used in agriculture), the threat to Danish groundwaters, and the fact that there a fewer and fewer birds that frequent arable lands. Danish forests are the main theme of the report. Forests give character to the Danish landscape and the government wishes to extend the forest areas. They are important as public recreation areas and for animal and plant life, Christmas trees can be grown in them, they are a part of the country's cultural history. It is important to make use of the forests, it is stated. Data and other information is also given on urban areas and on air, land and water pollution in Denmark. (AB)

16503 (NIRS-M–98, pp. 1-6) **Current status SPEEDI operation and its tasks.** Fukuyama, Shigeru (Nuclear Safety Technology Center, Tokyo (Japan).). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). (CONF-9312105–: 21. National Institute of Radiological Sciences, Chiba (Japan), 2-3 Dec 1993). In *Dose assessment and approach to the safety for the public in the emergency. Proceedings.* 210p. Order Number DE95747912. Source: OSTI; NTIS; INIS.

The System for Prediction of Environmental Emergency Dose Information called 'SPEEDI' provides realistic estimate of radiation concentration and dose assessment that may result from an atmospheric release of radioactive materials. SPEEDI uses advanced computer-based data processing and data communication system for atmospheric dispersion calculation to derive radiation consequence assessment with the concerned meteorological data and the source term information. SPEEDI has been developed since 1980 by Japan Atomic Energy Research Institute(JAERI), Meteorological Research Institute following to the lessons learned from the accident in 1979 at Three Mile Island, USA. Nuclear Safety Technology Center(NUSTEC) has been constructing a nationwide data communication network that links STA and relevant local governments since 1986. The network now comprises 13 local stations in local governments while the Science and Technology Agency(STA) functions as the command center for SPEEDI in case of emergency. In Japan, the conventional simplified Gaussian plume model has been used for emergency radiation dose estimation however, SPEEDI was recognized as the authorized method for it in Emergency Environmental Radiation Monitoring Criteria and Off-site Emergency Planning and Preparedness for Nuclear Power Plants' in 1992. The role of SPEEDI is now far the more important. Local governments are now conducting nuclear emergency exercises almost every year incorporating the information of SPEEDI in their scenarios. (author).

16504 (NIRS-M–98, pp. 7-16) **Development of 'health and environmental safety assessment network system (HESANS)'.** Nakamura, Yuji (National Inst. of Radiological Sciences, Chiba (Japan)). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). (CONF-9312105–: 21. National Institute of Radiological Sciences, Chiba (Japan), 2-3 Dec 1993). In *Dose assessment and approach to the safety for the public in the emergency. Proceedings.* 210p. Order Number DE95747912. Source: OSTI; NTIS; INIS.

With the recent advance of the utilization of nuclear energy in a large scale, social interest is being focussed in the potential risk which the nuclear technology will accompany. Especially after the accidents in Chernobyl and other nuclear facilities, serious anxiety to the utilization of nuclear energy is prevailing among the general public. In order to meet the anxiety and distrust of the population in the use of the nuclear power, the health effect or risk which radioactive materials released into the environment will bring about should be comprehensively and properly evaluated, and then should be widely reported to the population. The development of HESANS code system (Health and Environmental Safety Assessment Network System) was planned to set up such a comprehensive computer code that covers a whole pathway of radioactive material from its release to estimates of derived health effects in the population, including the countermeasures for intervention as well. Though the whole system is not totally completed yet so far, the framework of the system has been concreted together with many sub-systems which compose the main part of the code. This report puts main stress on the objective of the development project and the main frame or the structure of the code system. (author).

16505 (NIRS-R–25, pp. 35-39) **Transfer of environmental tritium into organically bound form in foodstuffs and plant.** Inoue, Yoshikazu (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Miyamoto, Kiriko; Iwakura, Tetsuo. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

From the significance, with respect to dose, of organically bound tritium (OBT) in diet, transfer of environmental tritium into OBT was investigated by evaluating a specific activity ratio (SAR) of OBT to that of tissue free water tritium (TFWT) for environmental samples. The mean values of SAR of Japanese rice and Chinese rice observed 0.8 and 0.6, respectively suggested that the specific activity of OBT became less than unity due to the isotope discrimination in the assimilation process under the steady state condition. The SAR of about unity was also demonstrated for various kinds of worldwide foodstuffs. The extremely high SAR values reported by Italian researcher are therefore discounted. The SAR of about two observed in pine needles near tritium emitting facilities suggests a longer residence time of OBT than that of TFWT in plants causes the SAR over unity during a later period after a tritium discharge. The SAR value less than 0.4 observed in market foods near facilities suggests that atmospheric HTO vapor affects both TFWT and exchangeable OBT and causes the SAR less than about 0.4 during a short period after a tritium discharge. These phenomena should be taken into account to evaluate a variation of SAR under the non-steady state condition. The direct OBT formation in plant by elemental tritium was disregarded by a T_2 gas release experiment in Canada. (author).

16506 (NREL/SP–420-6365) **BioFacts: Fueling a stronger economy, Global warming and biofuels emissions.** National Renewable Energy Lab., Golden, CO (United States). Dec 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94006864. Source: OSTI; NTIS; GPO Dep.

The focus of numerous federal and state regulations being proposed and approved today is the reduction of automobile emissions – particularly carbon dioxide (CO_2), which is the greenhouse

gas considered responsible for global warming. Studies conducted by the USDOE through the National Renewable Energy Laboratory (NREL) indicate that the production and use of biofuels such as biodiesel, ethanol, and methanol could nearly eliminate the contribution of net CO_2 from automobiles. This fact sheet provides and overview of global warming, followed by a summary of NREL's study results.

16507 (SAND–95-0273) **Winter season air pollution in El Paso-Ciudad Juarez. A review of air pollution studies in an international airshed.** Einfeld, W.; Church, H.W. Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 166p. Sponsored by USDOE, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009083. Source: OSTI; NTIS; GPO Dep.

This report summarizes a number of research efforts completed over the past 20 years in the El Paso del Norte region to characterize pollution sources and air quality trends. The El Paso del Norte region encompasses the cities of El Paso, Texas and Ciudad Juarez, Chihuahua and is representative of many US-Mexico border communities that are facing important air quality issues as population growth and industrialization of Mexican border communities continue. Special attention is given to a group of studies carried out under special US Congressional funding and administered by the US Environmental Protection Agency. Many of these studies were fielded within the last several years to develop a better understanding of air pollution sources and trends in this typical border community. Summary findings from a wide range of studies dealing with such issues as the temporal and spatial distribution of pollutants and pollution potential from both stationary and mobile sources in both cities are presented. Particular emphasis is given to a recent study in El Paso-Ciudad Juarez that focussed on winter season PM_{10} pollution in El Paso-Ciudad Juarez. Preliminary estimates from this short-term study reveal that biomass combustion products and crustal material are significant components of winter season PM_{10} in this international border community.

16508 (SAND–95-0571C) **Preliminary design for Arctic atmospheric radiative transfer experiments.** Zak, B.D. (Sandia National Labs., Albuquerque, NM (United States)); Church, H.W.; Stamnes, K.; Shaw, G.; Filyushkin, V.; Jin, Z.; Ellingson, R.G.; Tsay, S.C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950153–3: 4. conference on polar meteorology and oceanography, Dallas, TX (United States), 15-20 Jan 1995). Order Number DE95009580. Source: OSTI; NTIS; GPO Dep.

If current plans are realized, within the next few years, an extraordinary set of coordinated research efforts focusing on energy flows in the Arctic will be implemented. All are motivated by the prospect of global climate change. SHEBA (Surface Energy Budget of the Arctic Ocean), led by the National Science Foundation (NSF) and the Office of Naval Research (ONR), involves instrumenting an ice camp in the perennial Arctic ice pack, and taking data for 12–18 months. The ARM (Atmospheric Radiation Measurement) North Slope of Alaska and Adjacent Arctic Ocean (NSA/AAO) Cloud and Radiation Testbed (CART) focuses on atmospheric radiative transport, especially in the presence of clouds. The NSA/AAO CART involves instrumenting a sizeable area on the North Slope of Alaska and adjacent waters in the vicinity of Barrow, and acquiring data over a period of about 10 years. FIRE (First ISCCP [International Satellite Cloud Climatology Program] Regional Experiment) Phase 3 is a program led by the National Aeronautics and Space Administration (NASA) which focuses on Arctic clouds, and which is coordinated with SHEBA and ARM. FIRE has historically emphasized data from airborne and satellite platforms. All three program anticipate initiating Arctic data acquisition during spring, 1997. In light of his historic opportunity, the authors discuss a strawman atmospheric radiative transfer experimental plan that identifies which features of the radiative transport models they think should be tested, what experimental data are required for each type of test, the platforms and instrumentation necessary to acquire those data, and in general terms, how the experiments could be conducted. Aspects of the plan are applicable to all three programs.

16509 (SH-Beretning–61) **Smoke cleaning in small straw boilers. Venturi scrubber.** Kristensen, J.K. (Statens Husdyrbrugsforsoeg, Afd. for Bygningsteknik (Denmark)); Keller, P.; Germann, L. Statens Husdyrbrugsforsoeg, Horsens (Denmark). Afd. for Jordbrugsteknik. 1995. 66p. (In Danish). Contract ENS-51161-92.0094. Order Number DE95766517. Source: OSTI; NTIS.

In 1993-94 the National Institute of Agricultural engineering (SjF, Denmark) developed a scrubber which worked on the Venturi principle. Dust emission reductions of 85-90% could be achieved in an automatically charged straw boiler. Water is added, while the velocity of flue gas inside the scrubber increases to 50-90 m/s. At a fan pressure of 7.5 kPa and a dust content of 600 mg/m^3_n in the smoke an efficiency of 70% can be achieved. For a smoke quantity of 250 m^3/h, which is equivalent to a charged effect of 100 kW, it has not been possible to find a fan with an efficiency higher than about 25% at a pressure of 7.5 kPa. The power requirement of the scrubber is 2.3 kW. Standard fans have efficiencies higher than 50% and air flows that make the fans suitable for boilers of 400-800 kW, in large boilers the relative power requirement for the scrubbers can be reduced to half. Scrubbers discharge 2 l of drainage water pr. hr. hour which can profitably be conducted to a slurry tank or a cesspool. Corrosion by scrubbing water has been demonstrated around the weldings of the acid-resistant steel sheet. During operation the water in the scrubber is heated to about 55 deg. C. The heating energy generated can be exploited by using a heat exchanger, e.g. for underfloor heating etc. Scrubbers require a supply of 11 l of mains water per running hour. The efficiency of the boiler while cleaning the flue gas can be raised from 80 to more than 90%. Maintenance needs are limited. (AB)(812 refs.)

16510 (SNV–4231) **Regional formation of oxidants. Caused by emissions from wood firing.** Andersson-Skoeld, Y. (Swedish Environmental Research Inst., Stockholm (Sweden)). Swedish Environmental Protection Agency, Solna (Sweden). Sep 1993. 28p. (In Swedish). Order Number DE95766689. Source: OSTI; NTIS; INIS.

An atmospheric trajectory model has been used in case studies to calculate the regional ozone formation due to emissions from household wood burning in Sweden. The simulations are conducted in various types of environments and describe a number of different meteorological conditions. The case studies show that the ozone contribution from wood burning is low. The formation of PAN and aldehydes is more pronounced. The concentration of PAN in Sweden is, however, expected to be far below the levels affecting health and environment as are the concentrations of aldehydes. 25 refs, 7 tabs

16511 (STUK-A–119) **Indoor radon measurements and radon prognosis for eastern Uusimaa. Askola, Lapinjaervi, Lillendal, Lovlisa, Myrskylae, Maentsaelae, Maentsaelae, Pernaja, Pornainen, Porvoo, Porvoon mlk, Pukkila, Ruotsinpyhtaeae and Sipoo.** Voutilainen, A.; Maekelaeinen, I. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Feb 1995. 64p. (In Finnish). Order Number DE95628662. Source: OSTI; NTIS; INIS.

The purpose of the regional radon prognosis is to classify areas with different levels of radon risk. The radon prognosis gives the percentages of future homes expected to have indoor radon concentrations exceeding the levels of 200 and 400 Bq/m^3. It is assumed that no protection against the entry of radon is used in construction. In the study about 2400 indoor radon measurements made in single family houses, semi-detached houses and row houses were used. Data on the location, geology and construction of buildings were determined form maps and questionnaires. An empirical statistical model, the adjusted indoor radon measurement and geological data were used to assess the radon risk form soil and bedrock in different areas. (15 refs., 19 figs., 9 tabs.).

16512 (SVF–531) **Iron sulphate as a reducing agent in converting NO_2 to NO in connection with NO_x measurements of flue gas.** Henriksson, M. (Vattenfall Utveckling AB, Vaellingby (Sweden)); Axelsson, H.; Baeckstroem, S.; Ljungstroem, E. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995. 70p. (In Swedish). Project Vaermeforsk-U3-405. Order Number DE95766639. Source: OSTI; NTIS.

Figures and tables with text in English.

The aim of this project has been to evaluate the possibility to use iron(II)sulphate as a reducing agent in converting NO_2 to NO in connection with NO_x-measurements of flue gas. The basis of this work is the need of measurement techniques of NO_x ($NO+NO_2$) in flue gas, when charging emission fees. This report includes the entire project. The conversion efficiency has been studied by analysis of the NO/NO_x-ratio with a chemiluminescence instrument before and after the converter. Experimental work with the purpose of deciding the iron sulphate-converter specificity for NO_2 has been made by adding components, present in flue gas to the sample gas. X-ray diffraction has been used to describe reaction products and determine different crystalline phases of ferrous sulphate. Long-run tests to investigate total conversion capacity, and field tests measuring of NO_x in flue gas with different composition, have been carried out. The results show that, when using iron(II)sulphate for reduction of NO_2, parameters such as temperature and dew point are important. The conversion efficiency as well as the capacity were shown to be strongly influenced by temperature and dew point. The conversion reaction has, however been shown to be specific to NO_2, which is an important aspect in flue gas measuring. The high capacity of iron sulphate which have been shown in laboratory tests can not be transferred to measurements in flue gas. The results from the field tests show that an iron sulphate converter can be used under shorter measuring periods, but the conversion efficiency is reduced under longer periods and the capacity is not comparable to conventional converters. 19 refs, 19 figs, 7 tabs, 3 appendices

16513 (UCRL-ID–119565) **Calculation of a residual mean meridional circulation for a zonal-mean tracer transport model.** Choi, W.K. (Lawrence Livermore National Lab., CA (United States). Global Climate Research Div.); Rotman, D.A.; Wuebbles, D.J. Lawrence Livermore National Lab., CA (United States). [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009474. Source: OSTI; NTIS; GPO Dep.

Because of their computational advantages, zonally-averaged chemical-radiative-transport models are widely used to investigate the distribution of chemical species and their change due to the anthropogenic chemicals in the lower and middle atmosphere. In general, the Lagrangian-mean formulation would be ideal to treat transport due to the zonal mean circulation and eddies. However, the Lagrangian formulation is difficult to use in practical applications. The most widely-used formulation for treating global atmospheric dynamics in two-dimensional models is the transformed Eulerian mean (TEM) equations. The residual mean meridional circulation (RMMC) in the TEM system is used to advect tracers. In this study, the authors describe possible solution techniques for obtaining the RMMC in the LLNL two-dimensional chemical-radiative-transport model. In the first section, the formulation will be described. In sections 3 and 4, possible solution procedures will be described for a diagnostic and prognostic case, respectively.

16514 (UCRL-ID–119749) **Recent upgrades and enhancements of the FEM3A model.** Chan, S.T. Lawrence Livermore National Lab., CA (United States). Dec 1994. 56p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009560. Source: OSTI; NTIS; GPO Dep.

In 1984, the US Army Edgewood Research, Development and Engineering Center began to fund Lawrence Livermore National Laboratory to further develop FEM3, a fully three-dimensional heavy-gas dispersion model, as a research tool for studying the atmospheric transport and diffusion of certain chemical systems. As a result, a significantly improved version of the model, called FEM3A, was delivered to ERDEC in 1988. During the past few years, two more major improvements have been developed and tested. They are: improved mass conservation for treating dispersion scenarios with large density variations, and the addition of an advanced turbulence submodel based on the k-ε transport equations. These enhancements have resulted in substantial improvements in the dispersion simulations of heavy-gases and can greatly extend the range of applicability of the model, including the ability to treat problems with large density variations and dispersion scenarios of much greater complexities. Documented in this report are the new features and some of the improvements obtained with the new model.

16515 (UCRL-JC–118404) **Numerical simulation of the Langevin equation for skewed turbulence.** Ermak, D.L. (Lawrence Livermore National Lab., CA (United States)); Nasstrom, J.S. Lawrence Livermore National Lab., CA (United States); EG and G Energy Measurements, Inc., Pleasanton, CA (United States). Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-93NV11265 ; W-7405-ENG-48. (CONF-950381–1: 11. symposium on boundary layers and turbulence, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95009477. Source: OSTI; NTIS; GPO Dep.

In this paper the authors present a numerical method for the generalized Langevin equation of motion with skewed random forcing for the case of homogeneous, skewed turbulence. The authors begin by showing how the analytic solution to the Langevin equation for this case can be used to determine the relationship between the particle velocity moments and the properties of the skewed random force. They then present a numerical method that uses simple probability distribution functions to simulate the effect of the random force. The numerical solution is shown to be exact in the limit of infinitesimal time steps, and to be within acceptable error limits when practical time steps are used.

16516 (UCRL-JC–118405) **Large-eddy simulation of the development of stably-stratified atmospheric boundary layers over cool flat surfaces.** Cederwall, R.T. Lawrence Livermore National Lab., CA (United States). Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950381–2: 11. symposium on boundary layers and turbulence, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95009574. Source: OSTI; NTIS; GPO Dep.

The stable boundary layer (SBL) has received less attention in atmospheric field studies, laboratory experiments, and numerical modeling than other states of the atmospheric boundary layer. The low intensity and potential intermittency of turbulence in the SBL make it difficult to measure and characterize its structure. Large-eddy simulation (LES) offers an approach for simulating the SBL and, in particular, its evolution from the onset of surface cooling. Traditional approaches that involve Reynolds-averaged models of turbulence are not able to simulate the stochastic nature of the intermittent turbulence that is associated with the SBL. LES shows promise in this area through its explicit calculation of turbulent eddies at resolved scales. In the LES approach, the Navier-Stokes equations governing the flow are averaged (filtered) over some small interval, such as one or more cells of the computational grid. The grid size is small enough so that large eddies, which carry most of the turbulent energy, are explicitly calculated. The turbulence associated with the subgrid-scale (SGS) eddies is modeled. In the Reynolds-averaging approach, on the other hand, the turbulence model must account for all scales of turbulence. Thus the advantage of LES is that the choice of turbulence parameterization for the SGS turbulence is not nearly as critical as in the Reynolds-averaged approach. Complications faced by turbulence models, such as anisotropy and pressure-strain correlations, are associated mainly with large, energy-containing eddies. LES offers the potential for more realistic simulations since the more complicated features of turbulence are calculated explicitly. The ability of LES to simulate the stochastic behavior of turbulence makes this approach suitable for developing and testing stochastic models of turbulent diffusion. One of the goals of the present work is to provide stochastic datasets to be used in such studies.

16517 (WHC-SA–2809) **A comparison of models to assess the atmospheric dispersion of resuspended radionuclides on the Nevada Test Site.** Green, J.R. (Westinghouse Hanford Co., Richland, WA (United States)); Eckart, R.E. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-941102–42: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE95010064. Source: OSTI; NTIS; INIS; GPO Dep.

A study of computer codes was made to determine the suitability of their use for modeling radionuclide dispersion from attachment to fugitive dust at the GMX safety shot area of the Nevada Test site. Two codes, the Industrial Source Complex 2 Long Term Model (ISCLT2) and the Fugitive Dust Model (FDM), were subsequently chosen to model the GMX site. Dose calculations were performed using the output values generated by the computer codes. The concentration values produced by the two codes were within a factor of two of each other and were not significantly different. The FDM, however, was felt to be a more useful code for use in calculating doses caused by attachment to fugitive dust.

16518 (ANL/ESD/TM–82) **Geophysical exploration in the Lautertal at the Combat Maneuver Training Center, Hohenfels, Germany.** Heigold, P.C.; Thompson, M.D.; Borden, H.M. Argonne National Lab., IL (United States). Oct 1994. 73p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95009317. Source: OSTI; NTIS; GPO Dep.

Geophysical exploration was conducted in the Lautertal at the Combat Maneuver Training Center, Hohenfels, Germany, to determine the shallow geological framework of a typical dry valley in this karstic environment. The complementary methods of electromagnetic surveying, vertical electrical soundings, and seismic refraction profiling were successful in determining the depth and configuration of the bedrock surface, the character of the unconsolidated deposits resting on the bedrock surface, and the nature of the bedrock surface. Channels and other depressions in the bedrock surface are aligned with structurally induced fractures in the bedrock. The unconsolidated deposits consist of coarse alluvium and colluvium, which are confined to these channels and other depressions, and fine-grained loam and loess, which cover most of the Lautertal. Wide ranges in the electrical and elastic parameters of the bedrock surface are indicative of carbonate rock that is highly fractured and dissolved at some locations and competent at others. Most local groundwater recharge occurs in the uplands where the Middle Kimmeridge (Delta) Member of the Maim Formation (Jurassic) is widely exposed. These carbonate rocks are known to be susceptible to dissolution along the fractures and joints; thus, they offer meteoric waters ready access to the main shallow aquifers lower in the Malm Formation. These same rocks also form the bedrock surface below many of the dry valleys, but in the Lautertal, the infiltration of meteoric waters into the subsurface is generally impeded by the surficial layer of fine-grained loam and loess, which have low hydraulic conductivity. Further, the rocks of the Middle Kimmeridge Member appear to be closely associated with the localized occurrence of turbidity in such perennial streams as the Lauterach.

16519 (BNL–61426) **Remediation options for a chromium contaminated landfill using cementitious grouts.** Allan, M.L. (Brookhaven National Lab., Upton, NY (United States). Dept. of Applied Science); Kukacka, L.E. Brookhaven National Lab., Upton, NY (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950216–105: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009544. Source: OSTI; NTIS; GPO Dep.

In-situ remediation of a chemical waste landfill with excessive chromium levels is being investigated as part of the Mixed Waste Landfill Integrated Demonstration. This paper is concerned with the design of advanced cementitious grouts for in-situ stabilization of chromium contaminated soil and in-situ installation of subsurface containment barriers. Grouts have been developed to improve the performance and cost effectiveness of remediation compared with conventional materials. In addition to restoration of chromium contaminated soils, the developed grouts have applications in other environmental operations where superior properties are required.

16520 (CONF-9503120–1) **Radionuclide containment in soil by phosphate treatment.** Lee, S.Y. (Oak Ridge National Lab., TN (United States)); Francis, C.W.; Timpson, M.E.; Elless, M.P. Oak Ridge National Lab., TN (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States);Korea Inst. of Nuclear Safety, Taejon (Korea, Republic of). DOE Contract AC05-84OR21400. From Instructions for the Hazardous Materials Resources Institute conference; Atlanta, GA (United States); 14-15 Mar 1995. Order Number DE95009026. Source: OSTI; NTIS; INIS; GPO Dep.

Radionuclide transport from a contaminant source to groundwater and surface water is a common problem faced by most US Department of Energy (DOE) facilities. Containment of the radionuclide plume, including strontium-90 and uranium, is possible using phosphate treatment as a chemical stabilizer. Such a chemical process occurs in soils under natural environmental conditions. Therefore, the concept of phosphate amendment for radiostrontium and uranium immobilization is already a proven principle. In this presentation, results of bench-scale experiments and the concept of a field-scale demonstration are discussed. The phosphate treatment is possible at the source or near the advancing contaminant plume. Cleanup is still the ideal concept; however, containment through stabilization is a more practical and costeffective concept that should be examined by DOE Environmental Restoration programs.

16521 (DOE/MC/29109–3958) **Road Transportable Analytical Laboratory (RTAL) system.** Engineering Computer Optecnomics, Inc., Annapolis, MD (United States). Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE95000049. Source: OSTI; NTIS; INIS; GPO Dep.

The problem of groundwater contamination at a large number of industrial facilities is well known. Many US Army and Department of Energy (DOE) facilities share this problem of potentially contaminated water as a result of past disposal practices associated with military and energy source development activities. A wide range of contaminants are found at certain installations encompassing industrial pollutants and military-unique materials. The US Army Biomedical Research and Development Laboratory has been conducting research for a number of years on developing better means to determine the hazards associated with exposure to these types of complex mixtures. The methods involve the use of aquatic organisms together with in vitro mutagenicity assays and analytical chemistry in an integrated biological assessment of a specific site. Integrated Biological Assessment is an important development in the Army's continuing efforts to locate, clean and monitor sites contaminated as a result of military operations. This method provides meaningful hazard data regarding whether a test medium contains low levels of industrial or military-unique contaminants. This is an important advance in determining which sites are clean and which require remediation. It provides continuing monitoring of the effectiveness of remediation operations. Engineering Computer Opteconomics (ECO), Inc. was tasked, in a collaborative Army and DOE effort, to develop a transportable Integrated Biological Assessment Laboratory Complex. This multimodular Complex is designed to be taken into remote areas to provide the necessary long-term on-site research for determining hazards from low levels of contamination in the environment. Each module of the Complex is designed to be self-sufficient, to provide a safe environment for the operators, and a controlled environment for the test organisms and related critical chemical and biological analyses.

16522 (DOE/MC/29118–95/C0428) **Field-usable portable analyzer for chlorinated organic compounds.** Buttner, W.J. Transducer Research, Inc., Naperville, IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29118. (CONF-9411149–27: Opportunity 95: environmental technology through small business, Morgantown, WV (United States), 16-17 Nov 1994). Order Number DE95007970. Source: OSTI; NTIS; GPO Dep.

Using an advanced chemical sensor, a hand portable analytical instrument for selectively detecting vapors of chlorinated solvents

was produced. Phase I involved the development and testing of the analyzer and samplers for vapors over a broad concentration range from different sample matrices. The instrument, the RCL MONITOR, was tested in actual hazardous waste site operations. Phase II (initiated June 1994) involves production of full scale units and deployment in actual DOE operations (Hanford, INEL, Savannah River).

16523 (DOE/MC/29467–4036) **Decontamination systems information and research program. Quarterly technical progress report, October 1–December 31, 1994.** West Virginia Univ., Morgantown, WV (United States). Dept. of Civil and Environmental Engineering. Feb 1995. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE95010526. Source: OSTI; NTIS; GPO Dep.

The projects reported during this period are categorized into the following five areas. Bioremediation: In situ Bioremediation of Chlorinated Organic Solvents (MC2B), and Microbial Enrichment for Enhancing In Situ Biodegradation of Hazardous Organic Wastes (MC18); Miscellaneous Remediation Technologies: Prefabricated Vertical Drain research (MC-2a), Chemical Destruction of Chlorinated Organic Compounds (MC-6), and Remediation of Hazardous Sites with Steam Reforming (MC-11); Instrumentation: Evaluation of IR and Mass Spectrometric Techniques for On-Site Monitoring (MC-23); Technology Assessments: Winfield Lock and Dam (MC-9); Additional Projects: Environmental Pollution Control Devices Based on Novel Forms of Carbon (MC-17) and Development of Standard Test Protocols and Barrier Design Models for In Situ Formed Barriers (MC26). Summaries of the significant accomplishments for the projects reported during this period are presented.

16524 (DOE/NV–391) **Geophysical investigation, Salmon Site, Lamar County, Mississippi.** International Technology, Inc., Las Vegas, NV (United States). Feb 1995. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-92NV10972. Order Number DE95008215. Source: OSTI; NTIS; INIS; GPO Dep.

Geophysical surveys were conducted in 1992 and 1993 on 21 sites at the Salmon Site (SS) located in Lamar County, Mississippi. The studies are part of the Remedial Investigation/Feasibility Study (RI/FS) being conducted by IT Corporation for the U.S. Department of Energy (DOE). During the 1960s, two nuclear devices and two chemical tests were detonated 826 meters (in) (2710 feet [ft]) below the ground surface in the salt dome underlying the SS. These tests were part of the Vela Uniform Program conducted to improve the United States capability to detect, identify, and locate underground nuclear detonations. The RI/FS is being conducted to determine if any contamination is migrating from the underground shot cavity in the salt dome and if there is any residual contamination in the near surface mud and debris disposal pits used during the testing activities. The objective of the surface geophysical surveys was to locate buried debris, disposal pits, and abandoned mud pits that may be present at the site. This information will then be used to identify the locations for test pits, cone penetrometer tests, and drill hole/monitor well installation. The disposal pits were used during the operation of the test site in the 1960s. Vertical magnetic gradient (magnetic gradient), electromagnetic (EM) conductivity, and ground-penetrating radar (GPR) surveys were used to accomplish these objectives. A description of the equipment used and a theoretical discussion of the geophysical methods are presented Appendix A. Because of the large number of figures relative to the number of pages of text, the geophysical grid-location maps, the contour maps of the magnetic-gradient data, the contour maps of the EM conductivity data, and the GPR traverse location maps are located in Appendix B, Tabs I through 22. In addition, selected GPR records are located in Appendix C.

16525 (DOE/NV/10845–46) **Scoping calculations for groundwater transport of tritium from the Gnome Site, New Mexico.** Pohlmann, K.; Andricevic, R. Nevada Univ., Las Vegas, NV (United States). Water Resources Center; National Regulatory Research Inst., Columbus, OH (United States). Aug 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95009110. Source: OSTI; NTIS; INIS; GPO Dep.

Analytic solutions are employed to investigate potential groundwater transport of tritium from a radioactive tracer site near the Project Gnome site in southeastern New Mexico. The tracer test was conducted in 1963 and introduced significant quantities of radionuclides to the transmissive and laterally continuous Culebra dolomite. Groundwater in the Culebra near Gnome travels toward a regional discharge point at the Pecos River, a distance of about 10 to 15 km, depending on flow path. Groundwater transport of radionuclides from the Gnome site is therefore of interest due to the proximity of the accessible environment and the 31-year time period during which migration is likely to have occurred. The analytical stochastic solutions used incorporate the heterogeneity observed in the Culebra by treating transmissivity as a spatially correlated random field. The results indicate that significant spreading of tritium will occur in the Culebra dolomite as a result of the combination of relatively high transmissivity, high spatial variability, and high spatial correlation of transmissivity. Longitudinal spreading may cause a very small fraction of tritium mass to arrive at the Pecos River within the 31 years since the tracer test. However, dilution and transverse dispersion will act to distribute this mass over a very large volume, thereby reducing groundwater concentrations. Despite the high degree of spreading, the calculations indicate that most of the tritium remains near the source. At present, the center of mass is estimated to have moved approximately 260 m downgradient of the test location and about 95 percent of the mass is estimated to have remained within about 1 km downgradient.

16526 (DTU-ISVA-PR–75, pp. 1-17) **1. Simulation of turbulent diffusion of suspended sediment by a random walk model.** Deigaard, R.; Asp Hansen, E. Danmarks Tekniske Univ., Lyngby (Denmark). Inst. for Stroemningsmekanik og Vandbygning. 1994. In *Progress report no. 75.* 82p. Order Number DE95766444. Source: OSTI; NTIS.

Diffusion and turbulent diffusion can be modelled as a random walk process. If there is a gradient in the diffusion coefficient, a correction must be introduced to compensate for an artificial drift in the direction of a decreasing diffusion coefficient. Random walk simulations of the time-varying suspended sediment concentration in a turbulent boundary layer are compared with numerical solutions to the turbulent diffusion equation. (au)

16527 (DTU-ISVA-PR–75, pp. 65-82) **5. Turbulent wave boundary layers in semi-3D flow.** Hasbo, P.; Koegh, K.; Asp Hansen, E.; Fredsoee, J. Danmarks Tekniske Univ., Lyngby (Denmark). Inst. for Stroemningsmekanik og Vandbygning. 1994. In *Progress report no. 75.* 82p. Order Number DE95766444. Source: OSTI; NTIS.

A boundary layer model based on the integrated momentum equation for arbitrary flow over a plane wall is presented. The model predicts the time development of the boundary layer thickness, the bed shear stress, and the shear stress direction. The flow in the boundary layer is assumed turbulent and described by a logarithmic velocity variation and a parabolic variation in the velocity direction. The flow outside the boundary layer is assumed to be shear-free. Further, the model is restricted to the special flow case where no spatial variations exist along a certain direction along the plane wall. Hereby the calculations can be squeezed down to the solution of a 2-D flow problem. In the present paper the model is used for calculating flow cases where flow particle orbits outside the boundary layer are closed curves and described by ellipses. This flow situation occurs for instance above the bed under 3-D waves with no mass transport, or along a vertical wall approached by oblique waves. (au)

16528 (ENEA-RT-AMB–92-17) **Evaluation of impact from Chernobyl accident.** Cigna, A.A. (ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute). ENEA, Saluggia (Italy). Centro Ricerche Energia. May 1993. 39p. (RT/AMB–92-17). Order Number DE95771049. Source: OSTI; NTIS (US Sales Only).

The impact on society of the Chernobyl accidents is assessed. The situation prior to Chernobyl with respect to regulations of radiation protection against the consequences of a major accident is considered. The development of the recommendations and regulations issued by the Commission of the European Communities for the Maximum Permitted Levels of different groups of radionuclides

in foodstuffs in reviewed. The different reactions to the accident are examined and some data on the average individual effective dose equivalents estimated in a number of countries are also reported. A simple and reliable method to evaluate the levels of Cs ^{134}, Cs ^{137} and Cs ^{90} in green vegetables, hay and milk on the basis of the soil deposition only is described and experimental results are given. The model appears to be rather conservative and to overestimate the contamination. Finally some main problems concerning the information of the public and the preparedness for possible future accidents are also summarized.

16529 (ETDE-IT–95-15) **Two laser excitation technique to monitor plant fluorescence.** Barbini, R. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Colao, F.; Fantoni, R.; Palucci, A.; Ribezzo, S. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. 1994. 8p. (CONF-941269–1: International conference on lasers '94, Quebec (Canada), 12-16 Dec 1994). Order Number DE95771046. Source: OSTI; NTIS (US Sales Only).

The two-pulses laser induced fluorescence technique to monitor the plant photosynthetic activity has been investigated both theoretically and experimentally. A mathematical model has been developed to describe possible relaxation processes occurring in the photosynthetic apparatus under single or dual laser excitations. Experimental results obtained by the two-pulses technique are reported and compared with model predictions.

16530 (FEMP–2384) **Determination of total and isotopic uranium by inductively coupled plasma-mass spectrometry at the Fernald Environmental Management Project.** Miller, F.L.; Bolin, R.N.; Feller, M.T.; Danahy, R.J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-9410207–2: Symposium on applications of inductively coupled plasma mass spectrometry (ICP-MS) to radionuclide determinations, Gatlinburg, TN (United States), 11-13 Oct 1994). Order Number DE95009012. Source: OSTI; NTIS; INIS; GPO Dep.

At the Fernald Environmental Management Project (FEMP) in southwestern Ohio, ICP-mass spectrometry (ICP-MS), with sample introduction by peristaltic pumping, is used to determine total and isotopic uranium (U-234, U-235, U-236 and U-238) in soil samples. These analyses are conducted in support of the environmental cleanup of the FEMP site. Various aspects of the sample preparation and instrumental analysis will be discussed. Initial sample preparation consists of oven drying to determine moisture content, and grinding and rolling to homogenize the sample. This is followed by a nitric/hydrofluoric acid digestion to bring the uranium in the sample into solution. Bismuth is added to the sample prior to digestion to monitor for losses. The total uranium (U-238) content of this solution and the U^{235}/U^{238} ratio are measured on the first pass through the ICP-MS. To determine the concentration of the less abundant U^{234} and U^{236} isotopes, the digestate is further concentrated by using Eichrom TRU-Spec extraction columns before the second pass through the ICP-MS. Quality controls for both the sample preparation and instrumental protocols will also be discussed. Finally, an explanation of the calculations used to report the data in either weight percent or activity units will be given.

16531 (GTK-YST–85) **The Palmottu Analogue Project, Progress Report 1993. The behaviour of natural radionuclides in and around uranium deposits, Nr. 7.** Ruskeeniemi, T. (Geological Survey of Finland, Espoo (Finland)); Blomqvist, R.; Suksi, J.; Niini, H. Geological Survey of Finland, Espoo (Finland). 1994. 97p. Order Number DE95628645. Source: OSTI; NTIS; INIS.

Nuclear waste disposal research.

The report gives a summary of the results of investigations carried out in 1993 at the Palmottu natural analogue study site, which comprises a small U-Th mineralization in Nummi-Pusula, southwestern Finland. Additionally, the report includes several separate articles dealing with various aspects of the Palmottu Analogue Project: (1) 3-dimensional model of fracture zones, (2) redox chemistry of uranium in groundwater, (3) humic substances in groundwater, (4) uranium mineralogy, (5) importance of selective extractions in uranium migration studies, (6) modelling of matrix diffusion, and (7) uranium in surficial deposits. The Palmottu Analogue Project aims at a more profound understanding of radionuclide transport processes in fractured crystalline bedrock. The essential factors controlling transport are groundwater flow and interaction between water and rock. Accordingly, the study includes (1) structural interpretations partly based on geophysical measurements, (2) hydrological studies including hydraulic drill-hole measurements, (3) flow modelling, (4) hydrogeochemical characterization of groundwater, uranium chemistry and colloid chemistry, (5) mineralogical studies, (6) geochemical interpretation and modelling, (7) studies on mobilization and retardation of uranium, and (8) modelling of uranium series data. Paleohydrogeological aspects are of special interest, due to the anticipated future glaciation of the Fennoscandian Shield. Surficial sediments and waters are studied to gain information on postglacial migration in the overburden. (orig.)

Geological Survey of Finland, Espoo (Finland). 1994. In *The Palmottu Analogue Project, Progress Report 1993. The behaviour of natural radionuclides in and around uranium deposits, Nr. 7.* 97p. Order Number DE95628645. Source: OSTI; NTIS; INIS.

The structural features of the Palmottu U-Th-deposit were studied by geophysical measurements and drill core loggings, the main focus of interest being in recognizing fractures or fracture zones that might be important pathways for groundwater flow. In order to determine the location and geometry of most important hydraulic zones, several different geophysical measurements including mise-a-la-masse, ground penetrating radar, borehole radar and hydraulic tests were carried out. In addition, fractures and fracture infilling were characterized from 21 drill holes. (18 refs., 7 figs., 3 tabs.).

16534 (GTK-YST–85, pp. 37-48) **Redox chemistry of uranium in groundwater of Palmottu uranium deposit, Finland.** Ervanne, H. (Helsinki Univ. (Finland). Dept. of Radiochemistry); Jaakkola, T.; Ahonen, L.; Blomqvist, R. Geological Survey of Finland, Espoo (Finland). 1994. In *The Palmottu Analogue Project, Progress Report 1993. The behaviour of natural radionuclides in and around uranium deposits, Nr. 7.* 97p. Order Number DE95628645. Source: OSTI; NTIS; INIS.

Groundwater redox conditions and oxidation states of dissolved uranium were studied from natural water samples around a uranium deposit. A good consistency between dissolved U(IV)/U(VI) ratio and the measured redox potential value were observed. Dissolved redox pairs were studied in a uranium-rich groundwater sample by monitoring the Eh-change caused by acid/base addition. The results indicated that dissolved uranium in concentration of 0.8 μ mol/l may give nernstian response at platinum electrode. (orig.) (19 refs., 5 figs., 3 tabs.).

16535 (GTK-YST–85, pp. 49-52) **Humic substances in groundwater.** Vuorinen, U. (Technical Research Centre of Finland, Espoo (Finland). Reactor Lab.); Aalto, H. Geological Survey of Finland, Espoo (Finland). 1994. In *The Palmottu Analogue Project, Progress Report 1993. The behaviour of natural radionuclides in and around uranium deposits, Nr. 7.* 97p. Order Number DE95628645. Source: OSTI; NTIS; INIS.

Humic substances and their importance in groundwater is shortly outlined. A description of a method for isolating humic substances from groundwater in the field and for further characterisation is

being tested with commercial humic acid (Aldrich), as well as gel-permeation method for determining the molecular weight. bedrock, it affords the opportunity of studying the stability and alteration of uraninite as an analogue for spent nuclear fuel under various redox conditions. (orig.) (6 refs.).

Uraninite is the major uraniferous mineral in the Precambrian U-Th rich pegmatites at Palmottu. Most euhedral uraninite grains were partially altered by silica-rich hydrothermal solutions during the late stage pegmatitic crystallization. The dominant secondary mineral is uranium silicate, with a chemical composition similar to that of coffinite ($USiO_4$ * Nh_2O). The simultaneous formation of galena and other sulfides with the uranium silicate indicates that the alteration took place under reducing conditions. Hence, uranium occurs predominantly in the uranous (U^{4+}) state. Preliminary mass balance calculations imply that significant amounts of U, Th, and Pb were released during the replacement process. As the Palmottu U-Th deposit extends from ground level to distinctly reduced parts of the bedrock, it affords the opportunity of studying the stability and alteration of uraninite as an analogue for spent nuclear fuel under various redox conditions. (orig.) (28 refs., 5 figs., 1 tab.).

16537 (GTK-YST–85, pp. 65-75) **Selective extractions in uranium migration studies - Findings from a natural analogue study at Palmottu.** Suksi, J. (Helsinki Univ. (Finland). Dept. of Radiochemistry); Saarinen, L.; Ruskeeniemi, T. Geological Survey of Finland, Espoo (Finland). 1994. In *The Palmottu Analogue Project, Progress Report 1993. The behaviour of natural radionuclides in and around uranium deposits, Nr. 7.* 97p. Order Number DE95628645. Source: OSTI; NTIS; INIS.

The usefulness of chemical extractions in the study on uranium migration is considered in the light of the results compiled at Palmottu. Chemical extractions provide a method for evaluating the mass transfer of U and its retardation in geochemical cycling. The present detailed study provides more specific information on the in situ fixation of U on rock materials. The many observations made at Palmottu show the potential of the method to fill the gap in interpretations between the natural partitioning of U in rock and the distribution of artificial tracers determined by the short-term laboratory experiments. (orig.) (20 refs., 4 figs., 1 tab.).

16538 (GTK-YST–85, pp. 77-87) **Modelling prospects for in situ matrix diffusion at Palmottu natural analogue site, SW Finland.** Rasilainen, K. (Technical Research Centre of Finland, Espoo (Finland). Nuclear Engineering Lab.); Suksi, J. Geological Survey of Finland, Espoo (Finland). 1994. In *The Palmottu Analogue Project, Progress Report 1993. The behaviour of natural radionuclides in and around uranium deposits, Nr. 7.* 97p. Order Number DE95628645. Source: OSTI; NTIS; INIS.

Concentration distributions of natural decay chains 4n+2 and 4n+3 in crystalline rock intersected by a natural fracture were measured. Calcite coating on the same fracture surface was dated. Material properties of the rock matrix, and nuclide concentrations in groundwater were measured. The interpretation of the concentration distributions is based on the classical matrix diffusion concept. Although support was obtained, this calibration exercise does not yet validate the model. Besides initial and boundary conditions, matrix properties are uncertain due to the small amount of rock material. Experimental sorption data was not available, but its importance and the need for systematic studies was demonstrated. (orig.) (10 refs., 5 figs., 5 tabs.).

16539 (IAEA-TECDOC–788, pp. 21-43) **Processes controlling the chemical composition of natural waters in the Hreppar-Land in Southern Iceland.** Arnorsson, S. (Iceland Univ., Reykjavik (Iceland). Science Inst.); Andresdottir, A. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

This contribution describes the processes controlling the chemical and isotopic composition of cold and geothermal waters (5-150 deg. C) in the Hreppar-Land area in southern Iceland. The chemical composition of surface-and cold groundwaters are controlled by the salt content of the precipitation, rock dissolution and organic CO_2 from the soil. The dissolved solids content of the geothermal waters is higher than that of the cold waters and it increases with temperature. The cause is increased rock dissolution. Chloride and boron are considered to act as essentially mobile elements in the Icelandic surface- and ground water environment. The Cl-B relationships in the waters are considered to reflect that the geothermal water represents local precipitation. Yet, the $\delta\ ^2H$ values of these waters tend to be lower than that of local waters. This difference is not considered to reflect a distant recharge areas to the geothermal systems on higher ground inland but due to the presence of a small component of "ice-age water" in the geothermal water that entered the bedrock during the deglaciation period, even earlier, when the $\delta\ ^2H$ of meteoric water in Iceland was much lower than that of today's precipitation. 26 refs, 11 figs, 3 tabs.

The typical geothermal water in the Yusung geothermal area, Korea, located in Mesozoic plutonic rocks, has been studied for its characteristics by means of analyzing its tritium, oxygen-18, deuterium and chemical composition. Cold waters, including waters of superficial origin in the same area, were also studied. Deuterium and oxygen-18 contents of thermal groundwater indicate its meteoric-water origin and show the absence of recognizable oxygen isotope (^{18}O) shift to high oxygen-18 composition, likely due to relatively low reservoir temperature. The chemical composition of the Yusung geothermal waters shows that they are partially equilibrated and have mixed with the fresh waters in the upflow. Temperature obtained from the Na-K geothermometer is considered to be reasonably representative of reservoir temperatures. The K-M g geothermometer re-equilibrates rapidly upon cooling and yields for that reason low temperature estimates. Reservoir temperature, according to the Na-K geothermometer, are between 103 deg. C and 133 deg. C. It is inferred that the source of heat is magmatic. The best permeability is considered to be fault controlled. (author). 11 refs, 17 figs 3 tabs.

16541 (IC–95/35) **Effect of source depth correction on the estimation of earthquake size.** Romanelli, F. (Universita degli Studi di Trieste, Trieste (Italy). Istituto di Geodesia e Geofisica); Panza, G. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 7p. Grant CNR 92-02876-54; 93-02492-54; EPOC-CT91-0042; EV5V-CT94-04 Order Number DE95627758. Source: OSTI; NTIS (US Sales Only); INIS.

The relationship between surface wave magnitude, M_s, and seismic moment, M_o, of earthquakes is essential for the estimation of seismic risk in any region. In the hypothesis of constant stress drop, theoretical models predict that Log M_o and M_s are related by a linear law. The slope most commonly found in the literature is around 1.5. Here we show that the application to the Ms values of the necessary correction for the focal depth, gives a general increment of the correlation coefficient, and that a slope around 1.0 is

consistent with the global data, while for regionalized data it can vary from about 1.0 to 2.0. (author). 14 refs, 3 tabs.

16542 (INIS-BR–3482) **Isotope exchange kinetic of phosphorus in soils from Pernambuco State -Brazil.** Figueiredo, F.J.B. de. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Dec 1989. 83p. (In Portuguese). Order Number DE95626503. Source: OSTI; NTIS (US Sales Only); INIS.

PRONUCLEAR. Tese de Mestrado, 51.

The applicability of isotopic exchange kinetics of ^{32} p to characterize phosphorus available to plants and to diagnose the reactivity of soil-fertilizer-P in six soils from Pernambuco is described. This methodology was compared with anion exchange resin, isotopic exchange equilibrium methods (E-value and L-value) and P absorption by plants. The first greenhouse experiment had the following treatments: (1) with P and, (2) with addition of 43.7 mg P/Kg of soil, incubated for O, 42 and 84 days before seeding. The kinetic of isotopic exchange (KIE), resin-P and E-value were determined before seeding and after harvesting pearl millet grown for 42 days. Results indicated that the KIE parameters rated the soils more efficiently, in terms of available P and soil-fertilizer-P reactivity, than resin-P, E-value and L-value. (author). 38 refs, 2 figs, 18 tabs.

16543 (INIS-BR–3483) **Feasibility study of photodiodes utilization in the soil-moisture determination by gamma transmission.** Santos, L.A.P. dos. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Aug 1992. 71p. (In Portuguese). Order Number DE95626519. Source: OSTI; NTIS (US Sales Only); INIS.

PRONUCLEAR. Tese de Mestrado, 59.

This study was done to verify the viability of photodiodes, as gamma radiation detector (^{241} Am - Energy=60 KeV), to measure soil water content. The photodiodes used had different mechanical and electrical characteristics, and were tested on soils of different textures. A good linear correlation between the logarithm of the attenuation factor and soil-moisture demonstrated such viability, and that the low photopeak efficiency of these devices is not a limitation to the measurement of soil water content. Furthermore, the stability, the portability, and low cost of such semiconductor devices, including its electronic system, represent relevant characteristics that may justify the development of a reliable gamma meter system for field studies. (author). 37 refs, 21 figs, 20 tabs.

16544 (INIS-BR–3485) **Radiological impact assessment of building materials on ordinary houses dwellers.** Campos, M.P. de. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1994. 72p. (In Portuguese). Order Number DE95626504. Source: OSTI; NTIS (US Sales Only); INIS.

The radiological impact due to building materials on habitants living in the Santo Andre district of Sao Paulo state, Brazil, was assessed through the total effective dose equivalent rate determination, for external and internal irradiation. The effective dose equivalent rate for external irradiation was calculated by the gamma spectrometry determination of natural radionuclides specific activity in the dwelling materials. The effective dose equivalent rate due to ^{222} Rn inhalation was calculated through the radon indoor activity determination by using solid state nuclear track detectors. (author). 46 refs, 6 figs, 14 tabs.

16545 (INIS-BR–3487) **Unsaturated hydraulic conductivity of a red-yellow podzolic soil in the Northern Zona da Mata of Pernambuco State - Brazil.** Maciel Netto, A. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Aug 1994. 115p. (In Portuguese). Order Number DE95626520. Source: OSTI; NTIS (US Sales Only); INIS.

The determination of the hydraulic conductivity of a Red-Yellow Podzolic Soil was carried out during an experiment in a plot measuring 3.5 m x 3.5 m, at the Experimental Station of Itapirema, Goiania, in Pernambuco State, Brazil. The internal drainage method proposed by Hillel (1972) was used to obtain the hydraulic conductivity as a function of soil water content, $K(\theta)$, in the three characteristic horizons of the soil. Three neutron probes were used for measuring the humidity, that was determined by a calibration curve. Three characteristic horizons of the Red-Yellow Podzolic Soil were investigated for hydraulic conductivity. The sandy A horizon, with large pores, has a high conductivity while the B1t horizon, with a massive structure and few visible pores, has a low infiltration rate. The hydraulic dynamics of the B2 horizon is more complex due to its heterogeneity. (author). 79 refs, 17 figs, 11 tabs.

16546 (INIS-mf–14524) **Rapid determination of soil contamination by helicopter gamma ray spectroscopy.** Winkelmann, I. Bundesamt fuer Strahlenschutz, Berlin (Germany). Fachbereich Strahlenschutz. 1994. 12p. (In German). (CONF-9410338–: Environmental Radioactivity: national seminar with international participation, Sofia (Bulgaria), 11-13 Oct 1994). Order Number DE95627722. Source: OSTI; NTIS (US Sales Only); INIS.

Specific aerial nuclide measurements of surface soil contamination were performed after the Chernobyl accident in the southern part of Germany. A helicopter equipped with a gamma ray spectroscopic system including a HPGe detector (50% relative efficiency) and 3 NaI(Tl)-detectors (volume 12 l) was used. A detailed description is given of the complete measuring system which can also be used for detection of gamma sources, e.g. radioactive fragments of nuclear powered satellites. At an altitude of 100 m, a soil contamination of several kBq/m^2 for ^{134}Cs and ^{137}Cs can be measured for 60 s at a helicopter speed of 100 km/h. For detection of point gamma sources, the NaI(Tl)-detector was used. Assuming a line spacing of 300 m and a speed of 100 km/h, an area of about 30 km^2 can be surveyed per hour. Thus ^{60}Co-sources of some GBq activity can be detected. The system was practically applied for the first time for measuring the man-made radionuclides. The chosen distance between the routes was 10 km, and measuring time - 60 s for each spectrum corresponding to a flight path distance of about 2.2 km over which the average soil contamination was determined. The measured ^{137}Cs values of up to 25 kBq/m^2 are in good agreement with the results obtained by other methods (in-situ-spectrometry, measurements of soil samples). The aerial measuring system was also tested in the former USSR, in a region north of Chernobyl, with nuclide deposition values of up to 2 MBq/m^2. 7 figs., 2 refs. (orig.).

16547 (INIS-mf–14525) **In-situ-gamma ray spectrometry for measurements of environmental radioactivity.** Winkelmann, I. Bundesamt fuer Strahlenschutz, Berlin (Germany). Fachbereich Strahlenschutz. 1994. 21p. (CONF-9410338–: Environmental Radioactivity: national seminar with international participation, Sofia (Bulgaria), 11-13 Oct 1994). Order Number DE95627723. Source: OSTI; NTIS (US Sales Only); INIS.

A detailed description of the method is presented. The range of application is shown. The calibration of the in-situ gamma ray spectrometer with a HPGe semiconductor detector and the evaluation of the spectra are described. A measuring time of about 15-30 min is sufficient to determine the specific natural and man-made radioactivity of the soil of some ten Bq/m^2. The results of soil contamination measurements in Germany after the Chernobyl accident are reported. A total of 22 nuclides are detected. The measured contamination for the first days after the accident was as follows: ^{132}Te/^{132}I - 100 kBq/m^2, and ^{131}I - 70 kBq/m^2. 6 figs., 4 tabs. (orig.).

16548 (INIS-mf–14527) **Intercomparison measurements of surface soil contamination with in-situ gamma ray spectrometry. Pt.1. Artificial radionuclides.** Winkelmann, I. Bundesamt fuer Strahlenschutz, Berlin (Germany). Fachbereich Strahlenschutz. 1994. 9p. (In German). (CONF-9410338–: Environmental Radioactivity: national seminar with international participation, Sofia (Bulgaria), 11-13 Oct 1994). Order Number DE95627724. Source: OSTI; NTIS (US Sales Only); INIS.

This intercomparison program was performed by the Federal Office of Radiation Protection in October 1993. It includes seven laboratory teams from five countries and is applied on a pasture in southern Germany having an undisturbed soil profile. The location was chosen because of its relatively high ^{137}Cs-soil contamination caused by the Chernobyl accident - up to 50 kBq/m^2. The deposition of ^{134}Cs and ^{137}Cs was determined. The comparison demonstrated a good agreement between results from different labs. Additionally, the dose rate at all marked locations was measured and compared to the dose rate of individual radionuclides calculated from the measured spectra. A relatively good agreement was obtained. It is shown that the main contribution to the total

dose rate of 70 nSv/h is made by ^{137}Cs with a value of 5 nSv/h. 4 figs., 2 tabs., 3 refs. (orig.).

Field and laboratory experiments were conducted to examine the fate and transport of petroleum hydrocarbons in the terrestrial environment. During a 2-year field experiment the change in chemical composition of two crude oils, Arabian Heavy and Gullfax and two refined oils, Fuel 2 and a lubricating oil were analysed using GC/FID and GC/MS. Soil column experiments were conducted to study the leaching of petroleum hydrocarbons under flow conditions similar to those in the field experiments and the leaching was described by the mobile-immobile zones transport model. (au) (48 refs.)

16553 (PNL–10483) **Direct measurement of strontium-90 and uranium-238 in soils on a real-time basis: 1994 summary report.** Schilk, A.J.; Hubbard, C.W.; Knopf, M.A.; Thompson, R.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010548. Source: OSTI; NTIS; INIS; GPO Dep.

Traditional methodologies for quantitative characterization of radionuclide-contaminated soils over extended areas are often tedious, costly, and non-representative. A rapid characterization methodology was designed that provides reliable output with spatial resolution on the order of a few meters or less. It incorporates an innovative sensor of square plastic scintillating fibers that has been designed to be placed directly on or above a contaminated soil to detect and quantify high-energy beta particles associated with the decay chains of uranium and/or strontium. Under the direction and auspices of the DOE's Characterization, Monitoring, and Sensor Technology Integrated Program, Pacific Northwest Laboratory (PNL) constructed a high-energy beta scintillation sensor that was optimized for the detection and quantification of uranium and strontium contamination in surface soils (in the presence of potentially interfering natural and anthropogenic radionuclides), demonstrated and evaluated this detector in various field and laboratory scenarios, and provides this document in completion of the aforementioned requirements.

16554 (PNL–10485) **Application of in situ vitrification in the soil subsurface: Engineering-scale testing.** Luey, J.; Seiler, D.K. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010204. Source: OSTI; NTIS; INIS; GPO Dep.

Engineering-scale testing to evaluate the initiation and propagation of the in situ vitrification (ISV) process in the soil subsurface has been completed. Application of ISV in the soil subsurface both increases the applicable treatment depth (beyond a demonstrated 5 m) and allows treatment of local contamination, such as liquid seepage trenches (found on many US Department of Energy sites) that were designed to remove contamination at the bottom of the trench. The following observations and conclusions resulted from the test data: the ISV process can be initiated in the soil subsurface and propagated in both vertical directions, with the downward direction providing greater ease of operation; energy efficiency to process a kilogram of soil was 20% better than for an ISV melt initiated at the soil surface, increased efficiency was attributed to insulation from the soil overburden; the feasibility of initiating the process with a planar starter path was confirmed, thus increasing the number of options for initiating the process in the field; soil subsidence was pronounced and requires attention before field demonstration of subsurface ISV. Further field work at pilot-scale is recommended for this new ISV application. The key step will be the placement of starter material at depth to initiate the process.

16555 (PNL-SA–24663) **A man-portable supercritical fluid extractor.** Wright, B.W.; Zemanian, T.S.; Lee, R.N.; Wright, C.W. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950209–4: 4. international symposium on field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 22-24 Feb 1995). Order Number DE95009571. Source: OSTI; NTIS; GPO Dep.

A new prototype supercritical fluid extraction (SFE) apparatus has been developed for the on-site preparation of solid matrix samples for subsequent organic analysis. The apparatus consists of two parts, each of which satisfy weight and size requirements for portability. They are a generator module that supplies high-pressure carbon dioxide (the source of which is dry ice) and a briefcase containing a pressure regulator, extraction cells, valves for flow control, flow restriction hardware, equipment for sample collection, temperature control devices, and ancillary supplies. The generator module provides carbon dioxide at pressures to 1 kbar (~14,500 psi), incorporates no moving parts, and allows rapid loading without tools due to novel fingertight closures. Samples are contained in sintered inserts that fit inside three extraction cells that also have rapid, fingertight closures. Analyte collection can be accomplished using liquid solvent or restrictorless rapid depressurization techniques. Control schemes allow operation at a wide variety of pressures and temperatures and the use of static, dynamic, or hybrid static/dynamic extraction strategies. The technical performance of the prototype apparatus was evaluated by comparison of results from the SFE of a soil sample spiked with six to nine organic compounds of environmental interest to Soxhlet extraction.

16556 (SAND–95-0318C) **Geochemical and stable isotope variations in baseflow from an urbanized watershed: White Rock Creek, Dallas, Texas.** Hercod, D.J. (State Medical Univ., Dallas, TX (United States). Dept. of Geological Sciences); Gregory, R.T.; Brady, P.V. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950178–1: 24. water for Texas conference, Austin, TX (United States), 25-26 Jan 1995). Order Number DE95008528. Source: OSTI; NTIS; INIS; GPO Dep.

Public concerns about surface water quality and its impact on health issues have put a premium on the ability to predict surface and groundwater quality in urban areas. The movement of toxins and nutrients in urban areas is largely controlled by interactions with soil and aquifer minerals along hydrologic pathways. Despite

progress in theoretical modeling of the effects of these interactions on water chemistry, it is presently impossible to predict overall trends in urban water quality. Determining the controls on stream water chemistry is problematic due to the interplay between different hydrologic reservoirs which cannot be easily observed or measured. Natural tracers, such as dissolved ions and isotopes, provide an indirect method for observing subsurface interactions and are useful for time series analysis of stream water composition. Ionic species are generally nonconservative components because of chemical reactions and are thus useful for discerning the overall discharge chemistry affected by the relationship.

16557 (SAND–95-0574C) **Offsite demonstrations for MWLID technologies.** Williams, C. (Sandia National Labs., Albuquerque, NM (United States)); Gruebel, R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504135–1: 5. annual waste-management education and research consortium (WERC) technology development conference, Las Cruces, NM (United States), 18-20 Apr 1995). Order Number DE95009585. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of the Offsite Demonstration Project for Mixed Waste Landfill Integrated Demonstration (MWLID)-developed environmental site characterization and remediation technologies is to facilitate the transfer, use, and commercialization of these technologies to the public and private sector. The meet this goal, the project identified environmental restoration needs of mixed waste and/or hazardous waste landfill owners (Native American, municipal, DOE, and DoD); documenting potential demonstration sites and the contaminants present at each site; assessing the environmental regulations that would effect demonstration activities; and evaluating site suitability for demonstrating MWLID technologies at the tribal and municipal sites identified. Eighteen landfill sites within a 40.2-km radius of Sandia National Laboratories are listed on the CERCLIS Site/Event Listing for the state of New Mexico. Seventeen are not located within DOE or DoD facilities and are potential offsite MWLID technology demonstration sites. Two of the seventeen CERCLIS sites, one on Native American land and one on municipal land, were evaluated and identified as potential candidates for off-site demonstrations of MWLID-developed technologies. Contaminants potentially present on site include chromium waste, household/commercial hazardous waste, volatile organic compounds, and petroleum products. MWLID characterization technologies applicable to these sites include Magnetometer Towed Array, Cross-borehole Electromagnetic Imaging, SitePlanner ™/PLUME, Hybrid Directional Drilling, Seamist™/Vadose Zone Monitoring, Stripping Analyses, and x-ray Fluorescence Spectroscopy for Heavy Metals.

16558 (SAND–95-0584C) **Prediction of single-component NAPL behavior for the TEVES Project using T2VOC.** Webb, S.W.; Phelan, J.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–2: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95009594. Source: OSTI; NTIS; INIS; GPO Dep.

Detailed simulations have been performed for the TEVES (Thermal Enhanced Vapor Extraction System) Project using the TOUGH2 code considering air, water, and a single-component NAPL. A critical parameter varied in the simulations is the borehole vacuum which directly affects air flow through the system and indirectly influences soil temperatures and water and NAPL fluid masses. Contaminant migration from the heated zone into the unheated soil can occur if the borehole vacuum, or borehole flow rate, is not sufficient. Under these conditions, evaporation of liquids (water and NAPL) due to the heating can cause flow from the heated zone into the unheated soil. Insufficient air sweep may be indicated by a vapor dominated mass flow rate into the borehole, at least for the present configuration. Sufficient air flow through the heated zone must be provided to contain the contaminants within the heated zone.

16559 (SKB-TR–94-17) **Summary report of the experiences from TVO's site investigations.** Oehberg, A. (Saanio and Reikkola Consulting Engineers, Helsinki (Finland)); Saksa, P.; Ahokas, H.; Ruotsalainen, P.; Snellman, M. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1994. 114p. Order Number DE95628653. Source: OSTI; NTIS; INIS.

Teollisuuden Voima Oy (TVO) has completed preliminary site investigations at five sites in Finland. At the end of 1992 TVO presented the final report to the authorities. The preliminary site investigation phase 1986-1992 was conducted according to the investigation programme compiled by TVO. The aim of this report was to compile a report on experiences from TVOs site investigations. The main interest was focused on investigation strategies and the most important investigation methods for the conceptual modelling. The objective of the preliminary site investigations was to obtain data on the bedrock properties in order to evaluate the areas. The programme was divided into four stages, each stage having its own sub-objective. The site-specific investigation programme for each site included a large common part and a small site-specific part. The strategies (objectives) and experiences from different disciplines, geology, hydrogeochemistry, geophysics and geohydrology, are presented in the report. The conceptual modelling work procedure including both bedrock and groundwater modelling is described briefly using the Olkiluoto site as an example. Each of the other areas has undergone similar phases of work. The uncertainties associated with conceptual modelling are also discussed. The usefulness of the investigation strategy and the investigation methods for conceptual modelling is discussed in the report. Some new equipment, methods or enhancements that have not yet been used in TVOs site investigations have become new tools in site characterisation and are briefly presented in the report. 52 refs, 35 figs, 1 tab.

16560 (SKB-TR–94-18) **AECL strategy for surface-based investigations of potential disposal sites and the development of a geosphere model for a site.** Whitaker, S.H. (AECL Research, Whiteshell Labs., Pinawa, MB (Canada)); Brown, A.; Davison, C.C.; Gascoyne, M.; Lodha, G.S.; Stevenson, D.R.; Thorne, G.A.; Tomsons, D. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1994. 108p. Order Number DE95626532. Source: OSTI; NTIS; INIS.

The objective of this report is to summarize AECL's strategy for surface-based geotechnical site investigations used in screening and evaluating candidate areas and candidate sites for a nuclear fuel waste repository and for the development of geosphere models of sites. The report is one of several prepared by national nuclear fuel waste management programs for the Swedish Nuclear Fuel and Waste Management Co. (SKB) to provide international background on site investigations for SKB's R and D programme on siting.The scope of the report is limited to surface-based investigations of the geosphere, those done at surface or in boreholes drilled from surface. The report discusses AECL's investigation strategy and the methods proposed for use in surface-based reconnaissance and detailed site investigations at potential repository sites. Site investigations done for AECL's Underground Research Laboratory are used to illustrate the approach. The report also discusses AECL's strategy for developing conceptual and mathematical models of geological conditions at sites and the use of these models in developing a model (Geosphere Model) for use in assessing the performance of the disposal system after a repository is closed. Models based on the site data obtained at the URL are used to illustrate the approach. Finally, the report summarizes the lessons learned from AECL's R and D program on site investigations and mentions some recent developments in the R and D program. 120 refs, 33 figs, 7 tabs.

16561 (SKB-TR–94-24) **Aespoe Hard Rock Laboratory - feasibility and usefulness of site investigation methods. Experiences from the pre-investigation phase.** Almen, K.E. (ed.) (KEA GEO-Konsult (Sweden)); Olsson, Paer; Rhen, I.; Stanfors, R.; Wikberg, P. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Aug 1994. 162p. Order Number DE95628654. Source: OSTI; NTIS; INIS.

One of the main goals set up by SKB for the Aespoe HRL project is to 'test the quality and appropriateness of different methods for characterizing the bedrock with respect to conditions of importance for a final repository'. An extensive investigation programme was carried out during the projects pre-investigation phase

that in part was based in experience from SKBs previous site investigations and in part entailed the testing of new or other unestablished methods. Previous technical reports have described the methods that have been used and the results, models and predictions that have been produced. All the methods used are discussed in the present report in terms of how they have contributed in different analysis stages to the total geoscientific characterization of the rock at Aespoe. The usefulness of each method for modelling and prediction in different scales is evaluated, and aspects of the practical execution of the methods under different conditions are discussed. The report sheds light on the importance of dividing large investigation programmes such as this one into suitable stages to get an opportunity to evaluate the results obtained and plan in detail the investigations in the next stage. Furthermore, the way in which the characterization/modelling work in different geometric scales has been done for the different investigation stages is discussed, along with whether this has been found to be a suitable approach. The importance of pursuing an interdisciplinary strategy throughout the pre-investigation process cannot be overemphasized. For the planning, execution, analysis and reporting of the results of the pre-investigations, this has been guaranteed by an organization in which an interdisciplinary group has been in charge of the investigations, together with the project manager. 52 refs, numerous tabs and figs.

16562 (UCRL-CR–119484) **Particle filtration: An analysis using the method of volume averaging.** Quintard, M. (L.E.P.T.-ENSAM (UA CNRS), Talence (France)); Whitaker, S. California Univ., Davis, CA (United States). Dept. of Chemical Engineering. Dec 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009467. Source: OSTI; NTIS; GPO Dep.

The process of filtration of non-charged, submicron particles is analyzed using the method of volume averaging. The particle continuity equation is represented in terms of the first correction to the Smoluchowski equation that takes into account particle inertia effects for small Stokes numbers. This leads to a cellular efficiency that contains a minimum in the efficiency as a function of the particle size, and this allows us to identify the most penetrating particle size. Comparison of the theory with results from Brownian dynamics indicates that the first correction to the Smoluchowski equation gives reasonable results in terms of both the cellular efficiency and the most penetrating particle size. However, the results for larger particles clearly indicate the need to extend the Smoluchowski equation to include higher order corrections. Comparison of the theory with laboratory experiments, in the absence of adjustable parameters, provides interesting agreement for particle diameters that are equal to or less than the diameter of the most penetrating particle.

16563 (UCRL-JC–115974) **Chemical and biological systems for regenerating activated carbon contaminated with high explosives.** Knezovich, J.P. (Lawrence Livermore National Lab., CA (United States)); Daniels, J.I.; Stenstrom, M.K.; Heilmann, H.M. Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411155–3: 1994 Luxembourg international symposium on the rehabilitation of military sites and demilitarization of explosive ordance, Kirchberg (Luxembourg), 14-18 Nov 1994). Order Number DE95009471. Source: OSTI; NTIS; GPO Dep.

Activated carbon has been used as a substrate for efficiently removing high explosives (HEs) from aqueous and gaseous waste streams. Carbon that is saturated with HEs, however, constitutes a solid waste and is currently being stored because appropriate technologies for its treatment are not available. Because conventional treatment strategies (i.e., incineration, open burning) are not safe or will not be in compliance with future regulations, new and cost-effective methods are required for the elimination of this solid waste. Furthermore, because the purchase of activated carbon and its disposal after loading with HEs will be expensive, an ideal treatment method would result in the regeneration of the carbon thereby permitting its reuse. Coupling chemical and biological treatment systems, such as those described below, will effectively meet these technical requirements. The successful completion of this project will result in the creation of engineered commercial systems that will present safe and efficient methods for reducing the quantities of HE-laden activated carbon wastes that are currently in storage or are generated as a result of demilitarization activities. Biological treatment of hazardous wastes is desirable because the biodegradation process ultimately leads to the mineralization (e.g., conversion to carbon dioxide, nitrogen gas, and water) of parent compounds and has favorable public acceptance. These methods will also be cost- effective because they will not require large expenditures of energy and will permit the reuse of the activated carbon. Accordingly, this technology will have broad applications in the private sector and will be a prime candidate for technology transfer.

16564 (UCRL-JC–118635) **A numerical simulation of groundwater flow and contaminant transport on the Cray T3D and C90 supercomputers.** Ashby, S.F.; Bosl, W.J.; Falgout, R.D.; Smith, S.G.; Tompson, A.F.B.; Williams, T.J. Lawrence Livermore National Lab., CA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410212–4: Cray user's group conference, Tours (France), 10-14 Oct 1994). Order Number DE95009876. Source: OSTI; NTIS; GPO Dep.

Numerical simulations of groundwater flow and chemical transport through three-dimensional heterogeneous porous media are described. The authors employ two Cray supercomputers for different parts of the decoupled calculation: the flow velocity field is computed on the T3D massively parallel computer and the contaminant migration is simulated on the C90 vector supercomputer. They compare simulation results for subsurface models using homogeneous layers and heterogeneous layers, and they see that the heterogeneities have a profound impact on contaminant migration.

16565 (VTT-TIED–1537) **The speciation of dissolved elements in aquatic solution. Radium and actinides.** Haesaenen, E. (VTT Chemical Technology, Espoo (Finland)). Technical Research Centre of Finland, Espoo (Finland). 1994. 44p. (In Finnish). Order Number DE95628646. Source: OSTI; NTIS; INIS.

In the publication, the chemistry and speciation of radium, thorium, protactinium, uranium, neptunium, lutonium, americium and curium in ground-water environment is reviewed. Special attention is given to the transuranium elements, which have a central role in the repository of nuclear wastes. The most important methods used in the speciation of these elements is presented. The laser-induced methods, developed in the 1980's, are especially discussed. These have made it possible, e.g., to speciate the transuranium elements in their very low, actual repository groundwater concentrations (10-100 ng/l). (54 refs., 10 figs., 3 tabs.).

16566 (VTT-TIED–1556) **The effect of thickness in the through-diffusion experiment.** Lehikoinen, J.; Uusheimo, K.; Valkiainen, M. Technical Research Centre of Finland, Espoo (Finland). 1994. 35p. Order Number DE95628647. Source: OSTI; NTIS; INIS.

The publication contains an experimental study of diffusion in the water filled pores of rock samples. The samples studied are rapakivi granite from Loviisa, southern Finland. The drill-core sample was sectioned perpendicularly with diamond saw and three cylinder formed samples were obtained. The nominal thicknesses (heights of the cylinders) are 2, 4 and 6 cm. For the diffusion measurement the sample holders were pressed between two chambers. One of the chambers was filled with 0.0044 molar sodium chloride solution spiked with tracers. Another chamber was filled with inactive solution. Tritium (HTO) considered to be water equivalent tracer and anionic ^{36}Cl were used as tracers. (9 refs., 19 figs., 2 tabs.).

16567 (WHC-SA–2755) **Testing of a benchscale Reverse Osmosis/Coupled Transport system for treating contaminated groundwater.** Hodgson, K.M.; Lunsford, T.R.; Panjabi, G. Westinghouse Hanford Co., Richland, WA (United States). Jan 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950646–2: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95005984. Source: OSTI; NTIS; INIS; GPO Dep.

The Reverse Osmosis/Coupled Transport process is a innovative means of removing radionuclides from contaminated groundwater at the Hanford Site. Specifically, groundwater in the 200 West Area of the Hanford Site has been contaminated with uranium, technetium, and nitrate. Investigations are proceeding to determine the most cost effective method to remove these contaminants. The process described in this paper combines three different membrane technologies (reverse osmosis, coupled transport, and nanofiltration to purify the groundwater while extracting and concentrating uranium, technetium, and nitrate into separate solutions. This separation allows for the future use of the radionuclides, if needed, and reduces the amount of waste that will need to be disposed of. This process has the potential to concentrate the contaminants into solutions with volumes in a ratio of 1/10,000 of the feed volume. This compares to traditional volume reductions of 10 to 100 for ion exchange and stand-alone reverse osmosis. The successful demonstration of this technology could result in significant savings in the overall cost of decontaminating the groundwater.

16568 (WHC-SD-EN-AP–093) **Site characterization for the W-049H Project.** Mitchell, R.M. Westinghouse Hanford Co., Richland, WA (United States). 25 Mar 1994. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010672. Source: OSTI; NTIS; INIS; GPO Dep.

Objective is to field characterize and sample the soil along the proposed effluent line routes for Project W-049H in the 200 East and West Area; overall plan is to discontinue the disposal of contaminated liquids into the Hanford soil column. General requirements (health, safety; prerequisites) sampling and field activities, quality assurance and quality control are discussed. The information from sampling will be used to determine the need for changes in the proposed routes prior to pipeline construction.

16569 (WHC-SD-EN-TP–032) **Integrated test plan for demonstration of a prompt fission neutron logging tool.** Koegler, K.J. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1993. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010673. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes the demonstration of the geophysical logging tool as part of the Volatile Organic Compounds Arid Sites Integrated Demonstration (VOC-Arid ID) and the Buried Waste Integrated Demonstration. Purpose is to show that the tool can log cased boreholes at Hanford waste sites for the presence in the soil of fissionable isotopes.

16570 (WHC-SD-EN-WP–012) **Groundwater monitoring plan: 200 Areas treated effluent disposal facility (Project W-049H).** Barnett, D.B.; Davis, J.D.; Collard, L.B.; Freeman, P.B.; Chou, C.J. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 230p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010111. Source: OSTI; NTIS; INIS; GPO Dep.

This groundwater monitoring plan provides information that supports the US Department of Energy's application (DOE-RL 1994) for waste water discharge permit No. WA-ST-4502 from the State of Washington, under the auspices of Washington Administrative Code 173-216. The monitoring plan has two functions: (1) to summarize the results of a 3-yr characterization of the current hydrogeology and groundwater quality of the discharge site and (2) to provide plans for evaluating the effects of the facility's operation on groundwater quality and document compliance with applicable groundwater quality standards. Three wells were drilled to define the stratigraphy, evaluate sediment characteristics, and establish a groundwater monitoring net work for the discharge facility. These wells monitor groundwater quality upgradient and downgradient in the uppermost aquifer. This report proposes plans for continuing the monitoring of groundwater quality and aquifer characteristics after waste water discharges begin.

16571 (Y/DZ–1124) **Thermal decomposition of mercuric sulfide.** Leckey, J.H.; Nulf, L.E. Oak Ridge Y-12 Plant, TN (United States). 28 Oct 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009062. Source: OSTI; NTIS; GPO Dep.

The rate of thermal decomposition of mercuric sulfide (HgS) has been measured at temperatures from 265 to 345 C. These data have been analyzed using a first-order chemical reaction model for the time dependence of the reaction and the Arrhenius equation for the temperature dependence of the rate constant. Using this information, the activation energy for the reaction was found to be 55 kcal/mol. Significant reaction vessel surface effects obscured the functional form of the time dependence of the initial portion of the reaction. The data and the resulting time-temperature reaction-rate model were used to predict the decomposition rate of HgS as a function of time and temperature in thermal treatment systems. Data from large-scale thermal treatment studies already completed were interpreted in terms of the results of this study. While the data from the large-scale thermal treatment studies were consistent with the data from this report, mass transport effects may have contributed to the residual amount of mercury which remained in the soil after most of the large-scale runs.

16572 (YJT–94-20) **The International INTRAVAL project. Summary and conclusions by the TVO/VTT Team.** Hautojaervi, A. (VTT Energy, Espoo (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1994. 26p. Order Number DE95626509. Source: OSTI; NTIS; INIS.

Teollisuuden Voima Oy (TVO) participated the international cooperation project INTRAVAL and VTT Energy acted as a project team. The Finnish participation focused on flow and transport in crystalline fractured rock and six test cases out of thirteen were tackled. The experimental results were evaluated mainly by means of analytical transport models. The report presents a short review of the experience obtained in the course of the project. It concentrates on the issues revealed in the discussions and analyses of the six test cases in which the TVO/VTT team actively participated but some of the conclusions are even more general in nature. Some suggestions are made for future experimental and theoretical work in the field of geosphere. (15 refs., 2 tabs.).

16573 (Y/SUB–28B-99920C/94-2) **Water balance report for the Oak Ridge Y-12 Plant.** Oak Ridge Y-12 Plant, TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Jul 1994. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009052. Source: OSTI; NTIS; GPO Dep.

The Y-12 Plant, which occupies approximately 800 acres, was built by the Army Corps of Engineers in 1943 as part of the Manhattan Project in Oak Ridge, Tennessee. Recently, Martin Marietta Energy Systems, who manages the Y-12 Plant, has been concerned with the effects of water consumption and losses at the plant facility, and the ability of ground water beneath the site to act as a source of water seepage into East Fork Poplar Creek or as a source of water infiltration into subsurface strata. This has prompted the need to perform a water balance study on the facility. Data regarding all uses of municipal water and sources of discharge from the plant were recorded and then water balance calculations were performed using a computer model developed in a multi-dimensional electronic spreadsheet. This report describes the results of this research and includes the flow data collected during the study.

16574 (Y/SUB–94-99069C/Y15/10/R1) **Site-specific standard request for underground storage tanks 1219-U, 1222-U, 2082-U, and 2068-U at the rust garage facility buildings 9754-1 and 9720-15: Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, Facility ID No. 0-010117.** Oak Ridge National Lab., TN (United States). Dec 1994. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009394. Source: OSTI; NTIS; GPO Dep.

This document represents a Site-specific Standard Request for underground storage tanks (USTs) 1219-U,1222-U and 2082-U previously located at former Building 9754-1, and tank 2086-U previously located at Building 9720-15, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee. The tanks previously contained petroleum products. For the purposes of this report, the two building sites will be regarded as a single UST site and will be referred to as the Rust Garage Facility. The current land use associated with the Y-12 Plant is light industrial and the operational period of the plant is projected to be at least 30 years. Thus, potential future residential

exposures are not expected to occur for at least 30 years. Based on the degradation coefficient for benzene (the only carcinogenic petroleum constituent detected in soils or groundwater at the Rust Garage Facility), it is expected that the benzene and other contaminants at the site will likely be reduced prior to expiration of the 30-year plant operational period. As the original sources of petroleum contamination have been removed, and the area of petroleum contamination is limited, a site-specific standard is therefore being requested for the Rust Garage Facility.

16575 (Y/SUB–94-99069C/Y15/12) **Site status monitoring report for underground storage tanks 1219-U, 1222-U, 2082-U, and 2068-U at the Rust Garage Facility, Buildings 9720-15 and 9754-1, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, Facility ID No. 0-010117.** Oak Ridge National Lab., TN (United States). Oct 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009039. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide hydrogeologic, geochemical, and vapor monitoring data required for site status monitoring of underground storage tanks (UST) 1219-U, 1222-U, 2082-U, and 2068-U at the Rust Garage Facility. Comprehensive monitoring was conducted at the site in May 1994 as part of a Monitoring Only program approved by Tennessee Department of Environment and Conservation (TDEC) based on review and approval of Site Ranking. This document presents the results of the first semiannual site status monitoring, which was conducted in September 1994. Site status monitoring and preparation of this report have been conducted in accordance with the requirements of the TDEC Rule 1200-1-15, the TDEC UST Reference Handbook, Second Edition, and direction from TDEC. This document is organized into three sections. Section 1 presents introductory information relative to the site including regulatory initiative and a site description. Section 2 includes the results of sampling of monitoring wells GW-508, GW-631, GW-632, and GW-634. Section 3 presents data from vapor monitoring conducted in subsurface utilities present at the site.

16576 (Y/SUB–94-EAQ10C/4) **Sampling and analysis plan for groundwater and surface water monitoring at the Y-12 Plant during calendar year 1995.** Oak Ridge Y-12 Plant, TN (United States); HSW Environmental Consultants, Inc., Oak Ridge, TN (United States). Oct 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009065. Source: OSTI; NTIS; INIS; GPO Dep.

This plan provides a description of the groundwater and surface-water quality monitoring activities planned for calendar year (CY) 1995 at the Department of Energy Y-12 Plant. Included in this plan are the monitoring activities managed by the Y-12 Plant Health, Safety, Environment, and Accountability (HSEA) Organization through the Y-12 Plant Groundwater Protection Program (GWPP). Other groundwater and surface water monitoring activities (e.g. selected Environmental Restoration Program activities, National Pollution Discharge Elimination System (NPDES) monitoring) not managed through the Y-12 Plant GWPP are not addressed in this report. Several monitoring programs will be implemented in three hydrogeologic regimes: the Bear Creek Hydrogeologic Regime (Bear Creek Regime), the Upper East Fork Poplar Creek Hydrogeologic Regime (East Fork Regime), and the Chestnut Ridge Hydrogeologic Regime (Chestnut Ridge Regime). The Bear Creek and East Fork regimes are located within Bear Creek Valley, and the Chestnut Ridge Regime is located south of the Y-12 Plant. For various reasons, modifications to the 1995 monitoring programs may be necessary during implementation. For example, changes in regulatory requirements may alter the parameters specified for selected wells, or wells could be added to or deleted from the monitoring network. All modifications to the monitoring programs will be approved by the Y-12 Plant GWPP manager and documented as addenda to this sampling and analysis plan.

16577 (Y/TS–1001) **Chemical characteristics of waters in Karst Formations at the Oak Ridge Y-12 Plant.** Shevenell, L.A. (Univ. of Nevada, Reno, NV (United States). Nevada Bureau of Mines and Geology). Oak Ridge National Lab., TN (United States). Nov 1994. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009405. Source: OSTI; NTIS; INIS; GPO Dep.

Several waste disposal sites are located adjacent to or on a karst aquifer composed of the Cambrian Maynardville Limestone (Cmn) and the Cambrian Copper Ridge Dolomite (Ccr) at the U.S. Department of Energy Oak Ridge Y-12 Plant in Oak Ridge, TN. Highly variable chemical characteristics (i.e., hardness) can indicate that the portion of the aquifer tapped by a particular well is subject to a significant quick-flow component where recharge to the system is rapid and water levels and water quality change rapidly in response to precipitation events. Water zones in wells at the Y-12 Plant that exhibit quick-flow behavior (i.e., high hydraulic conductivity) are identified based on their geochemical characteristics and variability in geochemical parameters, and observations made during drilling of the wells. The chemical data used in this study consist of between one and 20 chemical analyses for each of 102 wells and multipart monitoring zones. Of these 102 water zones, 10 were consistently undersaturated with respect to calcite suggesting active dissolution. Repeat sampling of water zones shows that both supersaturation and undersaturation with respect to dolomite occurs in 46 water zones. Twelve of the zones had partial pressure of CO_2 near atmospheric values suggesting limited interaction between recharge waters and the gases and solids in the vadose zone and aquifer, and hence, relatively short residence times. The preliminary data suggest that the Cmn is composed of a complicated network of interconnected, perhaps anastomosing, cavities. The degree of interconnection between the identified cavities is yet to be determined, although it is expected that there is a significant vertical and lateral interconnection between the cavities located at shallow depths in the Cnm throughout Bear Creek Valley and the Y-12 Plant area.

16578 (Y/TS–1264) **Insights into quick flow in a karst aquifer: Usefulness of infrequently collected geochemical data from wells.** Shevenell, L.A. (Univ. of Nevada, Reno, NV (United States). Nevada Bureau of Mines and Geology). Oak Ridge National Lab., TN (United States). Nov 1994. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009058. Source: OSTI; NTIS; GPO Dep.

Highly variable chemical characteristics (e.g., hardness) can indicate that a portion of a karst aquifer sampled by a well is subject to a quickflow component where water flow is rapid and water quality changes rapidly in response to precipitation events. Typically, karst aquifer monitoring for both water level and geochemistry is conducted at frequent intervals (hourly, daily) due to the nature of rapid geochemical and hydrologic changes in association with storm events. Quarterly monitoring data are available at the U.S. Department of Energy Oak Ridge Y- 12 Plant in Oak Ridge, TN, and these data are evaluated to identify quickflow portions of the aquifer. Values of P_{CO_2} near atmospheric suggest rapid recharge of fluids, and 12 of 99 well waters exhibited P_{CO_2} near atmospheric. Waters saturated with respect to dolomite must have relatively long residence times because attainment of saturation requires tens to hundreds of years. Repeat sampling of waters shows that both supersaturation and undersaturation with respect to dolomite occurs in 46 wells, indicating that relatively old waters diffusing from the rock matrix into conduits during baseflow experience periodic flushing by more rapidly recharged waters. Undersaturation with respect to calcite indicates active dissolution and may suggest short residence times because calcite saturation can be expected to occur on the order of days. Evaluation of a_{Mg}/a_{Ca} ratios in the waters allows identification of portions of the aquifer where flow occurs from a dolomite to a limestone, and vice versa. In addition, 30 well waters exhibited coefficients of variation of hardness >10%. Hence, quickflow was identified in association with numerous well waters even though only quarterly monitoring data were available.

Area Energia Ambiente e Salute); Lenzi, G.; Mazzone, N.; Moretti, L.; Olivieri, P.; Tesini, E.; Valpreda, E.M.; Vincenzi, D.; Anselmi, B.; Bucci, M.; Paris, P.; Quercia, F. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Dec 1992. 67p. (In Italian). (RT/AMB–92-21). Order Number DE95771050. Source: OSTI; NTIS (US Sales Only).

This work deals with the analysis of seepage through the Comacchio wetland, the phreatic aquifer and the neighbouring drainage canals over an area of 400 km^2. To this aim, a monitoring network of 76 wells and 50 piezometers to measure hydraulic head, conductivity and ph of groundwater was positioned. Over this network ten field-surveys were carried out, from december 1988 to november 1990. On the basis of elaborated data and of the simulation produced by grounwater mathematical model, it was verified that: the Comacchio water body exchanges little quantities of water with the phreatic aquifer and with its neighbouring canals, with respect to its total volume; the amount of seepage between canals and phreatic aquifer in the drained area is quite relevant, as confirmed in the hydrological balance; the combined effect of the artificial drainage of the reclaimed terrains and of seepage of the saltwater from the Comacchio wetland to the near terrains leads to the growth of the groundwater salinity with damage to the crops; the calibrated model reproduced with a good approximation the observed groundwater levels; this result may represent a useful support to water quality studies that may be carried out in the future.

16580 (ENEA-RT-AMB–94-26) **Removal of ammonia from wastewaters by natural zeolites as ion exchanging.** Fabiani, C. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Rosati, A.; Pande, D.R.; Ruscio, F. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Dec 1994. 18p. (In Italian). (RT/AMB–94-26). Order Number DE95771022. Source: OSTI; NTIS (US Sales Only).

The use of zeolites as ion exchanging or adsorbing materials for the wastewaters, polluted waters and gas mixtures is an up to date research field in environmental technologies. The performances of a naturally occuring zeolite, the neapolitan yellow stuff (NYT), are examined with the purpose of using this material to remove ammonia from wastewaters. The considered wastewaters are produced as a filtrate when sludges of a anaerobic biological treatment plant are dewatered in a filterpress unit. These wastewaters, which have a very high ammonia content, could be recycled in the plant if the ammonia concentration could be reduced to prevent inhibition of the microorganisms activity.

16581 (FEMP/SUB–080) **Electrofishing survey of the Great Miami River, September 1994 Annual Report.** Stocker, L.E. (Univ. of Cincinatti, OH (United States). Dept. of Biological Science); Miller, M.C.; Evans, R.L.; Koch, R.W. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. Jan 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. Order Number DE95009020. Source: OSTI; NTIS; INIS; GPO Dep.

Fish sampling by electroshocking in the Great Miami River upstream and downstream the Fernald site (September 25 and 26, 1994) was designed to determine changes in the health of the fish community compared to the previous ten years and to collect samples for uranium analyses in fish fillets. Samples of 853 fish, from 27 species, eight families and three sites at river mile (RM) 38, RM 24, and RM 19 provided seventy-eight samples for uranium analyses by an independent laboratory. The biomass of fish caught per hour was greatest at RM 24 > RM 19 > RM 3 8. The diversity index and the heaviest fish community was RM 24 > RM 38 > RM 19. The pooled site at RM 38 near Hamilton was diagnostically separated from the other sites by the young-of-the-year (YOY) golden redhorse, smallmouth bass and golden shiner. The darns at Hamilton acted as an effective barrier against fish migration upriver. Larger freshwater drum, gizzard shad, channel catfish and flathead catfish, which might be expected in rapid current reaches of mid-sized rivers characterize RM 24. The pool at RM 19 was distinguished from the others by YOY gizzard shad, bluegill, and longear sunfish. Thus the fish community in 1994 was separated ecologically by the physical features of the habitat more than by water quality differences between sites. These data suggest that the Fernald effluents in September were having no detectable effects on the distribution of fishes, independent of changes in habitat quality separated on physical attributes of the river channel at each site.

16582 (GTK-YST–85, pp. 89-97) **Uranium in surficial deposits and waters at Palmottu.** Ahonen, L. (Geological Survey of Finland, Espoo (Finland)); Blomqvist, R.; Ervanne, H.; Suksi, J.; Jaakkola, T. Geological Survey of Finland, Espoo (Finland). 1994. In *The Palmottu Analogue Project, Progress Report 1993. The behaviour of natural radionuclides in and around uranium deposits, Nr. 7.* 97p. Order Number DE95628645. Source: OSTI; NTIS; INIS.

Occurrence of uranium in surficial formations in the vicinity of an underground U deposit was studied. Several water samples from the Lake Palmottu and nearby springs, three lake sediment cores and three peat cores were collected for the study. Uranium concentrations in the water samples varied from 1.4 to 6.9 mBq/l, reflecting the average concentration of near-surface waters in Finland. In some samples, however, the $^{234}U/^{238}U$ activity ratio and water chemistry suggest a partial mixing with deeper groundwaters. In the lake sediments, uranium concentrations increases from 53 Bq/kg in surface layer to five fold in the bottom layers deposited 9000 years ago. In peat cores large variations in uranium concentrations can be observed: from tens of Bq/kg to over 20 kBq/kg of peat ash. The large variation also in the $^{234}U/^{238}U$ activity ratio, from 0.79 to l.91, tends to indicate uranium migration to the peat from more than one uranium source. (orig.) (19 refs., 5 figs., 1 tab.).

16583 (GTK-YST–87) **Hydraulic measurements at Palmottu in 1994.** Ahonen, L.; Lampinen, P. Geological Survey of Finland, Espoo (Finland). 1995. 38p. (In Finnish). Order Number DE95628660. Source: OSTI; NTIS; INIS.

The report describes the results of hydraulic measurements carried out during 1994 at the Palmottu site, Nummi-Pusula. The purpose of the work was to study the hydraulic conductivity and its variation in fractured crystalline bedrock and, consequently, to adjust and ascertain the preliminary hydrogeological model, which was based on earlier geophysical, structural, and hydrogeological studies. The following hydrogeological measurements were done: (1) Slug-tests were made in one drill hole using a double-packer device. The method allows the hydraulic conductivity of the bedrock at a certain depth interval of a drill hole to be measured. (2) Spinner-measurements were made in five drill holes, together with monitoring of water-tables in surrounding drill holes. By this method, the most important hydraulic conductors penetrated by a drill hole were found. Contemporaneous monitoring of the surrounding drill holes gave information on the possible hydraulic connections between drill holes. (3) Water-loss tests were made during drilling of a new hole when intensively fractured sections were observed, and hydraulic conductivity of the sections were estimated. (6 refs., 19 figs., 3 tabs.).

16584 (INIS-mf–14523) **Application of the nuclear gages in dynamic sedimentology for the solid transport study.** Lamdasni, Y. Centre National de l'Energie, des Sciences et des Techniques Nucleaires (CNESTEN), Rabat (Morocco). Feb 1994. 61p. (In French). Order Number DE95627765. Source: OSTI; NTIS (US Sales Only); INIS.

The problems caused by the solid particle transport in rivers, dams, harbors, estuaries and in navigation channels have considerable economical consequences. The technical difficulties met when trying to limit or manage these problems are very important because of lack of knowledge. The nuclear gages and the radioactive tracers can be the measurement and monitoring means which, associated to the conventional techniques, permit to develop strongly the knowledge in the solid transport field. This report gives the modes of solid transport and the problems caused by these transports and exposes the physical properties of the fine sediments and their behavior under the hydrodynamic effects. In the same way, it deals with the theory of the nuclear gages, often applied in dynamic sedimentology and gives some examples of their applications. 29 refs., 35 figs., 5 tabs. (F.M.).

16585 (LUNBDS-NBKE–95-1007) **Methyl mercury in lakes. Factors affecting its production and partitioning between water**

and sediment. Regnell, O. Lund Univ. (Sweden). Dept. of Ecology. Mar 1995. 122p. Order Number DE95766669. Source: OSTI; NTIS.

Radio-labelled inorganic Hg^{2+}(^{203}Hg) was added to the water of microcosms containing lake sediment and water. Anaerobic incubation always resulted in concentrations of radio-labelled methyl mercury in the water at least one order of magnitude higher than did aerobic incubation. This was explained by both Hg methylation activity and release of Hg from sediment under anaerobic conditions. Determination of phospholipid fatty acids (PFLAs) in sediment from a lake polluted with Hg and cellulose fibers, revealed a strong correlation between the concentration of the Methyl-branched fatty acid 10Me16:0 and Hg methylation. This PLFA is characteristic of Desulfobacter. There was an equally strong correlation with Cobalamin. These relationships support the idea that Hg methylation in microorganisms is the result of biochemical pathways, involving Methyl Cobalamin, designed to methylate substrates other than Hg^{2+}. A study in a meso-eutrophic lake corroborated most of the results obtained in the microcosm studies. It was found that CH_3Hg was released from sediment to water when the interface was anoxic, whereas an upper, oxidized sediment layer prevented such release. This redox controlled release probably contributed to the inverse relationship between the concentration of CH_3Hg in the sediment surface and in the water. Since the concentration of Manganese in the water showed the same variation as the concentration of CH_3Hg, it was concluded that Manganese (Mn^{4+}) oxides control the water solubility and release of CH_3Hg from sediment to water. Consequently, when Mn-oxides dissolve under anaerobic conditions, due to reduction of Mn^{4+} to Mn^{2+}, CH_3Hg is simultaneously released. The amplitude of change in the total amount of CH_3Hg was 5-10 times larger in the water mass than in the sediment surface (down to 5mm). 84 refs, 5 figs

16586 (NEI-DK–1945) **Atmospheric deposition of nitrogen. The Nation-Wide Danish Monitoring Programme 1993.** Faglig rapport fra DMU, 123. Skov, H.; Hovmand, M.F.; Grundahl, L.; Runge, E.H.; Kemp, K.; Aistrup, W.; Heidam, N.Z. Danmarks Miljoeundersoegelser, Roskilde (Denmark). 1994. 61p. (In Danish). Order Number DE95772347. Source: OSTI; NTIS.

'The Nation-wide Danish Monitoring Programme' assembles information on nutrient input to Danish aquatic systems. Atmospheric nitrogen input to the Danish marine waters is dealt with, focusing on the nitrogen input to the Kattegat and to the Danish straits, sounds and fjords, a total sea surface area of 44,000 km^2. Measurement performed in 1989-90 indicated that atmospheric input accounts for 25%-33% of the total inorganic nitrogen load to the Kattegat and Danish straits. Measurements from 1992/1993 showed that atmospheric deposition accounts for ca. 33% of the inorganic nitrogen input. Wet deposition is sampled at 16 locations, including 7 coastal or island-based, and 6 gas and aerosol monitoring stations. Special attention is given to measurements of gaseous ammonia, nitric acid and the ammonium and nitrate contents of aerosols and precipitation. In 1993 the sum of the wet and dry deposition to the Kattegat was 0.80 tonnes nitrogen per km^2, the deposition to the Belts and western part of the Baltic Sea is 1.2 tonnes nitrogen per km^2. Total deposition load of nitrogen to the inner seas (44,000 km^2) is ca. 41,000 ton N in 1993 and ca. 90% of total deposition is wet deposition. Dry deposition of nitrogen contributes a minor part of total deposition. Daily measurements of gases and aerosols during 1989/1993 reveal long-range transport of most pollutants, with the exception of ammonia and ammonium. These components have Danish agricultural sources. Agriculture appears to be the most important source of nitrogen pollution. (AB) (15 refs.)

16587 (NIRS-R–25, pp. 10-13) **Concentration of technetium-99 in marine environment.** Hirano, Shigeki (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Seawater and brown algae have been collected along the coast of Ibaraki Prefecture. Technetium-99 was preconcentrated from seawater by anion exchange resin, Bio-rad AG1-X8, C1-form, 50-100 mesh, and was extracted by 30% tri-n-octylamine (TOA) : xylene solution, followed by back-extraction with 5MNaOH solution. Technetium-99 was re-extracted into 2-butanone which was removed by rotary evaporator. The residue was dissolved in diluted sulfuric acid solution, in which 20mg of cupric ion was added. Technetium-99 was co-precipitated with cupric ion carrier as TcS by adding a thioacetamide solution. Algae were dried and ignited in an electric furnace at 450degC for 36h. The ash were digested with 4N nitric acid solution on a hot plate to leach technetium-99 into the nitric acid solution. The solution was centrifuged and the supernatant was processed by liquid extraction with 30% TOA-xylene solution as in the analysis of seawater. Among several species of brown algae, the highest concentration of technetium-99 was obtained in Sargassum thunbergii, which was found to be a useful indicator of technetium-99 in marine environment. (author).

16588 (ORNL/CDIAC–75) **Carbon dioxide concentrations in surface water and the atmosphere during 1986–1989 NOAA/PMEL cruises in the Pacific and Indian Oceans.** Murphy, P.P. (National Oceanic and Atmospheric Administration, Seattle, WA (United States). Pacific Marine Environmental Lab.); Kelly, K.C.; Feely, R.A.; Gammon, R.H.; Kozyr, A. Oak Ridge National Lab., TN (United States). Jan 1995. 197p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (NDP–047). Order Number DE95009659. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 4349.

The carbonate system in seawater is one of the most complex and important topics in oceanography. The system has long interested many oceanographers from various fields because it plays a major role in all three subspheres of the earth (biosphere, lithosphere, and hydrosphere). Carbon dioxide is a soluble gas that dissolves in sea water. As a result, the oceans are a potential sink for the CO_2, produced by the burning of fossil fuels, and we seek to understand the role of the World Ocean in regulating atmospheric levels of CO_2. With refined determinations for the various dissociation constants of carbonic and boric acids in seawater and the advances in sophisticated instrumentation for measuring the carbonate parameters, our knowledge of the CO_2-carbonate system of the ocean has rapidly increased. Extensive oceanographic investigations have been carried out in the World Ocean. Those extensive studies, especially in physical oceanography, have provided an excellent foundation for other types of study, such as that of the CO_2-carbonate system. This document presents the results of quasi-continuously measured CO_2 concentrations in surface water and the atmosphere during 5 Pacific Marine Environmental Laboratory cruises in the Pacific and Indian Oceans.

16589 (PNL-SA–24505) **Abiotic reduction of aquifer materials by dithionite: A promising in-situ remediation technology.** Amonette, J.E. (Pacific Northwest Lab., Richland, WA (United States)); Szecsody, J.E.; Schaef, H.T.; Gorby, Y.A.; Fruchter, J.S.; Templeton, J.C. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–22: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007812. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory batch and column experiments were conducted with Hanford sediments to develop the capability to predict (1) the longevity of dithionite in these systems, (2) its efficiency as a reductant of structural iron, and (3) the longevity and reactivity of the reduced iron with soluble inorganic and organic species. After an initial induction period, the loss of dithionite by disproportionation and oxidation could be described by pseudo-first-order (PFO) kinetics. Other than the initial reaction with ferric iron, the primary factor promoting loss of dithionite in this system was disproportion nation via heterogeneous catalysis at mineral surfaces. The efficiency of the reduction of structural iron was nearly 100% for the first fourth of the ferric iron, but declined exponentially with higher degrees of reduction so that 75% of the ferric iron could be reduced. This decrease in reduction efficiency probably was related to differences in the accessibility of ferric iron in the mineral particles, with iron in

clay-sized particles being the most accessible and that in silt- and sand-sized particles less accessible. Flow-through column studies showed that a reduced-sediment barrier created in this manner could maintain a reducing environment.

16590 (SVF–537) **Pre-treatment of surface water for production of make-up water with membrane technology.** Ramsbaeck, B. (AaF-Eneergikonsult Stockholm AB, (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995. 69p. (In Swedish). Project Vaermeforsk-K1-101. Order Number DE95766644. Source: OSTI; NTIS.

To demineralize make-up water by using membrane technique, instead of, or in combination with, ion exchange technique becomes more and more common. Equipment for Reverse Osmosis (RO) is an interesting alternative in many applications. An investigation on site with a pilot plant equipment for RO has been accomplished in three industrial plants. The waters that have been treated in the different plants have varying qualities. One is a lake water, rich in humus, one is a subsoil water and one is a local water with a normal content of sodium but moderate content of humus and silica. The results have shown that the best conditions for operating with RO-equipment are when the incoming water has drinking water quality. Local waters have been very favourable from operating view. Humus rich waters give a strongly contaminated membrane that makes regular washing necessary. A high content of silica in a local water can be taken care of with a good reduction and without noticeable pluggings in the membrane. When producing make-up water for steam plants, softening of the water before the RO-equipment, is recommended. The quality of the produced pearmeat is equivalent in all applications irrespective of the quality of the incoming water. Sodium-, humus- and silica content is reduced with a specific percentage of the content in the raw- and the pure water. The reduction is mostly 95-99%. 6 figs, 11 tabs

16591 (UCRL-ID–120471) **Retardation of volatile organic compounds in ground water in low organic carbon sediments.** Hoffman, F. Lawrence Livermore National Lab., CA (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009541. Source: OSTI; NTIS; INIS; GPO Dep.

It is postulated that adsorption onto aquifer matrix surfaces is only one of the processes that retard contaminants in ground water in unconsolidated sediments; others include hydrodynamic dispersion, abiotic/biotic degradation, matrix diffusion, partitioning to organic carbon, diffusion into and retention in dead-end pores, etc. This work aims at these processes in defining the K_d of VOCs in sediments with low organic carbon content. Experiments performed include an initial column experiment for VOC (TCE and perchloroethylene(PCE)) retardation tests on geological materials, PCE and TCE data from LLNL sediments, and a preliminary multilayer sampler experiment. The VOC K_ds in low organic carbon permeable aquifer materials are dependent on the VOC composition and independent of aquifer grain size, indicating that sorption was not operative and that the primary retarding factors are diffusion controlled. The program of future experiments is described.

16592 (UCRL-JC–120466) **A methodology for assessing the impact of mutagens on aquatic ecosystems. Final report.** Knezovich, J.P.; Martinelli, R.E. Lawrence Livermore National Lab., CA (United States). Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9408227–1: 45. annual American Institute of Biological Sciences (AIBS) meeting, Knoxville, TN (United States), 7-11 Aug 1994). Order Number DE95009044. Source: OSTI; NTIS; INIS; GPO Dep.

Assessments of impacts of hazardous agents (i.e., chemical and physical mutagens) on human health have focused on defining the effects of chronic exposure on individuals, with cancer being the main effect of concern. In contrast, impacts on ecosystems have traditionally been gauged by the assessment of near-term organism mortality, which is clearly not a useful endpoint for assessing the long-term effects of chronic exposures. Impacts on individual organisms that affect the long-term survival of populations are much more important but are also more difficult to define. Therefore, methods that provide accurate measures of sub-lethal effects that are linked to population survival are required so that accurate assessments of environmental damage can be made and remediation efforts, if required, can be initiated. Radioactive substances have entered aquatic environments as a result of research and production activities, intentional disposal, and accidental discharges. At several DOE sites, surface waters and sediments are contaminated with radioactive and mutagenic materials. The accident at the Chernobyl power station in the former Soviet Union (FSU) has resulted in the contamination of biota present in the Kiev Reservoir. This documents presents a methodology which addresses the effects of a direct-acting mutagen (radiation) on aquantic organisms by applying sensitive techniques for assessing damage to genetic material.

16593 (VTT-PUB–184) **Modeling flow in fractured medium. Uncertainty analysis with stochastic continuum approach.** Niemi, A. (VTT Communities and Infrastructure, Espoo (Finland)). Technical Research Centre of Finland, Espoo (Finland); Helsinki Univ. of Technology, Espoo (Finland). 1994. 201p. Order Number DE95628661. Source: OSTI; NTIS; INIS.

For modeling groundwater flow in formation-scale fractured media, no general method exists for scaling the highly heterogeneous hydraulic conductivity data to model parameters. The deterministic approach is limited in representing the heterogeneity of a medium and the application of fracture network models has both conceptual and practical limitations as far as site-scale studies are concerned. The study investigates the applicability of stochastic continuum modeling at the scale of data support. No scaling of the field data is involved, and the original variability is preserved throughout the modeling. Contributions of various aspects to the total uncertainty in the modeling prediction can also be determined with this approach. Data from five crystalline rock sites in Finland are analyzed. (107 refs., 63 figs., 7 tabs.).

16594 (YJT–94-04) **Groundwater flow analyses in preliminary site investigations. Modelling strategy and computer codes.** Taivassalo, V. (VTT Energy, Espoo (Finland)); Koskinen, L.; Meling, K. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Feb 1994. 97p. Order Number DE95626548. Source: OSTI; NTIS; INIS.

The analyses of groundwater flow comprised a part of the preliminary site investigations which were carried out by Teollisuuden Voima Oy (TVO) for five areas in Finland during 1987 -1992. The main objective of the flow analyses was to characterize groundwater flow at the sites. The flow simulations were also used to identify and study uncertainties and inadequacies which are inherent in the results of earlier modelling phases. The flow analyses were performed for flow conditions similar to the present conditions. The modelling approach was based on the concept of an equivalent continuum. Each fracture zone and the rock matrix among the zones was, however, considered separately as a hydrogeologic unit. The numerical calculations were carried out with a computer code package, FEFLOW. The code is based upon the finite element method. With the code two- and one-dimensional elements can also be used by way of embedding them in a three-dimensional element mesh. A set of new algorithms was developed and employed to create element meshes for FEFLOW. The most useful program in the preliminary site investigations was PAAWI, which adds two-dimensional elements for fracture zones to an existing three-dimensional element mesh. The new algorithms reduced significantly the time required to create spatial discretization for complex geometries. Three element meshes were created for each site. The boundaries of the regional models coincide with those of the flow models. (55 refs., 40 figs., 1 tab.).

16595 (YJT–94-18) **Numerical study on the effects of the alternative structure geometries on the groundwater flow at the Romuvaara site.** Koskinen, L. (VTT Energy, Espoo (Finland)); Meling, K. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Nov 1994. 57p. Order Number DE95626549. Source: OSTI; NTIS; INIS.

The work has two aims. Firstly, it completes the numerical modelling work for the groundwater flow at the Romuvaara site in Finland performed during the preliminary site investigations by varying geometries of the most significant fracture zones. The modified fracture zone geometries are selected within the uncertainties of the structure of the bedrock model. Secondly, the work

studies the effects of several potential fracture zones. The locations and geometries of these zones are decided in such a way that either they offer potential or alternative hydrogeologic connections that would explain the anomalies in the results of the earlier field investigations or their existence has been implied by geophysical studies. The field results comprise the measured hydraulic head values under the natural conditions in boreholes KR1 -KRS, and the hydraulic head responses in the pumping test. The work employs the calibrated flow model developed in the preliminary site investigations as the base case, that is modified to correspond to the alternative geometries. Before the simulations with the alternative geometries, the boundary condition for the top of the flow model is partly changed in this work in order to revoke the modification motivated by incorrect field data that were used in the calibration of the flow model. (25 refs., 27 figs., 1 tab.).

16596 (YJT–94-19) **WELL-94: a stylized well scenario for indicative dose assessment of deep repositories.** Vieno, T. (VTT Energy, Espoo (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1994. 15p. Order Number DE95626536. Source: OSTI; NTIS; INIS.

WELL-94 is a stylized well scenario aimed to be used as an indicator in assessing the performance of the near-field and geosphere barriers of a deep repository for nuclear waste. It converts the release rates of radionuclides from the repository into the geosphere or from the geosphere into the biosphere into a dose rate. The scenario is based on an assumption that the annual releases from the repository into the biosphere are diluted in 100 000 m^3 of water and an individual drinks 500 litres of contaminated water per year. Drinking of water is the only exposure pathway considered. (12 refs., 4 tabs.).

55 BIOMEDICAL SCIENCES, BASIC STUDIES

16597 (DOE/ER/25054–T2) **A broad research program on the sciences of complexity. Final report.** Santa Fe Inst., NM (United States). [1994]. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER25054. Order Number DE95010178. Source: OSTI; NTIS; GPO Dep.

This report provides a summary of many of the research projects completed by the Santa Fe Institute (SFI) during the period January 1 to May 15, 1994. These research efforts continue to focus on two general areas: the study of, and search for, underlying scientific principles governing complex adaptive systems, and the exploration of new theories of computation that incorporate natural mechanisms of adaptation (mutation, genetics, evolution).

16598 (DOE/ER/25054–T3) **1993 Annual report on scientific programs: A broad research program on the sciences of complexity.** Santa Fe Inst., NM (United States). [1993]. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER25054. Order Number DE95010179. Source: OSTI; NTIS; GPO Dep.

This report provides a summary of many of the research projects completed by the Santa Fe Institute (SFI) during 1993. These research efforts continue to focus on two general areas: the study of, and search for, underlying scientific principles governing complex adaptive systems, and the exploration of new theories of computation that incorporate natural mechanisms of adaptation (mutation, genetics, evolution).

16599 (CONF-941241–Absts.) **Prediction method abstracts.** Lawrence Livermore National Lab., CA (United States). [1994]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. From Critial assessment of techniques for protein structure prediction; Asilomar, CA (United States); 4-8 Dec 1994. Order Number DE95009628. Source: OSTI; NTIS; GPO Dep.

This conference was held December 4–8, 1994 in Asilomar, California. The purpose of this meeting was to provide a forum for exchange of state-of-the-art information concerning the prediction of protein structure. Attention if focused on the following: comparative modeling; sequence to fold assignment; and ab initio folding.

16600 (CONF-950226–30) **Optical melting as a tool for optimizing SBH analysis of DNA.** Doktycz, M.J. (Oak Ridge National Lab., TN (United States)); Jacobson, K.B.; Foote, R.S.; Beattie, K.L. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States);National Insts. of Health, Bethesda, MD (United States). DOE Contract AC05-84OR21400. Grant 1 P20 HG00666. From SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine; San Jose, CA (United States); 5-10 Feb 1995. Order Number DE95009032. Source: OSTI; NTIS; GPO Dep.

Sequencing by hybridization is a technique that relies on the specific hybridization properties of nucleic acids to derive sequence information. Hybridization properties are highly dependent on the DNA sequence and the solution environment. Identification of the optimal SBH conditions can be obtained by optical melting. By optical melting of 128 octamer pairs that have the appropriate choice of nucleic acid structures, a useful model of stability has been obtained which will aid in the design and implementation of SBH assays.

16601 (DOE/ER/20044–T2) **Role of pectolytic enzymes in the programmed separation of cells from the root cap of higher plants. Final report.** Hawes, M.C. Arizona Univ., Tucson, AZ (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER20044. Order Number DE95008630. Source: OSTI; NTIS; GPO Dep.

The objective of this research was to develop a model system to study border cell separation in transgenic pea roots. In addition, the hypothesis that genes encoding pectolytic enzymes in the root cap play a role in the programmed separation of root border cells from the root tip was tested. The following objectives have been accomplished: (1) the use of transgenic hairy roots to study border cell separation has been optimized for Pisum sativum; (2) a cDNA encoding a root cap pectinmethylesterase (PME) has been cloned; (3) PME and polygalacturonase activities in cell walls of the root cap have been characterized and shown to be correlated with border cell separation. A fusion gene encoding pectate lyase has also been transformed into pea hairy root cells.

16602 (LBL–36333) **Low density lipoprotein subclasses and response to a low-fat diet in healthy men.** Krauss, R.M. (Lawrence Berkeley Lab., CA (United States). Life Sciences Div.); Dreon, D.M. Lawrence Berkeley Lab., CA (United States). Nov 1994. 38p. Sponsored by USDOE, Washington, DC (United States);National Insts. of Health, Bethesda, MD (United States);National Dairy Council, Rosemont, IL (United States). DOE Contract AC03-76SF00098. Grant HL 18574. (CONF-9404251–1: Federation of Americal Societies for Experimental Biology (FASEB) symposium, Anaheim, CA (United States), 24-28 Apr 1994). Order Number DE95008497. Source: OSTI; NTIS; GPO Dep.

Lipid and lipoprotein response to reduced dietary fat intake was investigated in relation to differences in distribution of LDL subclasses among 105 healthy men consuming high-fat (46%) and low-fat (24%) diets in random order for six weeks each. On high-fat, 87 subjects had predominantly large, buoyant LDL as measured by gradient gel electrophoresis and confirmed by analytic ultracentrifugation (pattern A), while the remainder had primarily smaller, denser LDL (pattern B). On low-fat, 36 men changed from pattern A to B. Compared with the 51 men in the stable A group, men in the stable B group (n = 18) had a three-fold greater reduction in LDL cholesterol and significantly greater reductions in plasma apoB and mass of intermediate (LDL II) and small (LDL III) LDL subtractions measured by analytic ultracentrifugation. In both stable A and change groups, reductions in LDL-cholesterol were not accompanied by reduced plasma apoB, consistent with the observation of a shift in LDL particle mass from larger, lipid-enriched (LDL I and II) to smaller, lipid-depleted (LDL III and IV) subfractions, without significant change in particle number. Genetic and environmental factors influencing LDL subclass distributions

thus may also contribute substantially to interindividual variation in response to a low-fat diet.

This volume of abstracts represents the main publication of the XVIIth International Congress of Genetics. It contains summaries of: The invited Plenary and symposia papers; abstracts of the Public Awareness presentations; and contributions from delegates. Topics discussed include; genetic engineering and mapping, DNA repair proteins, gene mutations, and gene recombination.

16605 (DOE/ER/10873–T2) **The roles played by mitochondrial DNA and nuclear genes in reversion to fertility in S-Type male-sterile maize. Progress report, April 1, 1985–March 31, 1989.** Laughnan, J.R. Illinois Univ., Urbana, IL (United States). Dept. of Plant Biology. [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-81ER10873. Order Number DE95008638. Source: OSTI; NTIS; GPO Dep.

This is a progress report/renewal request for work of the roles played by mitochondrial DNA and nuclear genes in reversion to fertility in s-type male sterile maize. Information is included for the following major catagories of research on this project: molecular basis for nuclear reversion; molecular characterization of cytoplasmic revertants; nuclear control over cytoplasmic reversion and over replication of S1 and S2; developmental studies; transposition of nuclear restorer elements.

16606 (UCRL-JC–117560) **Three dimensional imaging of DNA fragments during electrophoresis using a confocal detector.** Brewer, L.R.; Davidson, C.; Balch, J.; Carrano, A. Lawrence Livermore National Lab., CA (United States). 30 Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–32: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95009463. Source: OSTI; NTIS; GPO Dep.

We have measured the three dimensional distribution of DNA fragments within an electrophoretic band. The measurements were made using a confocal microscope and a photon counting photomultiplier detector. A DNA sequencing standard was loaded into glass microchannel plates containing polyacrylamide gel. The measurements were made by scanning the plates in three dimensions using a mechanical stage under computer control, while electrophoresis was taking place. We found that the distribution of DNA was the same for all the bands measured in the sequencing ladder with an approximate Gaussian distribution along all three axes. These measurements are important to understand what physical forces shape electrophoretic bands confined by a channel and also to aid in the design of high throughput DNA sequencers.

Increased patient throughput and lengthened P.E.T. scan protocols have increased the radiation dose received by P.E.T. technologists. Automated methods of tracer infusion and blood sampling have been introduced to reduce direct contact with the radioisotopes, but significant radiation exposure still exists during the receipt and dispensing of the patient dose. To address this situation the authors have developed an automated robotic system which performs these tasks, thus limiting the physical contact between operator and radioisotope.

16608 (DOE/ER/60460–T4) **Harvard-MIT research program in short-lived radiopharmaceuticals. Final report.** Adelstein, S.J. (Massachusetts Inst. of Tech., Cambridge, MA (United States). Office of Sponsored Programs). Massachusetts Inst. of Tech., Cambridge, MA (United States). Feb 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER60460 ; FG02-87ER60526. Order Number DE95009691. Source: OSTI; NTIS; INIS; GPO Dep.

The Harvard-MIT Research Program in Short-lived Radiopharmaceuticals was established in 1977 to foster interaction among groups working in radiopharmaceutical chemistry at Harvard Medical School, the Massachusetts Institute of Technology, and the Massachusetts General Hospital. To this was added a group at The Childrens Hospital. From these collaborations and building upon the special strengths of the participating individuals, laboratories and institutions, it was hoped that original approaches would be found for the design of new, clinically useful, radiolabeled compounds. The original thrust of this proposal included: (a) examination of the coordination chemistry of technetium as a basis for rational radiopharmaceutical design, (b) development of an ultrashort-lived radionuclide generator for the diagnosis of congenital heart disease in newborns, (c) synthesis of receptor-site-directed halopharmaceuticals, (d) improved facile labeling of complex molecules with positron-emitting radionuclides. The authors' 1986 proposal was oriented toward organs and disease, emphasizing radiolabeled agents that delineate specific functions and the distribution of receptors in brain, heart, and tumors. In 1989, they further refined their purposes and focused on two major aims: (a) synthesis and utilization of neutral technetium and rhenium complexes of high specific activity, and (b) development of new approaches to the radiolabeling of proteins, peptides, immunoglobulins, and their fragments. In 1992, the authors amended this proposal to concentrate their efforts on biologically active peptides and proteins for targeted radiodiagnosis and therapy.

This document contains the abstracts from the American College of Nuclear Physicians 1993 Fall Meeting entitled, 'Frontiers in Nuclear Medicine Symposium: Nuclear Medicine and Molecular Biology'. This meeting was sponsored by the US DOE, Office of Health and Environmental Research, Office of Energy Research. The program chairman was Richard C. Reba, M.D.

16610 (INIS-BR–3481) **Study of air cavities influence in head and neck radiotherapy with 10 MV photon beam.** Souza, C.N. de. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Mar 1989. 73p. (In Portuguese). Order Number DE95626721. Source: OSTI; NTIS (US Sales Only); INIS.

PRONUCLEAR. Tese de Mestrado, 47.

This is a study about dose distribution in the larynx region under irradiation with a 10 MV photon beam. This localization presents air cavities, that can compromise the dose at air-tissue interfaces by electronic equilibrium loss and backscattering lack. For this study, a parallel ionization chamber was used in the air cavities simulated with a perspex phantom. The influence of the air cavities in the proximal, distal and lateral interfaces was analysed. The results showed a expressive loss of dose at the air-tissue interface. For typical irradiation field and anatomic cavity, under dose values of 4% in the proximal interface, 11% in the distal interface and 7% in the lateral interface were found. Irradiation field larger than 6 X 6 cm^2 were optimal in reducing the total effect of under dosing at the interface. (author). 39 refs, 23 figs, 12 tabs.

16612 (SAND–95-0672C) **The use of low energy, ion induced nuclear reactions for proton radiotherapy applications.** Horn, K.M. (Sandia National Labs., Albuquerque, NM (United States)); Doyle, B.; Segal, M.N.; Hamm, R.W.; Adler, R.J.; Glatstein, E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950220–5: 9. international conference on ion beam modification of materials, Canberra (Australia), 5-10 Feb 1995). Order Number DE95009859. Source: OSTI; NTIS; INIS; GPO Dep.

Medical radiotherapy has traditionally relied upon the use of external photon beams and internally implanted radioisotopes as the chief means of irradiating tumors. However, advances in accelerator technology and the exploitation of novel means of producing radiation may provide useful alternatives to some current modes of medical radiation delivery with reduced total dose to surrounding healthy tissue, reduced expense, or increased treatment accessibility. This paper will briefly overview currently established modes of radiation therapy, techniques still considered experimental but in clinical use, innovative concepts under study that may enable new forms of treatment or enhance existing ones. The potential role of low energy, ion-induced nuclear reactions in radiotherapy applications is examined specifically for the 650 keV d(^{3}He,p)^{4}He nuclear reaction. This examination will describe the basic physics associated with this reaction's production of 17.4 MeV protons and the processes used to fabricate the necessary materials used in the technique. Calculations of the delivered radiation dose, heat generation, and required exposure times are presented. Experimental data are also presented validating the dose calculations. The design of small, lower cost ion accelerators, as embodied in 'nested'-tandem and radio frequency quadrupole accelerators is examined, as is the potential use of high-output ^{3}He and deuterium ion sources. Finally, potential clinical applications are discussed in terms of the advantages and disadvantages of this technique with respect to current radiotherapy methods and equipment.

16613 (UCRL-JC–118754) **Electron transport in radiotherapy using local-to-global Monte Carlo.** Svatos, M.M. (Lawrence Livermore National Lab., CA (United States)); Chandler, W.P.; Siantar, C.L.H.; Rathkopf, J.A.; Ballinger, C.T.; Neuenschwander, H.; Mackie, T.R.; Reckwerdt, P.J. Lawrence Livermore National Lab., CA (United States). Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States);National Insts. of Health, Bethesda, MD (United States). DOE Contract W-7405-ENG-48. NIH Grant CA52692. (CONF-950420–22: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95009563. Source: OSTI; NTIS; INIS; GPO Dep.

Local-to-Global (L-G) Monte Carlo methods are a way to make three-dimensional electron transport both fast and accurate relative to other Monte Carlo methods. This is achieved by breaking the simulation into two stages: a local calculation done over small geometries having the size and shape of the "steps" to be taken through the mesh; and a global calculation which relies on a stepping code that samples the stored results of the local calculation. The increase in speed results from taking fewer steps in the global calculation than required by ordinary Monte Carlo codes and by speeding up the calculation per step. The potential for accuracy comes from the ability to use long runs of detailed codes to compile probability distribution functions (PDFs) in the local calculation. Specific examples of successful Local-to-Global algorithms are given.

16614 (ENEA-RT-INN–94-44) **In vivo pollination with maize pollen stored in aqueous medium.** Broglia, M. (ENEA, Casaccia (Italy). Area Energia e Innovazione). ENEA, Casaccia (Italy). Area Energia e Innovazione. Nov 1994. 13p. (RT/INN–94-44). Order Number DE95771023. Source: OSTI; NTIS (US Sales Only).

A hypertonic aqueous medium can be used to obtain non-bursting, non-germinating maize (zea mays L.) pollen suspensions, which can be stored at 0_0C preserving pollen viability. This medium could be used in different techniques for maize pollen genetic manipulation, but fertilization ability of such stored pollen has to be proved. In this work, pollen stored in different hypertonic media was used to perform in vivo pollinations by different techniques. Uncut silks and pollen filtered in a paste form were found necessary perequisites for a fruitfull pollen-silk interaction. In the 0.5-1.5 M range a highter sucrose concentration increases storability but decreases fertilization ability. Salts as KNO_3 and $CaCl_2$ were also explored in an osmotic concentration range. Considering that soluble calcium, needful for germination, can be lost from pollen in aqueous media, a hypertonic aqueous medium osmotically balanced in calcium and sucrose contents was tested as storage medium. Pollen stored several hours in this medium produced numerous seed sets; the high variability of the obtained results made evident the crucial role of silk status in successful pollinations.

16616 (INIS-BR–3486) **Production of double antibody for radioimmunoassay (sheep anti-rabbit IgG antiserum).** Silva, S.R. da. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1993. 177p. (In Portuguese). Order Number DE95626630. Source: OSTI; NTIS (US Sales Only); INIS.

A second antibody (sheep anti-rabbit IgG antiserum) to be used in RIAs in which the first antibody is raised in rabbits was produced. For this production, initially the IgG was isolated from rabbit serum and purified by sodium sulphate precipitation followed by ion exchange chromatography on DEAE-cellulose. Four sheep were immunized with 500 u g of purified rabbit IgG, emulsified in Freund Complete Adjuvant and administered by multisite subcutaneous injections. These injections were repeated at 20-days intervals and blood samples (40 ml) were taken from the jugular vein 10 days after the boosts for the evaluation of the antisera title. After each four boosts a great bleeding was done by the same route. Approximately 500 ml of serum were obtained in each bleeding per animal. The antisera were evaluated by the human thyrotropin RIA developed at IPEN laboratories employing reagents provided by NIDDKD, USA. These evaluations referred to the determination of the antisera title and of the ideal concentration of carrier IgG, to the study of the kinetic of precipitation and to the confirmation of the inexistent cross-reactivity with human IgG, in comparison with a reference antiserum of know precipitation characteristics supplied by the Radioassay System Laboratories. Approximately 3,6 l of antiserum (sheep anti-rabbit IgG serum) were produced from the four sheep, which presented title and precipitation characteristics very similar to those exhibited by the imported commercial product, even presenting higher titles. The results obtained in this work indicated that it was created enough experience for the production of this biological reagent for RIA, that could be done integrally in the country in greater scale, and at a very reduced cost. (author). 81 refs, 36 figs, 33 tabs.

This document presents project summaries that demonstrate specific capabilities of interest to the forest, wood and paper industry in areas where PNL offers significant depth of experience or unique expertise. Though PNL possesses a wide range of capabilities across many of the technology-related issues identified by the industry, this document focuses on capabilities that meet the specific forest, wood and paper industry needs of the following research areas: forest inventory; human and environmental effects; energy and environmental tradeoffs; reduction of impacts of liquid effluent; solid wastes; removal of non-process elements in pulp and paper operations; life cycle assessment; and process measurement and controls. In addition, PNL can provide the forest, wood and paper industry with support in areas such as strategic and program planning, stakeholder communications and outreach, budget defense and quality metrics. These are services PNL provides directly to several programs within DOE.

Health Physics Div.); Jaiswal, D.D.; Parameswaran, M.; Krishnamony, S. Bhabha Atomic Research Centre, Bombay (India). 1994. 74p. Order Number DE95627827. Source: OSTI; NTIS (US Sales Only); INIS.

The collation and generation of data on physical, anatomical, physiological and metabolic characteristics of Indian subjects were carried out to set up a Reference Indian Man for radiation protection. A comparison of the Reference Indian Man data with the corresponding data for ICRP Reference Man, clearly showed that the physical, anatomical and metabolic characteristics were in general smaller for Reference Indian Man. A few of the physiological characteristics such as the daily consumption of drinking water, sweat rate were however, found to be higher, and the minute volume was similar for Reference Indian, in comparison to the ICRP Reference Man. The details of various human characteristics representative of the Indian population are reported in this paper. (author). 43 refs., 25 tabs., 6 figs.

16621 (CONF-9304128–, pp. C.5) **Radiological worker II training implementing practical exercise training.** Seilhymer, P. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Hanford Company (WHC) developed and implemented Practical Exercise Training as part of the Radiological Worker II Training Program. This program meets the requirements of the DOE Radiological Control Manual (DOE N5480.6) as stated in chapter 6. WHC developed the practical exercise based on input from several sources, including both DOE sites and public utilities as directed form INPO. Each student receives one-on-one evaluation by a qualified instructor/evaluator. An objective point-based

grading system requires that each student successfully complete the practical exercise with an 80% passing score. Emphasis during the exercise focuses on control of radiation exposure and contamination spread. The implementation of this practical exercise program does not require expending large amounts of money.

16622 (CONF-9304128–, pp. C.6) **Radiological control technician implementing continuing training.** Killand, B. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Hanford Company (WHC) has developed and is implementing a continuing training program for RCTs. This program was designed to meet the requirements of the DOE and Hanford Site Radiological Control Manual. The program is scheduled on a biennial (two year), six cycle format, where each cycle is seventeen weeks in length. This enables the technician to be in the classroom three times per year, for an average of four days each cycle. Content emphasis is placed on: academics review; lessons learned; new equipment and procedures; practical skills training; and oral board preparation. Academic reviews provide refresher training on core and site academics in both lecture and overview formats. During the first five cycles, an average of six lessons are presented. A preparatory exam is administered along with a quiz covering previous cycles. The sixth cycle is dedicated to an academic review of all previous lesson content, the final comprehensive exam, and the oral examination boards. In conjunction with continuing training, technicians receive additional company required training, providing a substantial cost savings to WHC. WHC employs approximately 300 RCTs.

16623 (CONF-9304128–, pp. C.19) **Post-training evaluation program for radiological worker training.** Sanders, M.D. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Savannah River Company (WSRC) has developed an innovative method to implement a post-training evaluation program for Radiological Worker Training. The DOE Radiological Control Manual requires that a method be established to verify the effectiveness of Radiological Control Training, which makes this innovative method more crucial. Savannah River Site's method utilizes videotaped scenarios which illustrates a variety of topics and situations covered in RWT. The use of realistic scenarios on videotapes places the usual mundane topics into a more interesting perspective for the radiological workers (4% of the population which is about 400 workers at SRS) and then administers a multiple-choice questionnaire, consisting of 20 objective-based questions. The results are used to determine which areas of the current RWT program need reinforcement. This is a continuous evaluation program and therefore, is repeated about every six months with new video material and questionnaires developed as needed. SRS is currently in the third cycle of the Post-Training Evaluation Program. The first Post-Training Evaluation was implemented from October 1991 - March 1992.

16624 (CONF-9304128–, pp. D.2) **Development of an external dosimetry technical basis manual.** Dyer, S.G. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Savannah River Company (WSRC) identified the need to develop a Technical Basis Manual for the site's external dosimetry program. This manual consolidates in a stand-alone document the various programmatic methods and supporting technical data on which the external dosimetry program is based. Recently published, the External Dosimetry Technical Basis Manual has become a ready reference for responding to inquiries about the program and will be used during DOELAP onsite assessments. The manual has also provided an excellent reference document for field health physicists as well as a mechanism for documenting new and innovative dosimetry techniques implemented at the Savannah River Site.

16625 (CONF-9304128–, pp. D.10) **A method, using ICRP 26 weighting factors, to determine effective dose equivalent due to nonuniform external exposures.** Dyer, S.G. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Savannah River Company (WSRC) has recently implemented a methodology and supporting procedures to calculate effective dose equivalent for external exposures. The calculations are based on ICRP 26 methodology and are used to evaluate exposures when multibadging is used. The methodology is based upon the concept of "whole body" compartmentalization (i.e., the whole body is separated into seven specific regions of radiological concern and weighted accordingly). The highest dose measured in each compartment is used to determine the weighted dose to that compartment. Benefits of determining effective dose equivalent are compliance with DOE Orders, more accurate dose assessments, and the opportunity for improved worker protection through new ALARA opportunities.

16626 (CONF-9304128–, pp. D.11) **Article 511 or a section 8 - which makes more sense?.** Murphy, G. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy Radiological Control Manual (RCM) addresses the requirements for issuing personnel dosimetry in Part 1, External Dosimetry, Section 511, Requirements. As in other areas of the RCM, there is an attempt to establish specific requirements for issuance of personnel dosimetry, but there is also considerable leeway based on some select phrases. Martin Marietta Energy Systems convened a working group of external dosimetry professionals to review several scenarios for issuance criteria and then adopted a final criteria after each scenario was evaluated against a standardized set of risk elements. Finally, recommended changes to Article 511 will be presented.

16627 (CONF-9304128–, pp. E.10) **The DOE in-vivo phantom library program.** Olsen, P.C. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The use of improved in vivo bioassay calibration phantoms in recent years has led to significant advances in the detection capabilities of in vivo counting laboratories, and increased ability to cross-calibrate various systems and laboratories for standardization purposes in DOE programs. The cost of these phantoms are significant, though, and this inhibits successful intercomparisons for improving calibrations. A recent CIRRPC Workshop on Internal Dosimetry in April 1992 recommended establishing intercomparison programs for in vivo measurements and improved phantom designs. Improved phantoms, developed at PNL with NIST-traceable source reference material loadings, proven solid tissue substitutes,

and extensive documentation on construction, activity, and physical and chemical composition are available through a newly operational library. These phantoms use original LLNL molds and existing BOMAB phantom shells, but with improved tissue substitutes. All phantom materials have been extensively tested for their chemical, physical, and radiation transmission properties, and are tailored for identical transmission characteristics at the photon energies of concern. PNL has been pursuing approval from NIST for "certification" of these phantoms. The DOE Phantom Library loans organ, whole-body, and through cooperation with USTR, an Am-241 skeletal phantom to DOE contractor laboratories without cost. Only the price of shipping the phantom is requested. This paper will discuss the operation of the library, the current and planned holdings, the quality of phantom construction, and planning for NIST cooperation in certifying these phantoms.

16628 (CONF-9304128–, pp. E.27) **A DOE/NRC dosimetry intercomparison study.** Loesch, R.M. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

A project to evaluate the consistency of internal dosimetry assessments has been jointly undertaken by the Department of Energy (DOE) and the Nuclear Regulatory Commission (NRC) through the Pacific Northwest Laboratory. The focus of this pilot study is to identify problem areas that need to be resolved before establishing an accreditation program in internal dosimetry. A total of eleven laboratories, including DOE sites and NRC licensees, participated in this intercomparison study. A questionnaire consisting of five actual exposure scenarios, previously used in a European Study, was sent to participants for evaluation. The participating dosimetrists assessed the data of the test scenarios and provided results in terms of estimated radionuclide intake and the resulting internal doses. Except for one test case, results show that the standard deviation of the calculated doses for each scenario is within 30% to 50% of the mean value, giving a consistency comparable to that of the European study. The discrepancies can be attributed to variations in (1) the interpretation and statistical treatment of the bioassay data, (2) the biokinetic models used, and (3) the computational tools used. The results of this intercomparison study will provide information for improvements in future test protocols, which may eventually lead to an accreditation program.

16629 (CONF-9304128–, pp. H.2) **Formation of an environmental restoration user group for radiological controls.** Morris, R.L. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

An Environmental Restoration User Group for Radiological Controls will be proposed. Article 116 of the Radiological Control Manual encourages contractors to establish informal working associations that promote dialogue among similar facilities. Chem-Nuclear Geotech, Inc., is willing to initially organize and lead a users group to work on common problems, define standard methods, publish a Radiological Work Practices Handbook, and recommend regulatory changes to make environmental restoration programs more cost effective without compromising radiological control. A charter for the users group will be proposed. A questionnaire will be distributed to interested persons to assist in development of focus groups and agenda items for the first meeting. The first meeting is planned for May 25-26, 1993, in Grand Junction Colorado. All interested persons are welcome to attend.

16630 (CONF-9304128–, pp. K.2) **Current and future health physics research at Lawrence Livermore National Laboratory.** Hickman, D.P. (Lawrence Livermore National Lab., CA (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory has developed several radiation protection instruments and continues to pursue new approaches in this area. Some of the instruments developed include innovative air-monitoring systems; neutron detection and dosimetry systems; specialized calibration materials and structures, such as the LLNL Realistic Torso Phantom; a fast-response detector system to detect stray beams from x-ray fluorescence devices that can be manufactured for less than $600; and a reliable, light weight personnel air-monitoring system that can be incorporated into a security badge/dosimeter package. A multi-disciplinary team of experts at LLNL is developing and testing cleanable/reusable high-efficiency particulate air-filtration systems and highly sensitive instrumentation for differentiating transuranic waste from non-transuranic waste; developing an advanced detector and circuit design for a hand-held neutron spectrometer; developing techniques for detecting neutron sources using CR-39 and for calibrating in-vivo measurement equipment using Magnetic Resonance Imaging and Monte Carlo simulation; and developing a seamless bottle mannequin adsorption (BOMAB) phantom with recessed fill caps, which have no potential for leakage of liquid sources used for calibrating whole-body counters.

16631 (CONF-9304128–, pp. A.2-A.55) **DOE radiological control manual implementation strategy at the Savannah River Site.** Cabbil, C. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Savannah River Site (SRS) is to "Serve the national security interest of the United States by safely producing nuclear materials while protecting the employee and public health, as well as the environment." There are 35 facilities at SRS associated with nuclear materials processing and support activities. Facility missions include Plutonium processing and storage, Tritium processing, and handling and storage of high level radioactive waste. The pursuit of excellence in the area of Radiation Protection has been a major area of emphasis for the site for the past 3 years, beginning with the aggressive effort to fully implement DOE Order 5480.11. With the issuance of DOE N 5480.6 in June 1992, effective date 12/1/92, a new phase for radiation protection program improvement was initiated. Based on the experience and lessons learned by the site during implementation of DOE Order 5480.11, the site developed a detailed implementation strategy to accomplish the guidelines set forth in the DOE Radiological Controls Manual.

16632 (CONF-9304128–, pp. A.56-A.57) **Implementation of the new DOE Radiological Control Manual.** Bush, T.S. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

In 1985, WINCO implemented their original Radiological Control Manual (RCM). In 1990 this manual was used as a basis for company wide RCM. Then in 1992 the Westinghouse RCM was utilized by DOE in the development of the DOE RCM. In December 1992 an individual was assigned as the Implementation coordinator. The implementation was divided into articles, and sometimes paragraphs and sentences. The implementation coordinator sent letters to each responsible individual to instruct them on the actions necessary to implement the article and the completion due date. The coordinator then made contact monthly to ensure the actions were being carried out. Because the assignment of responsible individuals came from their department managers, they were anxious to do whatever was necessary to close out the articles.

16633 (CONF-9304128–, pp. A.58-A.63) **Hanford Site Radiological Control Manual.** Munson, L.H. (Pacific Northwest Lab., Richland, WA (United States)); Vargo, G.J.; Selby, J.M.; Clark, D.L. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

In June 1992, the U.S. Department of Energy (DOE) issued DOE N5480.6, Radiological Control, which set forth DOE's Radiological Control Program and established the framework for its implementation at sites nationwide. Accompanying the Order was the DOE Radiological Control Manual (DOE RCM), which provided the detailed requirements for the program. The Order also mandated Field Office issuance of site-specific radiological control manuals by December 1, 1992. This paper presents the approach taken to develop, review, approve, implement, and subsequently maintain the site-specific manual for the DOE Richland Field Office (RL) at Hanford Site.

16634 (CONF-9304128–, pp. A.64-A.81) **Radiological control implementation guide.** Hamley, S.A. (Oak Ridge National Lab., TN (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

A manual is being developed to explain to line managers how radiological controls are designed and implemented. The manual also fills a gap in the Health Physics literature between textbooks and on-the-floor procedures. It may be helpful to new Health Physicists with little practical experience and to those wishing to improve self-assessment, audit, and appraisal processes. Many audits, appraisals, and evaluations have indicated a need for cultural change, increased vigor and example, and more effective oversight by line management. Inadequate work controls are a frequent and recurring problem identified in occurrence reports and accident investigations. Closer study frequently indicates that many line managers are willing to change and want to achieve excellence, but no effective guidance exists that will enable them to understand and implement a modern radiological control program.

16635 (CONF-9304128–, pp. A.82-A.84) **Radiological evaluation program by the Office of Nuclear Safety.** Blackwood, E.; Adamovitz, S. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE Radiological Evaluation Program, managed and coordinated by the Office of Nuclear Safety, began in 1992. On January 16, 1992, the Secretary of Energy issued a memorandum which assigned responsibility Department-wide for radiological oversight to the Office of Nuclear Safety. On March 13, 1992, the Secretary issued a memorandum which required that radiological evaluations be initiated by the end of calendar year 1992, and the Radiological Oversight Division was formed within the Office of Nuclear Safety in April 1992.

16636 (CONF-9304128–, pp. B.11-B.13) **The Martin Marietta Energy Systems Associated Laboratories for Excellence in Radiation Technology (ALERT).** Bogard, J.S. (Oak Ridge National Lab., TN (United States)); Casson, W.H. Sr.; Bauer, M.L.; Gregory, D.C. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The excellence and uniqueness of radiation technology expertise at Oak Ridge National Laboratory (ORNL) was recognized during a review by the DOE Oak Ridge Field Office prior to a 1990 Tiger Team review, and the Laboratory was encouraged at that time to explore ways of sharing this expertise with other DOE facilities. The subsequent evolution of DOE Laboratory Accreditation Programs, with their challenging performance requirements, and of program guidance such as that contained in the DOE Radiation Control Manual, which requires improved radiological instrument services and encourages standardization, reemphasizes the importance of sharing ORNL's extensive capabilities for supporting improved radiological safety and health programs.

16637 (CONF-9304128–, pp. B.14-B.18) **Beta/gamma test problems for ITS.** Mei, G.T. (Oak Ridge National Lab., TN (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The Integrated Tiger Series of Coupled Electron/Photon Monte Carlo Transport Codes (ITS 3.0, PC Version) was used at Oak Ridge National Laboratory (ORNL) to compare with and extend the experimental findings of the beta/gamma response of selected health physics instruments. In order to assure that ITS gives correct results, several beta/gamma problems have been tested. ITS was used to simulate these problems numerically, and results for each were compared to the problem's experimental or analytical results. ITS successfully predicted the experimental or analytical results of all tested problems within the statistical uncertainty inherent in the Monte Carlo method.

16638 (CONF-9304128–, pp. B.19-B.25) **Trust versus confidence: Microprocessors and personnel monitoring.** Chiaro, P.J. Jr. (Oak Ridge National Lab., TN (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC05-84OR21400. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Due to recent technological advances, substantial improvements have been made in personnel contamination monitoring. In all likelihood, these advances will close out the days of manually frisking personnel for radioactive contamination. Unfortunately, as microprocessor-based monitors become more widely used, not only at commercial power reactors but also at government facilities, questions concerning their trustworthiness arise. Algorithms make decisions that were previously made by technicians. Trust is placed not in technicians but in machines. In doing this it is assumed that the machine never misses. Inevitably, this trust drops, due largely to "false alarms." This is especially true when monitoring for alpha contamination. What is a "false alarm?" Do these machines and their algorithms that we put our trust in make mistakes? An analysis was performed on half-body and hand-and-foot monitors at Oak Ridge National Laboratory (ORNL) in order to justify the suggested confidence level used for alarm point determination. Sources used in this analysis had activities approximating ORNL's contamination limits.

16639 (CONF-9304128–, pp. B.2-B.10) **New approaches to instrumentation and calibration.** Bishop, R.V. (Oak Ridge National Lab., TN (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

DOE facilities are required to offer for sale to the public items of salvageable value when they are no longer required by the facilities. These items have to be surveyed to ensure radioactive

contamination levels do not exceed the values listed in DOE Order 5400.5. Most facilities use portable contamination monitoring equipment with probe areas between 20 and 100 cm^2 to check for fixed contamination. This procedure is very labor intensive and results in survey costs that often exceed the costs recovered from selling the items. A solution would be to use large are (> 100 cm^2) detectors to find and quantify contamination. Large area scintillation detectors that can be used for beta and alpha detection simultaneously are becoming available commercially. Combining these with a rate meter than can differentiate between alpha and beta events can result in a survey that takes considerably less time to do and will save a proportional amount of money in doing so. The use and limitations of this combination of detectors and rate meters will be discussed.

16640 (CONF-9304128–, pp. B.35-B.43) **ISO standards on the evaluation of contamination.** Swinth, K.L. (Pacific Northwest Lab., Richland, WA (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The International Organization for Standardization (ISO) develops radiation calibration standards through Subcommittee 2 (titled "Radiation Protection") of Technical Committee 85 (ISO/TC85/SC2). The subcommittee has also developed standards providing guidance on the performance of measurements. ISO/TC85/SC2 consists of international technical experts who represent their countries through the international consensus process in providing guidance in several radiation protection areas. The purpose of this paper is to summarize ISO's guidance provided in the area of contamination measurements.

16641 (CONF-9304128–, pp. C.10-C.18) **DOE Radiological Control Manual Core Training Program.** Scott, H.L.; Maisler, J. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Over the past year, the Department of Energy (DOE) Office of Health (EH-40) has taken a leading role in the development of new standardized radiological control training programs for use throughout the DOE complex. The Department promulgated its Radiological Control (RadCon) Manual in June 1992. To ensure consistent application of the criteria presented in the RadCon Manual, standardized radiological control core training courses and training materials have been developed for implementation at all DOE facilities. In producing local training programs, standardized core courses are to be supplemented with site-specific lesson plans, viewgraphs, student handbooks, qualification standards, question banks, and wallet-sized training certificates. Training programs for General Employee Radiological Training, Radiological Worker I and II Training, and Radiological Control Technician Training have been disseminated. Also, training committees under the direction of the Office of Health (EH-40) have been established for the development of additional core training courses, development of examination banks, and the update of the existing core training courses. This paper discusses the current activities and future direction of the DOE radiological control core training program.

16642 (CONF-9304128–, pp. C.2-C.4) **Development and implementation of a radiological worker training program for an architect/engineer contractor.** Niemuth, W. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Prior to the implementation of the DOE Rad Con Manual, Kaiser Engineers Hanford offered a four hour radiation worker class, which met all DOE 5480.11 requirements. This class included a dress/undress exercise. The content of the class was focused on the construction worker who is our typical radiation worker. We did not go into depth on the theory material, having a general feeling that this would not be essential information to the typical construction worker. We tried to gear the class to the level of understanding of the average craft worker. We provide training to 500 employees in the average year.

16643 (CONF-9304128–, pp. C.7-C.9) **A defense programs training initiative in the area of radiological control.** Larsen, D. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

In a memorandum of January 16, 1992, former Secretary of Energy Watkins directed that line management take immediate action to ensure that personnel assigned to monitor the onsite performance of the contractor radiation protection activities receive proper training. Consequently, the Office of Defense Programs has developed two courses: a two-week conduct of radiological operations course to provide an introductory course of basic health physics theory and recommend applied health physics practices for evaluation of radiological operations at DOE sites; and, a two-day conduct of radiological operations course to give an overview of the Radiological Control Manual and of applied health physics at the various types of DOE facilities.

16644 (CONF-9304128–, pp. D.3-D.9) **Personnel dose assignment practices.** Fix, J.J. (Pacific Northwest Lab., Richland, WA (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Implementation of DOE N 5480.6 Radiological Control Manual Article 511(3) requirements, to minimize the assignment of personnel dosimeters, should be done only under a broader context ensuring that capabilities are in place to monitor and record personnel exposure both for compliance and for potential litigation. As noted in NCRP Report No. 114, personnel dosimetry programs are conducted to meet four major objectives: radiation safety program control and evaluation; regulatory compliance; epidemiological research; and litigation. A change to Article 511(3) is proposed that would require that minimizing the assignment of personnel dosimeters take place only following full evaluation of overall capabilities (e.g., access control, area dosimetry, etc.) to meet the NCRP objectives.

16645 (CONF-9304128–, pp. E.11-E.14) **Evaluation of an intake of plutonium 238: A case history.** La Bone, T.R.; Kim, E.M. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

In July 1991 a plutonium worker at the Savannah River Site (SRS) was exposed to airborne plutonium-238 from a contaminated shipping container. She was chelated with Zn-DTPA shortly after the incident and placed on a special bioassay program. Based on early urinary and fecal excretion, an initial dose estimate of 1525 mrem committed effective dose equivalent (CEDE) was reported 20 days later. As additional bioassay data were collected the dose was revised to 1840 mrem CEDE on day 88 and to 3660 mrem CEDE on day 245. This last estimate was officially reported to the Department of Energy (DOE). The urinary excretion data and expectation curve for the model are shown. Only the data to

the left of the first vertical line (3/92 Evaluation) were available at the time of the initial dose estimate.

16646 (CONF-9304128–, pp. E.15-E.26) **Plutonium bioassay by inductively coupled plasma mass spectrometry (ICP/MS).** Wyse, E.J. (Pacific Northwest Lab., Richland, WA (United States)); Fisher, D.R. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The determination of plutonium in urine poses several analytical challenges, e.g., detectability, matrix, etc. We have investigated the feasibility of analyzing plutonium in processed urine by inductively coupled plasma mass spectrometry (ICP/MS). The urine samples are first spiked with ^{244}Pu as a tracer and internal standard, then processed by co-precipitation and column chromatography using TRU-Spec™, an extraction resin. By enhancing ICP/MS detection capabilities via improved sample introduction via improved sample introduction and data acquisition efficiencies, an instrumental detection limit of 5 to 50 fg (0.3 to 3 fCi for ^{239}Pu) is typically obtained, depending on the desired degree of quantitation. A brief summary of the analytical method as well as the basis for measuring radionuclides by ICP/MS are submitted; the separation procedure, methods of sample introduction, and data acquisition techniques are then highlighted.

16647 (CONF-9304128–, pp. E.2-E.7) **Internal dosimetry and lifetime dose control-impacts of the U.S. Department of Energy Radiological Control Manual.** Baumann, B.L.; Aldridge, T.L. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

This paper outlines Westinghouse Hanford Company (WHC) implementation of lifetime worker dose controls, required in the US Department of Energy (DOE) Radiological Control Manual (RCM) (DOE 1992). In addition, this paper discusses the impacts of tracking doses from intakes of long-term bone seeking radionuclides. Prior to the RCM, an internal WHC policy implemented lifetime dose controls based on total internal and external dose. This lifetime dose control level has affected the careers of approximately 17 workers at the Hanford Site. Additional impacts are anticipated because changes in tracking internal doses increase the significance of tracking plutonium intakes.

16648 (CONF-9304128–, pp. E.8-E.9) **Categorization of worker bioassay programs based on intake potential.** Thomas, S.A.; McFee, M.C.; La Bone, T.R. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The routine bioassay program at the Savannah River Site (SRS) has undergone considerable change in the last ten years. The causes of this change may be traced to changes in personnel and regulations during this time. Prior to the 1980's, the workforce was relatively small, stable, and experienced. Bioassay programs were administered in the field by Health Protection personnel who were very familiar with all the personnel in their facility and the potential problems that could occur in those facilities. The radiation protection regulations had not changed drastically in 20 years, and they were based on readily understood quantities such as the quantity of radioactive material in the body.

16649 (CONF-9304128–, pp. F.11-F.13) **PC edit package for testing of annual radiation dose summary data.** Millet, W.H. (Idaho National Engineering Lab., Idaho Falls, ID (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC07-76ID01570. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this presentation is to introduce a software package for the testing of annual radiation dose summary data by the DOE contractor site prior to submitting the report to DOE's Radiation Records Repository. This software will identify most errors existing in the annual radiation dose summary data before the data leaves the originating site. This process will greatly reduce the reviewing and editing tasks of staff members at the repository.

16650 (CONF-9304128–, pp. F.14-F.24) **Dose variables to serve radiation protection and epidemiologic needs.** Fix, J.J. (Pacific Northwest Lab., Richland, WA (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) implemented the Comprehensive Epidemiologic Data Resource (CEDR) to facilitate independent research to validate and supplement DOE research on human health effects. A dosimetry working group was formed during 1991 to evaluate radiation dose variables and associated documentation that would be most useful to researchers for retrospective and prospective studies. The working group included dosimetrists and epidemiologists from several DOE laboratories. An overview of the recommendations included in the final report from the working group is presented. Basically, relatively minor additions to routine dose assessment and record keeping practices are needed to provide important parameters necessary for prospective epidemiologic evaluations. Without these additions, serious inconsistencies between past and current recorded dose will occur, and the data will be more limited for epidemiologic purposes.

16651 (CONF-9304128–, pp. F.2-F.10) **Development and implementation of a new radiation exposure record system.** Lyon, M. (Pacific Northwest Lab., Richland, WA (United States)); Berndt, V.L.; Trevino, G.W.; Oakley, B.M. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Radiological Records Program (HRRP) maintains all available radiation exposure records created since the 1940s for employees of and visitors to the Hanford Site. The program provides exposure status reports to the US Department of Energy Richland Operations Office (DOE-RL) and the Hanford contractors, annual exposure reports to individual employees and visitors, and exposure reports to terminated employees. Program staff respond to offsite requests for exposure data on former employees and supply data and reports for epidemiological and research projects as well as for annual reports required by DOE Orders. Historical files, documenting radiation protection and dosimetry policies, procedures, and practices, and radiological incidents, are also maintained under this program. The program is operated by Pacific Northwest Laboratory for DOE-RL. This paper describes how the record-keeping requirements supported by the HRRP's computerized radiation exposure database were analyzed so that the system could be redeveloped and implemented to (1) accommodate a change in mainframe computer units, and (2) to enhance its automated record-keeping, retrieval, and reporting capabilities in support of the HRRP.

16652 (CONF-9304128–, pp. G.14-G.26) **A case study on determining air monitoring requirements in a radioactive materials handling area.** Newton, G.J. USDOE Assistant Secretary for

Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC04-76EV01013. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

A technical, defensible basis for the number and placement of air sampling instruments in a radioactive materials handling facility was developed. Historical air sampling data, process and physicochemical knowledge, qualitative smoke dispersion studies with video documentation, and quantitative trace gas dispersion studies were used to develop a strategy for number and placement of air samplers. These approaches can be used in other facilities to provide a basis for operational decisions. The requirements for retrospective sampling, personal sampling, and real-time monitoring are included. Other relevant operational decisions include selecting the numbers, placement, and appropriate sampling rates for instruments, identifying areas of stagnation or recirculation, and determining the adequacy and efficiency of any sampling transport lines. Justification is presented for using a graded approach to characterizing the workplace and determining air sampling and monitoring needs.

16653 (CONF-9304128–, pp. G.2-G.7) **Technical basis and evaluation criteria for an air sampling/monitoring program.** Gregory, D.C. (Oak Ridge National Lab., TN (United States)); Bryan, W.L.; Falter, K.G. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC05-84OR21400. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Air sampling and monitoring programs at DOE facilities need to be reviewed in light of revised requirements and guidance found in, for example, DOE Notice 5480.6 (RadCon Manual). Accordingly, the Oak Ridge National Laboratory (ORNL) air monitoring program is being revised and placed on a sound technical basis. A draft technical basis document has been written to establish placement criteria for instruments and to guide the "retrospective sampling or real-time monitoring" decision. Facility evaluations are being used to document air sampling/monitoring needs, and instruments are being evaluated in light of these needs. The steps used to develop this program and the technical basis for instrument placement are described.

16654 (CONF-9304128–, pp. G.27-G.45) **Calibration and operation of continuous air monitors for alpha-emitting radionuclides.** Hoover, M.D.; Newton, G.J. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC04-76EV01013. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Spectrometer-based continuous air monitors have improved our capabilities for detecting aerosols of alpha-emitting radionuclides. This paper describes basic requirements and statistical limitations in the sensitivity of alpha continuous air monitors, and presents a technical basis for selecting the energy window for detection of uranium and plutonium aerosols, correcting for interference from airborne dust, selecting filters with low pressure drop and good front surface collection characteristics, and properly using electroplated calibration sources. Sensitivity limits are described for detecting uranium or plutonium aerosols in the presence of increased concentrations of naturally occurring, alpha-emitting radon progeny radionuclides. Decreasing the lower energy boundary of the detection window from 4.3 MeV to 2.7 MeV improves by a factor of three the detection of plutonium in the presence of dust, while causing minimal additional interference from ambient radon progeny. Selection of the Millipore Fluoropore teflon membrane filter reduces both pressure drop and interference from ambient radon progeny by up to a factor of two. Field collection of ambient radon progeny can be used to verify the proper energy of alpha emissions from electroplated calibration sources. In the absence of energy verification, errors in instrument calibration may result from solid state diffusion of the electroplated calibration radionuclide into the substrate plate.

16655 (CONF-9304128–, pp. G.46-G.54) **Evaluation results of various commercial air monitors for use at the Oak Ridge National Laboratory.** Falter, K.G. (Oak Ridge National Lab., TN (United States)); Bryan, W.L.; Chiaro, P.J. Jr. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC05-84OR21400. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Air monitoring requirements have changed considerably, due to the new requirements found in the Radiological Control (RADCON) Manual, and in the Occupational Radiation Protection Rulemaking (Title 10, Code of Federal Regulations, Part 385). Many new instrument and facility evaluations have begun due to these new guidance documents. In particular, the requirements for air monitoring have been changed dramatically. An evaluation of commercially available air monitors was initiated to identify the proper system which would meet the requirements of facilities located at the Oak Ridge National Laboratory (ORNL). Various systems were evaluated, including alpha, beta, and alpha/beta air monitors. The manufacturers of these air monitors include Berthold, Canberra, Eberline, and Ludlum. Technical evaluations of these instruments were required due to the wide range of isotopes used in the current and historical operations at ORNL. The evaluations completed at ORNL were compiled from the ANSI N42.17B-1989 entitled, "Performance Specifications for Health Physics Instrumentation - Occupational Airborne Radioactivity Monitoring Instrumentation," the requirements of the previously mentioned DOE documents, and the pertinent requirements pertaining to air monitoring at ORNL facilities. The results of these evaluations and our conclusions clearly point out that the optimum air monitor for all activities at ORNL cannot be found.

16656 (CONF-9304128–, pp. G.55-G.59) **Alternative concepts for design of air monitoring instruments: In-line and open face reference samplers and a new method of demonstrating alpha CAM performance.** Rodgers, J.C. (Los Alamos National Lab., NM (United States)); McFarland, A.R. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Over the past several years Los Alamos, Texas A&M University and Canberra Instruments have been collaborating on the development of advanced continuous air monitoring and air sampling concepts and technology. We have successfully completed the design of an alpha CAM which embodies a number of innovations in the way radon progeny background interference is controlled and compensated, and in the way data processing, alarm generation, and data communication are handled.

16657 (CONF-9304128–, pp. G.8-G.13) **CAM correlation to fixed air sample data at Los Alamos National Laboratory.** Whicker, J. (Los Alamos National Lab., NM (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Continuous air monitoring instruments (CAMs) deployed in laboratories in the TA-55 plutonium facility at Los Alamos National Laboratory (LANL) alarmed less than 33 percent of the time when

fixed air sample measurements in the same laboratory showed integrated concentrations exceeding 500 DAC-hrs. The purpose of this study was to explore effects of non-instrument variables on alarm sensitivities for properly working CAMs. Non-instrument variables include air flow patterns, particle size of released material, and the energy of the release. Dilution Factors (DFs) for 21 airborne releases in various rooms and of different magnitudes were calculated and compared. The median DF for releases where the CAM alarmed was 13.1 while the median DF for releases where the CAM did not alarm was 179. Particle sizes ranged considerably with many particles larger than 10 μm. The cause of the release was found to be important in predicting if a CAM would alarm with releases from bagouts resulting in the greatest percentage of CAM alarms. The results of this study suggest that a two-component strategy for CAM placement at LANL be utilized. The first component would require CAMs at exhaust points in the rooms to provide for reliable detection for random release locations. The second component would require placing CAMs at locations where releases have historically been seen. Finally, improvements in CAM instrumentation is needed.

16658 (CONF-9304128–, pp. I.3-I.6) **Off-site contamination at Oak Ridge National Laboratory.** Setaro, J.A. (Oak Ridge National Lab., TN (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

An upgrade of the radioactive liquid waste system at Oak Ridge National Laboratory (ORNL) had been underway for the past several years. One of the upgrades involves the construction of a Monitoring and Control Station (MCS) which will receive waste from an analytical chemistry building prior to the waste being discharged to the main waste processing area. The MCS was located in a radiologically clean area adjacent to the analytical chemistry facility and no monitoring of personnel was necessary. On December 29, 1992, workers became contaminated and left the site prior to the discovery of the contamination. This paper outlines the actions surrounding this event including: the discovery of contamination; actions taken to minimize the spread of contamination; fears of employees; public relations; and lessons learned.

16659 (CONF-9304128–, pp. I.7-I.12) **Program enhancements resulting from the off-site contamination event.** Jarvis, J.S.; Meiners, S.E. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides information relating to an offsite contamination event at the Paducah Gaseous Diffusion Plant and describes some of the general program enhancements resulting both directly and indirectly from that incident. Workers not routinely assigned to the facility, but certified to operate the facility, received contamination on their skin, and on company issued clothing. The contamination was carried to other areas of the building into non-radiological areas and eventually contaminated a few items of personal clothing, although the levels were below allowable release limits. Underlying causes of the contamination included personnel who performed the required frisking upon exit from the radiological area, but did not recognize or acknowledge the alarm monitor while frisking. In general, the workers had a poor understanding of radiological controls and their application. Worker attitude was no appropriate and inadequate training was also a contributing factor, related to worker attitudes. Immediately following the incident numerous compensatory measures took place.

16660 (CONF-9304128–, pp. J.2-J.13) **BNL ALARA center's development of a computerized Radiological Assessment and Design System (RADS).** Dionne, B.J. (Brookhaven National Lab., Upton, NY (United States)); Connelly, J.M. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's (DOE) Office of Health Physics and Industrial Hygiene sponsored a study of Radiological Engineering Programs at selected DOE contractor facilities. This study was conducted to review, evaluate, and summarize techniques and practices that should be considered in the design phase that reduce dose and the spread of radioactive materials during subsequent construction and operation at DOE radiological facilities. As in a previous study on operational ALARA programs, a variety of "good-practice documents" will be generated. It is envisioned that these documents will serve as a resource to assist radiological engineers in the process of designing radiological facilities, and in performing radiological safety/ALARA design reviews. This paper presents the features for three good-practice documents and related software applications that are being developed based on the findings of this study. The proposed software called "Radiological Assessment and Design System" (RADS) will be a menu-driven database and spreadsheet program. It will be designed to provide easy, consistent, and effective implementation of the methodologies described in the three good-practice documents. These documents and the associated RADS software will provide the user with the following three functions: (1) enter dose assessment information and data into computer worksheets and provide printed tables of the results which can then be inserted into safety analysis reports or cost-benefit analysis, (2) perform a wide variety of sorts of radiological design criteria from DOE Orders and produce a checklist of the desired design criteria, and (3) enter cost/benefit data and qualitative ratings of attributes for various design alternatives which reduce dose into computer worksheets and provide printed reports of cost-effectiveness results.

16661 (CONF-9304128–, pp. K.15-K.28) **Dissolution rate and radiation dosimetry of metal tritides.** Cheng, Y. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC04-76EV01013. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Metal tritides including titanium tritide (Ti ^3H_x) and erbium tritide (Er ^3H_x) have been used as components of neutron generators. These compounds can be released to the air as aerosols during fabrication, assembling, and testing of components or in accidental or fugitive releases; as a result, workers may be exposed to these compounds by inhalation. A joint research project between Sandia National Laboratories and the Inhalation Toxicology Research Institute was initiated last fall to investigate the solubility of metal tritide particles, to determine retention and translocation of inhaled particles in animals, and to develop an internal dosimetry model. The current understanding of metal tritides and their radiation dosimetry for dosimetry in metal tritide form. However, a few papers in the literature suggest that the solubility of metal tritide could be low. The current radiation protection guidelines for metal tritide particles are based on the assumption that the biological behavior is similar to tritiated water which could be easily absorbed into body fluid, and therefore, a relatively short biological half life (10 days). If the solubility is low, exposure to these particles could be quite different from tritiated water. This would have significant implications in the current health protection guidelines including annual limits of intakes and derived air concentrations. The preliminary results of our metal tritide dissolution study indicated that the solubility of titanium tritide is low.

16662 (CONF-9304128–, pp. K.3-K.14) **Research in extremity dosimetry and contamination measurements.** Durham, J.S. (Pacific Northwest Lab., Richland, WA (United States)); Smith, M.H. USDOE Assistant Secretary for Environment, Safety, and Health,

Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC06-76RL01830. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Research in the fields of extremity dosimetry and contamination measurements is currently proceeding at Pacific Northwest Laboratory. The research began as a study of materials and dosimeters that could improve the detection capability and accuracy of beta dosimetry. The goal of the research is to develop improved methods of performing extremity dosimetry measurements and measurements of surface contamination. This paper describes the past accomplishments that led to the current research focus and discusses work that has been proposed for the near future. The technical basis for performing the research is also provided.

16663 (CONF-9404248–1) **Mice, myths, and men.** Fry, R.J.M. (Oak Ridge National Lab., TN (United States). Biology Div.). Oak Ridge National Lab., TN (United States). [1994]. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From National Council on Radiation Protection and Measurement (NCRP) conference; Bethesda, MD (United States); 6 Apr 1994. Order Number DE95008784. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses some examples of how different experimental animal systems have helped to answer questions about the effects of radiation, in particular, carcinogenesis, and to indicate how the new experimental model systems promise an even more exciting future. Entwined in these themes will be observations about susceptibility and extrapolation across species. The hope of developing acceptable methods of extrapolation of estimates of the risk of radiogenic cancer increases as molecular biology reveals the trail of remarkable similarities in the genetic control of many functions common to many species. A major concern about even attempting to extrapolate estimates of risks of radiation-induced cancer across species has been that the mechanisms of carcinogenesis were so different among different species that it would negate the validity of extrapolation. The more that has become known about the genes involved in cancer, especially those related to the initial events in carcinogenesis, the more have the reasons for considering methods of extrapolation across species increased.

16664 (DOE/ER–0645) **Summaries of fiscal year 1994 projects in medical applications and biophysical research.** US-DOE Office of Energy Research, Washington, DC (United States). Medical Applications and Biophysical Research Div. Apr 1995. 123p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010405. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides information on the research supported in Fiscal Year 1994 by the Medical Applications and Biophysical Research Division of the Office of Health and Environmental Research. A brief statement of the scope of the following areas is presented: dosimetry; measurement science; radiological and chemical physics; structural biology; human genome; and medical applications. Summaries of the research projects in these categories are presented.

16665 (DOE/ER/60960–T1) **Activities of the National Academy of Sciences in relation to the Radiation Effects Research Foundation. Progress report, June 1, 1993–September 30, 1994.** Edington, C.W. National Academy of Sciences - National Research Council, Washington, DC (United States). Nov 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER60960. Order Number DE95010176. Source: OSTI; NTIS; INIS; GPO Dep.

In the past sixteen months, research in all areas at RERF has continued and important progress has been made in our understanding of the late somatic and genetic effects resulting from exposure of this human population to radiation from the atomic bombs. Evidence of this productivity is emphasized by the fact that 66 papers have been published in the scientific literature over the past one and one-half years. In addition, a number of others are in press. The continued follow-up of the various RERF study cohorts is of considerable importance because greater than 50 percent of the survivors in the Life Span Study (LSS) cohort are still alive, and over 80 percent of those alive were under the age of 30 at the time of the bomb. Since evidence obtained to date indicates that individuals exposed at a young age are more sensitive to radiation than those exposed at older ages, it is important that surveillance of the RERF population continue to ascertain the late health effects that will occur in the more sensitive segment of the exposed population which is just now reaching the cancer-prone age.

16666 (DOE/NV/11432–163) **The 1993 baseline biological studies and proposed monitoring plan for the Device Assembly Facility at the Nevada Test Site.** Woodward, B.D.; Hunter, R.B.; Greger, P.D.; Saethre, M.B. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Feb 1995. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-94NV11432. Order Number DE95007960. Source: OSTI; NTIS; GPO Dep.

This report contains baseline data and recommendations for future monitoring of plants and animals near the new Device Assembly Facility (DAF) on the Nevada Test Site (NTS). The facility is a large structure designed for safely assembling nuclear weapons. Baseline data was collected in 1993, prior to the scheduled beginning of DAF operations in early 1995. Studies were not performed prior to construction and part of the task of monitoring operational effects will be to distinguish those effects from the extensive disturbance effects resulting from construction. Baseline information on species abundances and distributions was collected on ephemeral and perennial plants, mammals, reptiles, and birds in the desert ecosystems within three kilometers (km) of the DAF. Particular attention was paid to effects of selected disturbances, such as the paved road, sewage pond, and the flood-control dike, associated with the facility. Radiological monitoring of areas surrounding the DAF is not included in this report.

16667 (IC–94/234, pp. 2) **Search for bioorganic compounds and organisms on Mars.** Ishikawa, Y. (Obayashi Corp., Tokyo (Japan). Space Project Dept.); Kaneko, T.; Kobayashi, K.; Kawasaki, Y.; Yanagawa, H.; Koike, J.; Oshima, T.; Saito, T.; Yamamoto, T. International Centre for Theoretical Physics, Trieste (Italy); Commission of the European Communities, Brussels (Belgium); International Centre for Genetic Engineering and Biotechnology, Trieste (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); International Science Foundation. Aug 1994. (CONF-9408232–: Conference on the structure and model of the first cell. The Alexander Ivanovich Oparin 100th Anniversary Conference, Trieste (Italy), 29 Aug - 2 sep 1994). From the experiment with accelerator beams, simulating interactions of cosmic rays with atmosphere in primitive planets and satellites, we concluded that the bioorganic compounds like amino acids is easily formed in a simple gas mixture by bombarding charged particles, even if they are not a strongly deduced gas such as CH_4 and HN_3. Organic compounds might be formed in primitive Mars, because a substantial amount of water had existed in Mars 4 billion years ago. On the other hand, we found that cosmic rays is one of the most effective energy source for chemical evolution not only in the heliosphere as well as in interstellar space. Although neither organic compounds nor organisms were detected in Mars by Viking in 1970's, we cannot exclude their existences in Mars. Because, the soil samples, which were collected from the Mars surface, might be irradiated by ultraviolet sunlight and might be strongly oxidizing soils. We plan to send a new instrument to the places where the traces of water were found or near the poles of Mars. The proposed instrument consists of a quadrupole mass spectrometer to detect chemical compounds and a fluorescent microscope system to detect organisms (cells) and bioorganic compounds in bulk. We propose to carry out this program as an international cooperative work with scientists and technicians in the world, who are interested or already working in this field. (author). Abstract only.

16668 (IC–94/308) **Damages induced to the eye lens crystallins after treatment with beta radiations from Sr^{90}.** El-Refaei, F.M. (International Centre for Theoretical Physics, Trieste (Italy));

Gamal, M.M.; Fadel, M.A. International Centre for Theoretical Physics, Trieste (Italy). Dec 1994. 23p. Order Number DE95627782. Source: OSTI; NTIS (US Sales Only); INIS.

In this work, one of the two eyes of New Zealand rabbits from both sex were irradiated with β-particles from Sr^{90} source to 10, 20, 40 and 60 Gy. Also, the effect of β-particles on the lens after 3 months of exposure to 20 and 60 Gy was studied. The changes in the molecular structure of the crystallin lens for the treated and the untreated eyes were measured through the use of gel permeation chromatography. The electrophoretic mobility was also studied. The results indicated that both treated and untreated lenses were suffered pronounced injuries in protein structure. No recovery occurred after 3 months of exposure to 20 and 60 Gy. (author). 9 refs, 12 figs, 1 tab.

16669 (IC–94/309) **Changes induced to eye lens membrane characterization after treatments with beta radiation from Sr^{90}.** El-Refaei, F.M. (International Centre for Theoretical Physics, Trieste (Italy)); Morris, M.; Gamal, M.M.; Fadel, M.A. International Centre for Theoretical Physics, Trieste (Italy). Dec 1994. 26p. Order Number DE95627783. Source: OSTI; NTIS (US Sales Only); INIS.

The effect of β-particles on Na^+ and k^+ content, Na^+-k^+ ATPase and histopathological changes of cell membrane were studied in the present work. One of the two eyes of New Zealand rabbits from both sexes were irradiated with β-particles from Sr^{90} source to 10, 20, 40 and 60 Gy. The effect of β-particles on lens membrane after 3 months of exposure to 20 and 60 Gy was also studied. The results indicated that the treated and untreated eyes suffered pronounced injuries which deduced from the distribution of ATPase in comparison with the normal control which showed a decrease (reached 52%). As well as uncontrolled transport of the Na^+ and k^+ through the membrane and injuries appeared in the histopathological studies. (author). 12 refs, 15 figs, 4 tabs.

16670 (INIS-mf–14511) **Effects of low level ionizing radiation.** Habjouqa, Ammar (ed.). Ministry of Energy and Mineral Resources, Amman (Jordan). 1992. 24p. (In Arabic). Order Number DE95627790. Source: OSTI; NTIS (US Sales Only); INIS.

A discussion of the effects of low level radiation. The atomic structure of matter, types of ionizing radiation, radiation units, the biological effects of ionizing radiation, sources of ionizing radiation, the basic principles of radiation protection, and the equivalent dose limits are discussed. (author). 2 figs., 4 tabs.

Source: OSTI; NTIS (US Sales Only); INIS.

The system of measurement of gaseous and liquid releases from NPP's into the environment in Germany is described. The emissions are continuously monitored by the operators according to uniform regulations and reported to the authorities. The quality of the measurements is assured by officially commissioned experts in accordance with the federal rule. The operators' measurements are supplemented by remote monitoring system operated by the state authorities. The measured discharges are the basis for calculation of the radiation exposure of the public. 5 tabs., 10 refs. (orig.).

16677 (JAERI-Data/Code–94-016) **Development of evaluation method of collective dose of general public considering the daily life activity and time use.** Nagaoka, Toshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Saito, Kimiaki; Sakamoto, Ryuichi; Tsutsumi, Masahiro; Moriuchi, Shigeru. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 58p. (In Japanese). Order Number DE95768149. Source: OSTI; NTIS; INIS.

A code for evaluation of collective dose of general public to natural radiation has been developed, in which the variation of dose rate due to place of stay is taken into consideration. Only external exposure to natural radiation is subject to discussion in this report. Strict manner of dose evaluation requires the dose rate and the time period of stay for each place and for each person. It is possible to know (measure) them all, but not practicable. In this code, dose rate information was obtained from actually measured data by the authors and estimation based on the environmental conditions. Information on the time period of stay was obtained from a Survey Data on Time Use and Leisure Activities by Management and Coordination Agency, and from Statistical Yearbook of Tokyo with some realistic assumptions. By using them, collective dose was evaluated taking both the daily life style and dose rate varying place by place into consideration. In this report, the dose evaluation code and the results about doses for Tokyo citizens are mentioned. (author).

16678 (JAERI-Review–94-007) **Health physics in JAERI No.36. April 1, 1993 - March 31, 1994.** Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 281p. (In Japanese). Order Number DE95768158. Source: OSTI; NTIS; INIS.

In the annual report No.36(fiscal 1993) are described the activities of health physics in Tokai Research Establishment, Naka Fusion Research Establishment, Takasaki Radiation Chemistry Research Establishment, Oarai Research Establishment, Mutsu

Establishment and Nuclear Ship Mutsu. In all the establishments, radiation monitoring in nuclear facilities, individual monitoring, environmental monitoring and maintenance of monitoring instruments were carried out as in the previous years. There were no occupational exposure exceeding the effective dose equivalent limit and no release of radioactive gaseous and liquid wastes beyond the release limits specified in the regulations. In the environment, no abnormal radioactivity was detected attributable to the facilities. Technology developments were made as in the previous years for improving the techniques and methods of monitoring of individuals, facilities and environment, and also radiation measurement instrumentation. The research works were carried out in various fields such as radiation dosimetry, environmental monitoring, and so forth. (author).

16679 (LA-UR–95-175) **Alpha characterization of concrete surfaces at Decontamination & Decommissioning (D&D) sites.** Vu, T.Q.; Rawool-Sullivan, M.W.; Koster, J.; Stout, D.; Beasinger, A. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950216–113: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006331. Source: OSTI; NTIS; INIS; GPO Dep.

Waste minimization and worker protection at D&D sites requires continual and extensive characterization for radioactive contamination. Contamination detectors that are sensitive, rugged, fast, and capable of covering large areas are needed. The concrete surface monitor (CSM) developed at LANL supports both characterization and waste minimization efforts at D&D sites containing large concrete surfaces and structures of different forms and shapes. This report describes the CSM design and the results of several field experiments.

16680 (NIRS-R–25, pp. 2-6) **Characterization of elements in marine organisms.** Ishii, Toshiaki (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Characterization of elements was carried out to clarify the mechanisms of bioconcentration and the physiological roles of elements in marine organisms. The concentrations of ^{238}U in fifty-five species of marine organisms were measured by inductively coupled plasma mass spectrometry. The concentrations of ^{238}U in soft tissues of marine animals ranged from 0.076 to 500ng/g wet wt. Especially, the branchial heart of cephalopod molluscs showed the specific accumulation of ^{238}U. The concentration factor of the branchial heart of Octopus vulgaris, which indicated the highest value, was calculated to be about 10^3 by comparing it with the concentration of ^{238}U (3.2 ± 0.2ng/ml) in coastal seawater of Japan. The concentrations of ^{238}U of twenty species of algae ranged from 10 to 3700ng/g dry wt. (author).

16681 (NIRS-R–25, pp. 7-9) **$^{239,240}Pu$ and ^{137}Cs concentrations in coastal marine organisms.** Nakamura, Kiyoshi (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Nagaya, Yutaka; Yamada, Masatoshi. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Several marine biological samples were collected from the Pacific coasts of Ibaraki and Aomori Prefecture in 1987 to 1991. Ash samples were digested with hot nitric acid, and $^{239, 240}Pu$ and ^{137}Cs were purified by ion exchange processes, then their alpha and beta radioactivities were measured. $^{239, 240}Pu$ contents by coastal fishes were higher in viscera, and muscle usually showed the lowest value. On the contrary, ^{137}Cs contents were rather higher in muscle. The differences of radionuclide concentrations were found among species, but no definite regional variation was observed between the Ibaraki and Aomori coasts. $^{239, 240}Pu$ concentration in fish was not found to be a good indicator for pollution of marine environment, because it is very low. ^{137}Cs contents of pelagic fishes showed clear difference between warm water species and cold water ones. Concentrations of the radionuclides in bivalves and algae were also discussed and it was indicated that their radioactivities were high enough for radioactive pollution indicator. (author).

16682 (NIRS-R–25, pp. 14-18) **Accumulation of ^{95m}Tc by marine algae and sea urchin.** Nakamura, Ryoichi (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Nakahara, Motokazu; Matsuba, Mitsue; Suzuki, Yuzuru. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

It is necessary to investigate the accumulation of technetium by marine algae popular in Japan and it is also important to examine the contribution of food to the accumulation of the nuclide by sea urchin which grazes algae. In the laboratory tracer experiment, some species of algae and sea urchin were kept separately for 7 days in sea water containing ^{95m}Tc (uptake experiment) and then transferred into non-radioactive sea water to be held for 28 days with the frequent renewal of the sea water (excretion experiment). No food was given during the uptake experiment to prevent the urchins from accumulating ^{95m}Tc through food. Another experiment was done by feeding urchins with ^{95m}Tc labeled algae in the non-radioactive sea water. Five species of brown algae showed CFs in the range of 900 and 35000 but CFs of green and red algae were 1-4. Sea urchin accumulated more ^{95m}Tc through food (brown algae) than directly from sea water, so that the main pathway of technetium accumulation by sea urchin was estimated to be brown algae which were the most favorite food of the organism. (author).

16683 (NIRS-R–25, pp. 19-23) **Concentration parameters for radionuclides by marine molluscs.** Nakahara, Motokazu (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Makamura, Ryoichi; Suzuki, Yuzuru; Matsuba, Mitsue. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Accumulation of radionuclides from seawater and from food by marine molluscs was observed in the laboratory experiments to get bioconcentration parameters for the nuclides. The radionuclides investigated were ^{57}Co, ^{95m}Tc, ^{103}Ru, ^{137}Cs, ^{65}Zn and ^{54}Mn. Several species of molluscs containing pelecypods, gastropods and cephalopod were used for the experimental organisms. For the uptake experiment from seawater, the organisms were kept for more than seven days in radioactive seawater containing those radionuclides together. Then the organisms were transferred into nonradioactive seawater to observe the loss of the nuclides from the organisms. Biphasic loss curves were observed for all of the nuclides. Bioconcentration parameters, such as uptake rate, excretion rate, biological half-life and concentration factor at steady state were estimated from the uptake and excretion curves of the nuclides by the organisms by applying an exponential model. In the uptake experiments from radioactive food, the phytoplankton (Tetraselmis tetrathele), the brown algae (Eisenia bicyclis) and the viscera of abalone (Haliotis discus) were fed to bivalves, herbivorous gastropods and carnivorous molluscs, respectively. After single feeding of the labelled food with the nuclides, retention of the nuclides in whole body of the organisms was followed for several weeks or more. The organisms showed relatively high retention of the nuclides in whole body, except ^{137}Cs and ^{54}Mn. Retention of ^{137}Cs and ^{54}Mn in the organisms one day after feeding of radioactive food was lower than 25% of the radioactivity dosed. (author).

16684 (NIRS-R–25, pp. 24-26) **The deposition of radioiodine onto rice plant from atmosphere.** Uchida, Shigeo (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Muramatsu, Yasuyuki; Yoshida, Satoshi; Sumiya, Misako; Ohmomo, Yoichiro. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In

Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992. 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Radiation dose estimations are usually made with the aid of assessment models in which model parameters such as the transfer factors of radionuclides from one environmental compartment to another are involved. In simple models the parameters are often described as the concentration ratio of a radionuclide between two compartments, when the system is under equilibrium condition. In this paper, the authors introduce the values of the parameters of radioiodine obtained by tracer experiments. Laboratory experiments on the transfer parameters of radionuclides from the atmosphere to rice plant were carried out in the atmosphere-to-crops system (deposition pathway). It is known that the typical chemical species of gaseous iodine in the atmosphere are elemental iodine (I_2) and methyliodide (CH_3I). Deposition characteristics of both chemical species of gaseous iodine to rice grains were obtained. Mass normalized deposition velocity (V_D) and grain number normalized deposition velocity (V_S) of gaseous elemental iodine (I_2) and also methyliodide (CH_3I) on unhulled rice were measured. Both V_D and V_S of methyliodide were about one percent of those of elemental iodine. Distribution pattern of methyliodide between unhulled rice and brown rice was significantly lower than that of elemental one. For wet deposition, we investigated the retention of radioiodines (iodide [I^-] and iodate [IO_3^-]) on rice grains and their translocation from the surface of the grains to brown rice. Though the ears were dipped into the solution containing $^{125}I^-$ or $^{125}IO_3^-$ more than 15 min., both iodine species in the solutions were hardly taken up to the rice grains. Transfer rates of iodide and iodate, which are defined as 'the amount of the iodine in brown rice' divided by 'the amount of iodide in unhulled rice' were about 0.015 and 0.04. The rates were not changed with time after the radioiodine application.

16685 (NIRS-R–25, pp. 27-30) **Transfer of I-129 from soil to rice plants.** Muramatsu, Yasuyuki (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Uchida, Shigeo; Yoshida, Satoshi; Sumiya, Misako; Nakajima, Toshiyuki; Ohmomo, Yoichiro. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

When making an environmental safety assessment it therefore is necessary to study the transfer of iodine to agricultural crops. Because of high rice consumption in Japan and other Asian countries particular attention must be paid to rice plants. Radiotracer experiments on the transfer of ^{125}I (half-life 60 days) in the soil-rice plants systems have been carried out. Two typical soil types in Japan, Andosol and Gray lowland soil, were used in the experiment. The soil-plant transfer factors, which are defined as 'concentration of the nuclide in a plant organ' divided by 'concentration of the nuclide in a dry soil', were 0.002-0.0007 for brown rice (unhulled rice) and 0.5-3.2 for flag leaves. It was observed that the transfer factors were, in general, higher in Andosol than in Gray lowland soil. The ratio of radioiodine in brown rice to polished rice was about 1:0.3. The transfer factors for polished rice was estimated to be 0.001-0.002. Most of the radioiodine tracer added to the soil was absorbed by the soil phase at the beginning of the experiment. However, the iodine started to desorb into the soil solution with the growth of rice plants. This suggested that root exudates and/or artolysis might be participated in the desorption process. The iodine desorption was enhanced markedly by the addition of organic substances such as straw pieces and glucose to the soil. Eh dropped considerably after the soil was waterlogged due to microbial metabolisms. A reverse correlation was seen between the desorption ratios and soil Eh. Iodine was found to be volatilized from soil-plant system as gaseous organic iodide. Iodine emission was highly stimulated by plant cultivation.The chemical species of iodine volatilized was identified as methyl iodide (CH_3I) from gas chromatography. (J.P.N).

16686 (NIRS-R–25, pp. 31-34) **Transfer factors of technetium from soil to various agricultural products.** Yanagisawa, Kei (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Laboratory experiments of the transfer of technetium from soil to various kind of agricultural products have been carried out. The soil to plant transfer factors of Tc for rice plants were $\leq$ 0.005 for the grains and about 1.1 for the lower leaf blade. In contrast to this, higher transfer factors were found for wheat plants i.e. 0.027 for the grains (hulled) and 230 for the lower leaf blade. The Tc concentrations in the grains of both plants were lower than in the leaves. In the case of vegetables, transfer of technetium form soil to edible parts of vegetables have also been studied. Transfer factors of Tc for leaf vegetables such as spinach and komatsuna were considerably higher than those for non-leaf vegetable (e.g carrot, onion, sweet potato, tomato). Values for cabbages and Chinese cabbages were intermediate. Older leaves contained higher Tc than younger ones. It was suggested that Tc was readily taken up through roots and transported with water into leaves without any significant deposition in roots and stems. Technetium accumulated in leaves, while water was transpired from the leaves. This nuclide was associated strongly with constituents in leaves and hardly translocated into the other parts of the plants such as tubers, bulbs and fruits. The transfer factors (on a wet weight basis) in edible parts of vegetables obtained in this study were as follows; cabbage: 0.3, Chinese cabbage: 0.1, spinach: 2.4, komatsuna: 1.1, carrot: 0.3, onion: 0.05, sweet potato: 0.03 and tomato: 0.03. (author).

16687 (NIRS-R–25, pp. 41-49) **Transfer of long-lived radionuclides from diet to man and their body content and physiological characteristics of Reference Japanese Man.** Kawamura, Hisao (National Inst. of Radiological Sciences, Nakaminato, Ibaraki (Japan). Nakaminato Lab. Branch Office); Shiraishi, Kunio; Igarashi, Yasuhito; Yamamoto, Masayoshi; Tanaka, Gi-ichiro. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Intake and body content of actinides (Pu, Th, U) and a related alpha-emitting nuclide (Ra) were studied along with physiological aspects of Reference Japanese Man as the basic model for dosimetry. The ultimate purpose of the program was to examine applicability of the ICRP models and parameters (for workers) to members of the public. The result of an interlaboratory comparison of ^{239}Pu+^{240}Pu determination including our result was published. Alpha spectrometric determinations of ^{226}Ra in bone yielded representative adult bone concentration levels in Tokyo, 0.42 (mean) and 0.35 (median) mBq/g ash. The Ra-Ca O.R. (bone-diet) was obtained which was similar to the values in Sapporo and Kyoto. Specific effective energies for alpha radiation from ^{226}Ra and its daughters were calculated using the ICRP dosimetric model for bone and masses of source and target organs of Reference Japanese Man. Annual dose equivalents in red marrow and bone surfaces were 10 and 145 μSv as estimated from the median adult bone Ra concentration. Diet samples collected by the duplicate portion method from 31 locations in Japan in summer and winter, 1981-2 were analysed for ^{232}Th and ^{238}U by the newly developed ICP-MS technique. The daily intake per person of ^{232}Th and ^{238}U were 1.7 and 8.8 mBq, respectively. Using IDES with Japanese physical parameters and other parameters of ICRP, weighted dose equivalent commitments for single year intakes were estimated as 0.4 μSv for ^{232}Th and 0.3 μSv for ^{238}U. Reference Japanese data including the adult, adolescent, child and infant of both sexes was extensively studied by Tanaka as part of the activities associated with the ICRP Task Group on Reference Man Revision. Normal data on the physical measurements, mass and dimensions of internal organs and body surfaces and some of the body composition were analyzed in relation to the nutritional conditions of the Japanese population. (J.P.N.).

16688 (NIRS-R–25, pp. 50-55) **Experimental study on biokinetics of radionuclides in age groups.** Nishimura, Yoshikazu (National Inst. of Radiological Sciences, Chiba (Japan)); Takeda, Hiroshi; Yukama, Masae; Inaba, Jiro; Joshima, Hisamasa; Ichikawa, Ryushi. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

In the aftermath of the Chernobyl accident, it becomes evident that dose coefficients for members of the public are necessary. International Commission on Radiological Protection (ICRP) established a task group of Committee 2 charged with the assessment of dose coefficients as a function of an individual's age. However, little data is available on the biokinetics of radionuclides in juvenile and is a need to develop age-dependent biokinetic models, such as for the gastrointestinal tract. The present paper reviewed an outline on characteristics of biokinetics of radionuclides in juvenile animals focusing on the previous experimental data. The following radionuclides are discussed: ^{54}Mn, ^{60}Co, ^{65}Zn, ^{75}Se, ^{106}Ru, ^{110m}Ag, ^{115}Cd, ^{125}Sb, ^{137}Cs, ^{141}Ce, ^{203}Hg and ^{3}H. Generally, intestinal absorption and whole-body retention of radionuclides in Juveniles were higher than that of adult. In the case of sucklings, it is very important to study how radionuclides are transferred through the placenta and milk. The transfer rate of radionuclides through the placenta and milk is dependent on the period of gestation at the time of dosing. The IDES (Internal Dose Estimation System) which is based on the ICRP model was used for dose calculation. We modified the IDES using the biokinetic data which was gained by animal experiment. The IDES is flexible because the absorbed dose can be calculated by substituting arbitrary physical and physiological parameters and also substituting ingested dose coefficients not only for the ICRP Reference Man, but also for Japanese of 1 year old, 5 years old, 10 years old, 15 years old and the adult, respectively. (author).

A computer program named IDES is developed by BASIC language for a personal computer and translated to C language of engineering work station. The IDES carries out internal dose calculations described in ICRP Publication 30 and it installs the program of transformation method which is an empirical method to estimate absorbed fractions of different physiques from ICRP Reference-man. The program consists of three tasks: productions of SAF for Japanese including children, productions of SEE, Specific Effective Energy, and calculation of effective dose equivalents. Each task and corresponding data file appear as a module so as to meet future requirement for revisions of the related data. Usefulness of IDES is discussed by exemplifying the case that 5 age groups of Japanese intake orally Co-60 or Mn-54. (author).

16690 (NIRS-R–25, pp. 62-66) **Phantoms for calculations of absorbed organ dose.** Takeshita, Hiroshi (National Inst. of Radiological Sciences, Chiba (Japan)); Yamaguchi, Hiroshi; Hongo, Shozo; Iwai, Satoshi; Iwai, Kazuo. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). Order Number DE95747891. Source: OSTI; NTIS; INIS.

We have developed a computer code IDES (Internal Dose Estimation System). In this code, MIRD Transformation Method is used and photon simulation by Monte Carlo method is also possible. We have studied Japanese phantoms in two procedures, mathematical phantom and 'symbol phantoms'. Our mathematical phantoms realize their height and body weights but does not hold some of organ weights, which were measured by TANAKA and KAWAMURA. The symbol phantom can solve this discrepancy and realize a realistic phantom, although it remains problems of authorization and normalization. Errors were estimated for internal dose calculations and it was pointed out that to use realistic organ weights and parameters of kinetics was important competitively to reduce uncertainty of the results. (author).

16691 (NIRS-R–25, pp. 67-74) **Estimation of collective effective dose equivalent from environmental radiation and radioactive materials in Japan. A preliminary study.** Maruyama, Takashi (National Inst. of Radiological Sciences, Chiba (Japan)); Noda, Yutaka; Takeshita, Mitsue; Iwai, Kazuo. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). Order Number DE95747891. Source: OSTI; NTIS; INIS.

The peaceful uses of nuclear power and radiations have been developed into a stage of practical applications for human life. Radiation causes harmful effects to human beings, although human beings receives a number of invaluable benefits from the nuclear energy and the uses of radiation. In order to examine the optimization of radiation protection in these practices, collective effective dose equivalent from environmental exposures due to natural and artificial radiations have been preliminarily evaluated using most recent data. The resultant collective doses were compared with those from medical and occupational exposures. It is noted that, in Japan, the collective effective dose from environmental radiation sources can be approximately same to that from medical exposure. (author).

16692 (NIRS-R–25, pp. 75-79) **Estimation of internal dose from radiocesium and phantom.** Uchiyama, Masafumi (National Inst. of Radiological Sciences, Chiba (Japan)); Nakamura, Yuji. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

A complicated model describing the movement of a radionuclide in both the natural environment and socioeconomical systems is usually used to estimate the internal dose to the public in terms of collective dose, taking demographic data into account. The result can be certified for reliability in some compartments of the model. One of the compartments is the body content. In the case of radiocesium, the individual body burden can be measured using a whole-body counter. The measurement must be calibrated with a phantom. The public is composed of individuals of various ages. Accordingly, the whole-body counter should be calibrated with a set of phantoms approximating individuals of different body sizes. Relationships between counting efficiency and body size were analyzed on ^{137}Cs ^{134}Cs or ^{40}K incorporated into the whole-body using a set of phantoms. Four sizes covering average Japanese physiques from infant to adult male, were chosen to prepare an anthropomorphic phantom system. The distribution of ^{137}Cs in aquatic solution was homogeneous through the phantom. A whole-body counter at the National Institute of Radiological Sciences, was used at a rate of 5 cm per minute in a scanning mode. The measurements were carried out in an iron room. Relations were analyzed between counting efficiency and some anthropometric parameters. The best fit was given by a linear equation of both reciprocals of height in cm and weight in kg, with a correlation coefficient of 1.00 for ^{137}Cs. The result indicates that radioactivity of ^{137}Cs can be determined for individuals with different anthropometric parameters using the whole-body counter system. This means that effective equivalent doses for individuals can be computed accurately from the measurements. Further, an estimate on the body content from an dose estimation model using measurements of radioactivity in environmental substances can be evaluated by comparing the body burden measured. (J.P.N.).

16693 (NIRS-R–25, pp. 80-88) **A study on environmental parameters which affect external and respiratory dose.** Fujitaka, Kazunobu (National Inst. of Radiological Sciences, Chiba (Japan)); Furukawa, Masahide; Matsumoto, Masaki; Abe, Michiko; Abe, Siro. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). In *Final report on the project research 'assessment of radiation exposure of the public to radioactivities related to the environment and food chain'. April 1988 - March 1992.* 93p. Order Number DE95747891. Source: OSTI; NTIS; INIS.

Environmental parameters which affect external and respiratory dose of the public were studied. As radon is the largest source of the public exposure, focus was put on the meteorological parameters such as air motion and rain which directly affect radon concentration in the air. The air motion was monitored through long-period observations of atmospheric ^{7}Be activity, and the size distribution of airborne radioactivities, which affects the magnitude of actual dose, was also monitored through ^{7}Be measurements by the use of low-pressure type impactors. The rain was studied mainly from a viewpoint of its scavenging effect on atmospheric radon daughters. Analyses of data obtained by a high-sensitive rainmeter along with a NaI(Tl) scintillation dosemeter showed that a large enhancement of the external radiation level is caused by wet deposition of radon daughters in the initial stage of each rain, and the increment is large when there is sufficiently a long dry period preceding the onset of the rain. Such enhancement is easily detected in case the dry period is longer than three hours. It implies that the concentration of radon daughters would recover in three hours after it is decreased by the rain scavenging. (author).

16694 (ORNL–6830) **Health and Safety Research Division. Progress report, April 1, 1993–September 30, 1994.** Berven, B.A. Oak Ridge National Lab., TN (United States). Mar 1995. 154p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009924. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Health Sciences Research Division (HSRD) is to provide a sound scientific basis for the measurement and assessment of human health impacts from radiological and chemical substances. This report summarizes the progress of the division between April 1, 1993 and September 30, 1994. In spite of a rapidly changing environment, there has been challenge, opportunity, and success during the recent 18-month reporting period. The HSRD received its 14th R7D 100 award in 1994 for Luminescence Spot Test for PCBs. In the arena of developing technology to be transferred to the private sector, the division has obtained patents on five technologies and applied for 21 invention disclosures. They have established two new Cooperative Research and development Agreements (CRADAs) with industry. Other successes and activities are presented in the appendices.

16695 (PNRI-C(AG)–94008) **Detection method for irradiated oriental fruit fly (Dacus Dorsalis) for quarantine purposes.** Yulo-Nazarea, M.T. (Health Physics Research, Philippine Nuclear Research Institute, Quezon City (Philippines)); Nato, A.Q. Philippine Nuclear Research Inst., Diliman, Quezon City (Philippines). 1994. 7p. Order Number DE95628668. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation is one of the techniques used to effectively rid fresh produce of insect pests and efficacy of radiation dose on food is measured by a probit 9 (99.9968% mortality) quarantine security. Present of suitable biochemical markers for irreversible radiation injury in insect pests could be used as convincing proofs of the efficacy of radiation dose. A biochemical marker (designated Gs-protein) for radiation injury in Oriental fruit fly, Dacus dorsalis, was detected in the SDS-PAGE profile of two-day old pupae and adult insect stage. Gs-protein is not observed in larvae and eggs. An apparent molecular weight of 109 kDa was calculated. A tyrosinase enzyme activity was observed in the soluble fraction of pupal total homogenate and SDS-PAGE-isolated Gs-protein; however, no tyrosinase activity was measured in irradiated sample. The optical absorbance of the soluble fraction from unirradiated pupal total homogenate measured at 360 nm was found to increase with time. From the results of the studies, the apparent loss of Gs-protein in irradiated larvae is likely the result of loss of melanization capability in irradiated larvae which is linked to the absence of tyrosinase enzyme. The data presented seems to establish the role of Gs-protein as a biomarker for gamma-irradiation induced deactivation of pupal development and as a convenient indicator of the effectiveness of gamma radiation as a quarantine treatment. (author). 3 refs.; 3 figs.

16696 (PNRI-C(HP)–93002) **Use of a biological marker in monitoring exposures among radiation workers.** Yulo-Nazarea, M.T. (Philippine Nuclear Research Inst., Diliman, Quezon City (Philippines)); Cobar, M.L.C.; Dy, R. Philippine Nuclear Research Inst., Diliman, Quezon City (Philippines). 1993. 8p. Order Number DE95628690. Source: OSTI; NTIS (US Sales Only); INIS.

With the introduction of more modern nuclear technology in nuclear medicine, there is an increased possibility for radiation exposure among workers handling nuclear materials which calls for the autoradiographic assay of Albertini's mutation assay for hypoxanthine guanine phosphoribosyl transferase (HGPRT). An in vivo somatic mutation of HGPRT gene due to radiation exposure could be assessed using this protocol. Favorable growth of lymphocytes in culture requires activated fetal bovine serum (FBS) in RPMI 1640 medium. Phytohemagglutinin (PHA) specifically stimulates maximum proliferation of lymphocytes. Thioguanine, an anti proliferative agent, was used to screen for the presence of mutation at the HGPRT gene in which cells having mutation at the HGPRT gene locus survive the inhibitive condition. Twenty-three samples were analyzed from radiation (14) and non-radiation (9) workers. Mutation index values greater than 0.4 have been found to be higher among radiation workers (21%) than among non-radiation workers (11%). The study will facilitate the screening procedure for radiation workers and thus prevent overexposure to radiation among workers. (author.). 8 refs.; 4 tabs.

16697 (PNRI-C(HP)–94007) **Somatic mutation in peripheral blood lymphocytes among Metro Manila residents: indicator of exposure to environmental pollution.** Yulo-Nazarea, M.T. (Health Physics Research, Philippine Nuclear Research Institute, Quezon City (Philippines)); Cobar, M.L.C.; Endriga, M.A.; Sta Maria, E.J.; Nato, A.Q.; Eduardo, J.; Dy, R. Philippine Nuclear Research Inst., Diliman, Quezon City (Philippines). 1994. 8p. Order Number DE95628691. Source: OSTI; NTIS (US Sales Only); INIS.

Metro Manila is ranked as one of the world's most polluted cities where air quality levels are 2-3 times higher than the levels set by WHO. Development of diseases could be alleviated if early warning signs as occurrence of gene mutations are detected early enough. The adapted hypoxanthine guanine phosphoribosyl transferase (HGPRT) mutation assay measures the degree of mutation on the HGPRT gene and allows rapid evaluation of the occurrence of mutation in an individual exposed to radiation or mutagens within six months after exposure. The objective of the project is to (1) assay exposure of Metro Manila residents exposed to environmental pollution, (2) determine population groups significantly affected by pollutants and (3) construct an environmental baseline HGPRT mutation data bank specific to area in Metro Manila. A composite table of personal information of donors against mutation index in two barangays in Venezuela is presented. About 30% of the total samples are shown to have mutation index greater than 0.5. So far, the data show a slightly higher mutation rate among donors who are smokers with more than 5 hours outdoor exposure to pollutants per day than the corresponding class of non-smokers. (author). 5 refs.; 5 tabs.

16698 (RERF-CR–5-92) **Report of a workshop on the application of molecular genetics to the study of mutation in the children of atomic-bomb survivors.** Radiation Effects Research Foundation, Hiroshima (Japan). Sep 1993. 31p. Order Number DE95768256. Source: OSTI; NTIS; INIS.

A workshop, entitled 'application of molecular genetics to the study of mutation in the children of atomic-bomb survivors,' was held on November 12-14, 1991, which was presided over by Mortimer Mendelsohn and Toshiyuki Kumatori, co-chairmen of the RERF Scientific Council. The purpose of this workshop was to evaluate the status of the emerging DNA-oriented techniques for the study of mutation and to discuss possible developments that would bear upon the program. Although specific genetic follow-up studies of children of A-bomb survivors were addressed, it was clear to the participants that their discussions had much-wider implications –

most notably, the Chernobyl accidents of 1986. This report summarizes the contents of the lively 2.5-day meeting. A complete list of the invited participants is shown in the Appendix. (N.K.) 79 refs.

16699 (RERF-TR-8-92) **Dose survival of G_0 lymphocytes irradiated in vitro. A test for a possible population bias in the cohort of atomic-bomb survivors exposed to high doses.** Nakamura, Nori; Sposto, R.; Akiyama, Mitoshi. Radiation Effects Research Foundation, Hiroshima (Japan). Apr 1993. 16p. Order Number DE95768143. Source: OSTI; NTIS; INIS.

An in-vitro colony assay was employed for X-ray dose-survival studies of peripheral-blood lymphocytes from 117 Adult Health Study participants with Dosimetry System 1986 doses <0.005 Gy and from 84 participants with doses of ≥ 1.5 Gy. The mean (coefficient of variation) [CV] D_{10} values (the X-ray dose required to kill 90% of cells) for these two groups were 3.40 Gy (7.5%) and 3.34 Gy (7.8%), respectively. No statistically significant differences in their distributions were detected. In addition, neither sex nor age affected the in-vitro radiosensitivity of lymphocytes for either group or for all subjects combined. Therefore it was concluded that, as far as the G_0-lymphocyte colony assay is concerned, there is no evidence for preferential loss of individuals with higher cellular radiosensitivity among the high-dose atomic bomb survivors. However, it should be noted that the interindividual variations in cellular radiosensitivity were not large compared with the experimental variations. Consequently, the above-mentioned results should be considered due to the small heterogeneity of lymphocyte radiosensitivity among the survivors. (J.P.N.).

16700 (SAND-95-0138C) **Sensitivity analysis for RADTRAN 4 input parameters.** Mills, G.S.; Neuhauser, K.S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950646-4: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95006899. Source: OSTI; NTIS; INIS; GPO Dep.

The transportation risk analysis code, RADTRAN 4, computer estimates of incident-free dose consequence and accident dose-risk. The output of the code includes a tabulation of sensitivity of the result to variation of the input parameters for the incident-free analysis. The values are calculated using closed mathematical expressions derived from the constitutive equations, which are linear. However, the equations for accident risk are not linear, in general, and a similar tabulation has not been available. Because of the importance of knowing how accident-risk estimates are affected by uncertainties in the input parameters, a direct investigation was undertaken of the variation in calculated accident dose-risk with changes in individual parameters. A limited, representative group of transportation scenarios was used, initially, to determine which of 23 accident-risk parameters affect the calculated accident dose risk significantly. Many of the parameters were observed to have minimal effect on the output, and others were judged as "fixed" either by regulation, convention or standards. The remaining 5 variables were selected for further study through Latin Hypercube Sampling (LHS). LHS yields statistical information from observations (risk calculations) resulting from multiple input-parameter sets compiled from "random" sampling of parameter distributions. The LHS method requires fewer observations than classical Monte Carlo methods to yield statistically significant results. This paper presents the preliminary parameter study and LHS application results together with further LHS evaluations of RADTRAN input parameters.

16701 (STUK-B-STO-29) **Use of radiation and radiation practices in 1993. Events and statistics.** Havukainen, R. (ed.). Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). May 1994. 40p. Order Number DE95627832. Source: OSTI; NTIS; INIS.

In the end of the year 1993 there were in force 1740 safety licences for the use of radiation granted by the Finnish Centre for Radiation and Nuclear Safety (STUK). In addition to this there were 2100 places for dental x-ray activities in Finland. All together 12726 radiation sources and 313 radioisotope laboratories were in use. The import of radioactive substances was 3.9×10^{15} Bq and the export 2.5×10^{13} Bq. The production of short-lived isotopes was 1.3×10^{13} Bq. The monitoring of personal radiation doses was organized for 11171 workers and 1299 working places. The annual dose (the integrated readings of dosemeters) was greater than registration threshold for 24% of workers. The collective dose (the sum of the results of the dose measurements) registered to the Finnish Dose Register was 6.9 manSv; 74% belonged to the workers of nuclear power plants. The sum of the personal doses measured in 1993 were for three interventional radiologists and fifteen workers in nuclear power plants 20 mSv or more. The effective doses were in each case under the annual dose limit of 50 mSv. The effective doses for the interventional radiologists were under 20 mSv. (7 figs., 16 tabs.).

16702 (UR-102) **Index of classified reports from the University of Rochester Atomic Energy Project, January 1948 through December 1949.** Blair, H.A. Rochester Univ., NY (United States). 16703 (CONF-9409320-1) **Drought tolerance and osmotic adjustment of four deciduous tree species under altered precipitation: Preliminary results.** Shirshac, T.L. (Oak Ridge National Lab., TN (United States). Environmental Sciences Div.); Gebre, G.M.; Hanson, P.J.; Tschaplinski, T.J. Oak Ridge National Lab., TN (United States). [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Joint Society of American Foresters/Canadian Institute of Forestry national convention on physiology; Anchorage, AK (United States); 18-22 Sep 1994. Order Number DE95009132. Source: OSTI; NTIS; GPO Dep.

The degree and biochemical basis of drought tolerance and osmotic adjustment of dogwood (Cornus florida L.), white oak (Quercus alba L.), chestnut oak (Quercus prinus L.), and red maple (Acer rubrum L.) is being assessed in a mature hardwood forest using three hydrologic regimes: ambient, wet (+33% throughfall), and dry (−33% throughfall). Currently, leaf water potential, osmotic potential at saturation, and metabolite concentrations are determined monthly for trees under the three treatments. First year results show that within the dry treatment, dogwood demonstrated the highest osmotic potential at saturation (−1.2 MPa), indicating the greatest sensitivity to water stress. Increasing tolerance was evident in red maple (−1.4 MPa), white oak (−1.6 MPa), and chestnut oak (−1.9 MPa). In June, dogwood displayed a 0.12 MPa adjustment to drought, relative to the ambient control. In July, chestnut oak displayed a 0.18 MPa adjustment. This osmotic adjustment resulted primarily from fructose and glucose accumulation in dogwood, and shikimic acid and sucrose accumulation in chestnut oak.

16704 (ETDE-DE-53) **Acidification of terrestrial and aquatic ecosystems in Hessen: Causes, impacts, countermeasures.** Umweltplanung, Arbeits- und Umweltschutz. Schriftenreihe der Hessischen Landesanstalt fuer Umwelt, v. 169. Keitz, S. von. Hessische Landesanstalt fuer Umwelt, Wiesbaden (Germany); Kassel Univ. (Gesamthochschule) (Germany). Fachbereich 19 - Biologie, Chemie. 1994. 145p. (In German). Order Number DE95769152. Source: OSTI; NTIS (US Sales Only).

The work investigates the types, causes, and impact of stress from acidifying depositions on soil as well as rivers and lakes. In spite of measurable cuts in acidic depositions, far-reaching measures in the sectors of nuisance protection and forest management must be implemented in order to re-establish sound ecological cycles on a long-term basis. (MG)

16705 (ETDE-DE-73) **Signals from nature. The ten-year history of the register of ecological effects of**

Baden-Wuerttemberg. Landesanstalt fuer Umweltschutz Baden-Wuerttemberg, Karlsruhe (Germany). Oct 1994. 63p. (In German). Order Number DE95769007. Source: OSTI; NTIS (US Sales Only).

The register of ecological effects aims to weight pollutant effects in nature. In order to establish such effects, plants and animals are investigated that constitute biological indicators reacting to pollutants with visible damage or by accumulation of toxic substances. In the first part, the accumulation of inorganic pollutants (heavy metals) in different plant and animals species is investigated. In the second part, the accumulation of polycyclic aromatic hydrocarbons (PAHs), chlorinated aromatic hydrocarbons, and phthalic acid esters in different plant species is investigated. Furthermore, an investigation concept is presented by which air pollutants absorbed by filters can be tested for genotoxicity using various bioassays. In part three, reactions of vegetable and animal organisms to vapour-phase, inorganic air pollutants such as sulfur dioxide, nitrogen oxide and ozone are discussed. The pollutant sources are also mentioned in the individual sections. The development of vegetation and the condition of forest stands are discussed by means of permanent observation sites, and an investigation on organisms living in the soil (collembola) is carried through. (MG)

16706 (ETDE-DE–74) **Environmental impact and health.** Bundesministerium fuer Forschung und Technologie. Pressedokumentation, v. 18/93. Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Referat fuer Presse und Oeffentlichkeitsarbeit. 1 Dec 1993. 11p. (In German). Order Number DE95769250. Source: OSTI; NTIS (US Sales Only).

The press documentation of the BMFT (Federal Ministry of Research and Technology) presents selected examples of previous project support and interministerial working groups in short survey articles which are partly available as a brochure in a detailed form. The single subjects are 1. effects of diesel engine waste gases on the health, 2. noble metal emissions from catalytic converter vehicles, 3. dioxins, furans and polychlorinated biphenyls in the environment, 4. check of chemicals on carcinogenesis, mutagenesis, tertogenesis, 4. improvement of the air quality interior spaces, 6. the Federal Government and its Laender AG 'dioxins'. (VHE)

16707 (ETDE-DE–84) **1992 forest damage report for Hesse.** Hessisches Ministerium fuer Landesentwicklung, Wohnen, Landwirtschaft, Forsten und Naturschutz, Wiesbaden (Germany); Hessische Forstliche Versuchsanstalt, Hannoversch Muenden (Germany). Abt. Waldschaeden. 1993. 23p. (In German). Order Number DE95770347. Source: OSTI; NTIS (US Sales Only).

In its present appearance the forest shows the result of a steady decline since 1984 that has clearly become even faster during the past two years. In 1992 one third of all sample trees show marked foliar loss; one third show slight damage and only 31% are still symptom-free. In 1992 only one in ten sample trees in the age-group above 60 years show no top thinning. Every other tree in this group shows clear signs of damage. The beech is most affected by the forest decline. Only 5% of old beeches still have an intact foliage. Of all the diverse factors of influence that contribute to the appearance of trees today the weather conditions seem to have played an important role in the case of the Hessian forest ecosystems, which are also subject to a high level of anthropogenic background pollution. The recent acceleration of forest decline is also attributable to the physiological stress caused during the past few years by unusually frequent, and in 1992 particularly intense, blossom and fructification. In 1992 almost 80% of old sample trees fructified. Blossom percentage was particularly high for beech (93%) and pine (96%). In 1992 43% of old pinetrees, 42% of spruce firs, and 32% of oaks show marked damage. In the age-group below 60 years the percentages of unimpaired trees are particularly low for pinetrees and oaks. Young beeches and pinetrees, by contrast, show only minor damage; here two out of three trees are symptom-free. Yellowing is still only seen in 7% of sample trees in Hesse. Spruce firs and beeches are more affected by this than pinetrees and oaks. (orig./UWa)

16708 (GSF–7/94) **2,5-hexandione and pyrroles in human urine: Analytical determination and examination of excretion after exposure to n-hexane.** Dietz, W.G. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Inst. fuer Toxikologie; Technische Univ. Muenchen (Germany). Fakultaet fuer Chemie, Biologie und Geowissenschaften. 1994. 109p. (In German). Order Number DE95769224. Source: OSTI; NTIS (US Sales Only).

Biological monitoring of persons exposed to hexane used to rely on the concentration level of 2,5-hexanedione (HDO) in urine after acid hydrolysis (total HDO). However, severely acidic conditions (<1pH) cause 4,5-dihydroxy-2-hexanon, another hexane metabolite, to react to produce HDO, too, which will then be co-detected. The aim was to develop analytical methods for determining HDO in urine and to test them for their suitability for biological monitoring of hexane-exposed persons. In addition, a photometric method was to be used to study exposure-induced urinary excretion of pyrroles. Different from free HDO, total HDO appeared to be less suitable for biomonitoring since total HDO has much higher background concentrations and a slower excretion rate which will result in accumulation in cases of exposures on successive days. The diagnostic strength of this biomonitoring method is also weakened by the fact that a nontoxic metabolite is co-detected. The studies on the excretion of pyrrole compounds in urine showed these secondary metabolites to allow the verification of hexane exposure, too. (orig./Uhe)

16709 (Juel–2903) **Studies on the uptake and incorporation of anthropogenic nitrogen oxides (NO_x) by sunflowers and maize by using ^{15}N isotope tracers.** Segschneider, H.J. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Radioagronomie; Bonn Univ. (Germany). May 1994. 189p. (In German). Order Number DE95769214. Source: OSTI; NTIS (US Sales Only).

The aim of the present thesis was to quantify the uptake of nitrogen dioxide (NO_2) and nitrogen monoxide (NO) by sunflowers (Helianthus annuus L.) and maize (Zea mays L.) in a concentration range corresponding to the concentration range in the present atmosphere. Furthermore, work was carried out on characterizing the parameters responsible for NO_2 and NO uptake by varying the different exposure conditions. In addition by applying ^{15}N-enriched nitrogen oxides ($^{15}NO_2$; ^{15}NO) it was also possible to investigate the incorporation and distribution of the $^{15}NO_x$ nitrogen in the plants. After an appropriate cultivation phase, the plants were transferred individually into a specially designed exposure system (Latus, 1989). Quantification of the NO_2 or NO uptake was carried out by two independent measuring methods. On the one hand, the quantities of NO_2 or NO taken up by the plants were determined via the NO_2 concentration difference between the chamber inlet and outlet. On the other hand, the NO_2 and NO uptake was calculated after exposure to ^{15}N-enriched nitrogen oxides by determining the $^{15}N/^{14}N$ ratio in the exposed plants using mass spectrometry. Furthermore, by using various analytical procedures it was possible to determine the sizes of the different nitrogen pools in the plants and to evaluate them by mass spectrometry. (orig./UG)

16710 (KFK-PEF–113) **Soil ciliates (Protozoa: Ciliphora) as sensitive indicators of fundamental changes in forest ecosystems.** Lehle, E. (Ulm Univ. (Germany). Abt. Oekologie und Morphologie der Tiere). Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF). Nov 1993. 101p. (In German). Sponsored by Land Baden-Wuerttemberg, Stuttgart (Germany);Commission of the European Communities, Brussels (Belgium). Contract PEF 89/012/1A. Order Number DE95769244. Source: OSTI; NTIS (US Sales Only).

In spruce stands of the Black Forest with the bedrock of granite and new red sandstone and of the Swabian Alb on jura mountains (Southern Germany) the effects of fertilization, liming and treatment with composts on the ciliate fauna were investigated in laboratory microcosms. An improved culture method was tested for suitability in practice. In comparison with deciduous forests the ciliate communities of the investigated spruce stands were poor of species diversity. In the Black Forest sites liming or fertilization showed little changes in the species composition. On the Swabian Alb, in contrast, liming and treatment with compost, made from chopped wood, led to increased species numbers. In both investigated areas liming increased individual numbers. In contrast, fertilization led to no significant changes. The soil treatments caused partly clear differences in abundance and dominance structure.

Succession-cultures are suitable to certify such differences. Bacteriovorous species like Blepharisma hyalinum, Colpoda fastigata, Cyclidium muscicola, Gonostomum affine, Homalogastra setosa, Tetrahymena edaphoni increased on the limed areas. Halteria grandinella increased on the area treated with compost made from chopped wood. Soil ciliates are suitable bioindicators to characterise habitats and to analyse natural and anthropogenous changes in terrestrial ecosystems. (orig.)

16711 (UCRL-JC–119715) **Human health risks from TNT, RDX, and HMX in environmental media and consideration of the US Regulatory Environment.** Daniels, J.I.; Knezovich, J.P. Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411155–2: 1994 Luxembourg international symposium on the rehabilitation of military sites and demilitarization of explosive ordance, Kirchberg (Luxembourg), 14-18 Nov 1994). Order Number DE95009480. Source: OSTI; NTIS; INIS; GPO Dep.

Although the most economical method for disposing of unwanted energetic high explosives [HEs; e.g., 2,4,6-trinitrotoluene (TNT), hexahydro-1,3,5-trinitro-triazine (RDX, also known as Cyclonite), and octahydro-1,3,5,7-tetrazocine (HMX, also known as Octogen)] involves open burning and open or underground detonation [OB/O(U)D]; federal, state, and even local government agencies in the United States (U.S.) are implementing stricter environmental regulations that eventually may prevent such activities. These stricter regulations will promote alternative technologies that are designed to be environmentally benign. However, past HE-waste disposal practices at manufacturing and fabrication facilities in the U.S. have included uncontrolled OB/O(U)D, as well as direct surface discharge of HE-contaminated waste water, resulting in contaminated environmental media (e.g., ground water, soil, and perhaps even edible vegetation) near residential areas. Using TNT, RDX, and HMX as examples, this paper describes how risk-based standards for HEs can be derived that account for potential multimedia exposures (associated with contaminated air, water, food, and soil) by individuals near a contaminated site, and used to (1) protect public health and safety; (2)prevent limited resources from being dedicated to unnecessary cleanup activities; and (3) identify the most cost-effective, practical, and environmentally benign technologies suitable for integrating with the handling of the large quantity of high explosives scheduled for demilitarization.

16712 (HHS-CFR-B–9) **Risk perception and credibility of risk communication.** Sjoeberg, L. Stockholm School of Economics (Sweden). Center for Risk Research. Oct 1992. 26p. Order Number DE95627113. Source: OSTI; NTIS; INIS.

Experts and the public frequently disagree when it comes to risk assessment. The reasons for such disagreement are discussed, and it is pointed out that disagreement among experts and lack of full understanding of real risks contributes to skepticism among the public. The notion that people are in general reacting in a highly emotional and non-rational, phobic, manner is rejected. The very conditions for risk assessment present to the public, and commonsense cognitive dynamics, are better explanations of risk perception, as are some social psychological concepts. If trust is to be established in a country where it is quite low some kind of politically regulated public influence on decision making and risk monitoring is probably needed, e.g. by means of a publicly elected and responsible ombudsman. 57 refs, 8 figs, 5 tabs.

16713 (DOE/RF/00653–T1) **Demonstration, testing and evaluation of nonintrusive characterization technologies at operable Unit 2 of Rocky Flats Plant. Final report.** Enserch Environmental Corp., Richland, WA (United States). Sep 1994. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-93RF00653. Order Number DE95005771. Source: OSTI; NTIS; INIS; GPO Dep.

A three-dimensional (3-D), high-resolution (HR) seismic reflection evaluation was conducted at the Rocky Flats Plant (RFP), near Golden, Colorado, to demonstrate the applicability of nonintrusive characterization techniques to detect buried objects, contamination, and geological/hydrological features at RFP. The evaluation was conducted as part of the U.S. Department of Energy's (DOE) request for demonstration, testing and evaluation (DT&E) of nonintrusive techniques, under DOE Program Research and Development Announcement (PRDA) No. DE-RA05-09OR22000.

16714 (LA-UR–95-640) **Nonlinear elastic wave interaction in a sandstone bar: A summary of recent pulse-mode experiments.** Johnson, P.A. (Los Alamos National Lab., NM (United States)); TenCate, J.A.; Cherry, R.; McCall, K.; Van Den Abeele, K.; Kadish, A.; Shankland, T.; Guyer, R. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9506141–2: 15. international congress on acoustics (ICA), Trondheim (Norway), 26-30 Jun 1995). Order Number DE95007860. Source: OSTI; NTIS; GPO Dep.

We have performed nonlinear pulse propagation experiments in a 3.8 cm diameter rod of Berea sandstone 1.8 m long at ambient conditions. Unlike earlier studies, we measured acceleration and not displacement. Moreover, we detected 2nd and 3rd harmonic growth at smaller strain amplitudes than were observed previously (10^{-7}). Harmonic growth at identical strain amplitudes has also been noted in resonance studies using the same rock type. Current measurements are underway with the rod in vacuum where the wave attenuation is less and the conditions can be carefully controlled. Ultimately, we wish to test the validity of current analytic and numerical models for nonlinear propagation in microcracked materials.

16715 (NEI-DK–1912) **Cenozoic sequence stratigraphy in the eastern North Sea.** Michelsen, O.; Thomsen, E.; Danielsen, M.; Heilmann-Clausen, C.; Jordt, H.; Laursen, G.V. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 87p. Contract ENS-1313/92-0003. Order Number DE95766538. Source: OSTI; NTIS.

EFP-92.

The Cenozoic evolution of the epicontinental North Sea Basin is described on the basis of sequence stratigraphy, comprising analyses of seismic sections, petrophysical logs, and biostratigraphic studies of foraminifera, dinoflagellates, and calcareous nannofossils. Stratigraphic, palaeogeographic, and palaeoecological information from the Danish onshore area is integrated in the study. The deposits are subdivided into 21 sequences, which groups into seven informal major units. The sequence boundaries are identified by differences in seismic facies and by seismic onlap, toplap, and truncation features. The maximum flooding surface is placed at an internal downlap surface which correlates with high values on the gamma ray log. The source of sediments and the direction of sediment transport changed several times during the Cenozoic. Transport was mainly from the north during the Late Paleocene and Early Eocene, from the west during the Middle and Late Eocene, and from the north and northwest during the Oligocene to quaternary. The depocenters of the seven major units are generally located marginally, probably adjoining the source areas. There is only minor evidence for changes in subsidence rates in the basin. A constant rate is assumed from the Paleocene to the mid Middle Miocene. For the remaining part of the Cenozoic and increased rate is indicated. A tentative relative sea-level curve for the North Sea Basin is proposed. The overall trends of the curve

are broadly comparable with the global sea-level curve of Haq et al. Discrepancies may be caused by differences in the biostratigraphic calibrations. The most pronounced Oligocene sea-level fall is dated ot the latest Oligocene. (au) (83 refs.)

16716 (NEI-DK–1913) **Occurrence of major sequence stratigraphic boundaries in relation to basin development in Cenozoic deposits of the southeastern North Sea.** Michelsen, O.; Danielsen, M.; Heilmann-Clausen, C.; Jordt, H.; Laursen, G.V.; Thomsen, E. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 13p. Contract ENS-1313/92-0003. Order Number DE95766539. Source: OSTI; NTIS.

EFP-92.

The post-Danian Cenozoic succession in the southeastern North Sea is subdivided into seven informal 'major sequence stratigraphic units', comprising twenty-one sequences. The boundaries of the units are easily recognized seismic sections over the entire study area. The North Sea is an epicontinental basin. It underwent considerable changes during the Cenozoic as regards subsidence rates, direction of sediment transport, and position of depocentres. The six unit boundaries are interpreted to reflect some of the major events in the development of the basin. The boundary between units 1 and 2 (lowermost Eocene) is associated with a regional hiatus followed by a large relative sea-level rise, whereas the boundary between units 2 and 3 (Lower Eocene) coincides with a shift in the direction of sediment transport from north to west. The boundary between units 3 and 4 (Eocene-Oligocene transition) marks an important change in the depositional environment of the North Sea with a shift in the direction of sediment transport from west to mainly northeast. In the northeastern part of the study area, thick prograding deposits of unit 4 are situated on distal deposits of units 1, 2 and 3. The transition between units 4 and 5 (uppermost Oligocene) shows a pronounced basinward shift in onlap, and it is interpreted to reflect a major fall in the relative sea level. The boundary between units 6 and 7 (Middle Miocene) is identified on a shift from a prograding reflection pattern to an aggrading pattern. The lower part of unit 7 is interpreted to represent a starved depositional environment, related to a pronounced increase in subsidence rate. The North Sea sequences are correlated with the Danish onshore deposits. The sequence boundaries generally coincide with an unconformity in the Danish deposits. A glauconitic horizon characterises the initial deposits overlying each of the unconformities. (au) (29 refs.)

16717 (NEI-DK–1914) **Stratigraphic correlation of the Danish onshore and offshore Tertiary successions based on sequence stratigraphy.** Michelsen, O. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 17p. Contract ENS-1313/92-0003. Order Number DE95766540. Source: OSTI; NTIS.

EFP-92.

The results of a sequence stratigraphic study of the Tertiary sedimentary succession in the Danish North Sea sector, and the adjacent parts of the Norwegian, German, and Dutch sectors are reviewed in the present paper. Lithology and thickness variations of seven major sequence stratigraphic units, comprising twenty one sequences, are shortly described. The chronostratigraphic and genetic relationships between the North Sea sequences and the Danish onshore lithostratigraphic formations are emphasized. Six major sequence stratigraphic boundaries are pointed out, being time-equivalent with regional unconformities in the onshore area. The six surfaces bound five sedimentary packages, which are isochronous in their recognized lateral extension, and comprise genetically related deposits. It is suggested to define the five units as allostratigraphic units, and thus to create a stratigraphic subdivision, which is mappable in the southeastern North Sea region, possibly in the main part of the North Sea. The five allostratigraphic units can be identified in all areas by the available data: seismic sections and logs in the offshore area, and lithology in onshore outcrops and shallow wells. The definition of an allostratigraphic scheme would create a common nomenclature across the national borders and the present coastlines, and hopefully increase the accuracy of the chronostratigraphic correlation between profiles in the North Sea region. (au) (33 refs.)

16718 (NEI-DK–1915) **Seismic sequence stratigraphy of the Tertiary in the Danish North Sea. Incl. 7 structural maps of the main sequences, and 35 isochore maps of main sequences and smaller units.** Bidstrup, T. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 109p. Contract ENS-1313/92-0003. Order Number DE95766541. Source: OSTI; NTIS.

EFP-92.

The seismic sequence stratigraphic study presented in this paper is a part of an energy research project (EFP-91 'Basin Development of the Tertiary of the Central Trough with emphasis on possible hydrocarbon reservoirs'). The purpose of this part of the study is to identify and map Cenozoic sequences based on seismic data in the Danish North Sea sector. The identified sequence boundaries are tied to wells and correlated with log sequence stratigraphy and biostratigraphy. The boundaries of the major sequence stratigraphic units are mapped and isochore maps of the sequences have been made. Seismic key lines showing the individual sequences are presented and a short description of the individual sequences are also given. (au)

16719 (NEI-DK–1916) **Sequence and systems tract interpretation of the epicontinental Oligocene deposists in the Danish North Sea sector.** Michelsen, O.; Danielsen, M. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 29p. Contract ENS-1313/92-0003. Order Number DE95766542. Source: OSTI; NTIS.

EFP-92.

A sequence stratigraphic scheme has been established in the marine siliciclastic Cenozoic deposits in the southeastern North Sea Basin. The present paper addresses the problem of recognizing systems tracts by means of logs, using the Oligocene sequences as an example. The Oligocene sequences are characterized by an overall prograding seismic reflection pattern, and systems tracts can not be interpreted on the basis of seismic sections. The sequences are characterized by marine clay-dominated deposits, and abrupt changes in lithological facies are rarely seen. The gamma ray log trends indicate changes between retrograding, aggrading and prograding stacking patterns. The lowstand deposits are identified as prograding sedimentary bodies. Coarse-grained sharp-based lowstand deposits are found basinward of the depositional shoreline break of the preceding sequence, and further basinward they are more fine-grained. Fan deposits are not recognized. A thin interval of transgressive deposits including upward fining clayey sediments is found at the top of the lowstand deposits and in the landward direction at the top of the older highstand deposits. The maximum flooding surface is identified by a high gamma ray peak. The overlying highstand deposits thicken in the landward direction, and are here characterized by an upward coarsening trend. They thin in the basinward direction and become a condensed clay interval. Deposition took place during a tectonically quit period in an epicontinental basin with a gently southwestward dipping sea floor. The lowstand deposits are interpreted to reflect forced regression processes, and a deep ramp model is, therefore, suggested for these deposits. (au) (16 refs.)

16720 (NEI-DK–1917) **Oligocene sequence stratigraphy and basin development in the Danish North Sea sector based on log interpretation.** Danielsen, M.; Michelsen, O.; Clausen, O.R. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 42p. Contract ENS-1313/92-0003. Order Number DE95766543. Source: OSTI; NTIS.

EFP-92.

Five sequences are defined in the Oligocene succession of the Danish North Sea sector. Two of the sequences, 4.1a and 4.3, have been identified onshore Denmark. Two types of lowstand deposits are recognized, reflecting forced regression processes in an epicontinental basin. Proximally occur coarse-grained, sharp-based deposits and distally fine-grained, gradiational prograding deposits. The highstand deposits are proximally represented by thick prograding parasequence sets while they distally are characterized by thin and condensed intervals. The main sediment transport direction is from the north and the northeast. Additional sediment input

from a northern and a western direction is obsereved in two sequence. A succession of litho-facies, spanning from shallow marine, coarse-grained deposits to outer shelf clay, is mapped in each of the sequences. An overall south and southward progradation of the shoreline took place during the Oligocene, only interrupted by minor shoreline retreats. (au) (35 refs.)

16721 (NEI-DK–1920) **Stratigraphical correlation of late Paleocene sand deposits in the Soegne Basin and adjacent areas, Central North Sea.** Danielsen, M.; Clausen, O.R.; Michelsen, O. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 28p. Contract ENS-1313/92-0003. Order Number DE95766546. Source: OSTI; NTIS.

EFP-92.

A stratigraphic analysis of Late Paleocene sands of the Soegne Basin and the western part of the Norwegian-Danish Basin shows that the sand bodies are of different ages. The geographic distribution of the sand deposits shows that they are related to underlying Mesozoic structures suggesting a controlling effect of Tertiary tectonics on the deposition of sand during the Late Paleocene. However, the structural setting of various sand bodies varies from reactivation of older faults and reactivation of salt structures. The local character of the structures active during the Late Paleocene introduces minor depressions with no lateral connection. The sand bodies, which are interpreted as deposited in these depressions, are thus in general separate bodies with no lateral connection. The Fennoscandian shield and eroded Mesozoic sediments along the Fennoscandian Border Zone are suggested as source ares for the Late Paleocene sand deposits. (au) (39 refs.)

16722 (NEI-DK–1921) **Transitional Palaeocene-Eocene ash bearing diatomite in the eastern North Sea.** Thomsen, E.; Danielsen, M. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 10p. Contract ENS-1313/92-0003. Order Number DE95766527. Source: OSTI; NTIS.

EFP-92.

The lithology and log pattern of the Palaeocene/Eocene ash series from several wells in the northeastern part of the North Sea is described. In five of the investigated wells, the ash beds are interbedded with a diatomite which is apparently rather similar to the diatomaceous Fur Formation in northwestern Jutland. The five wells are situated in a belt stretching from the coast of Jutland towards the northwest along the southern coast of Norway, thus forming a natural continuation of the onshore diatomite. The thickness of the diatomite varies considerably, but it seems, in general, to be thinner in the North Sea than in Jutland, where the maximum thickness approaches 60 m. (au) (16 refs.)

16723 (NEI-DK–1924) **Tertiary fluvial deposits of Jylland, Addit area.** Hansen, H.C.S. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 24p. Contract ENS-1313/92-0003. Order Number DE95766530. Source: OSTI; NTIS.

EFP-92.

Sandy fluvial deposits of Tertiary age are described from three sand pits in the Addit area with up to 28 metres high outcrops. The deposits form up to 20 metres thick, fining-upwards successions of mainly large-scale, tabular cross-sets of medium and coarse-grained sand interpreted as fluvial bars. The successions are capped by thinly interbedded sands and silts and occasionally overlain by a coal bed. Concave-up bounding surfaces separate the fining-upwards successions. Channel switching, breaks in active channel aggradation, rapid scour- and filling events and chute activity created bounding surfaces that are described by a 4-tier hierarchy. The palaeocurrents derived from trough forests suggest that the channel course was straight rather than sinuous. The current directions were generally to the south and southwest. (au) (43 refs.)

16724 (NEI-DK–1925) **Low-sinuosity river deposits from the Middle Miocene quarts sands of Jylland.** Hansen, H.C.S. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 26p. Contract ENS-1313/92-0003. Order Number DE95766531. Source: OSTI; NTIS.

EFP-92.

Tertiary, very pure quartz sand deposits in central Jylland are well known by the aggregates industry. The quartz sand deposits have been referred to the Odderup Formation. The industry presently exploits the quartz sands in five pits situated on the rim of the Gudenaa valley near the villages of Addit and Voervadsbro. This report will show that the environment of deposition was a sand-rich, low-sinuosity river situated on an upper delta plain. The detailed interpretation of structures and processes will show the unequivocal fluvial nature of the Odderup Formation at Voervadsbro and Addit. Water stage variations of a river governed the formation of bedforms and characteristic successions of facies were produced. Excellent examples of deposits of fluvial bars are exposed in three of the pits. (au) (34 refs.)

16725 (NEI-DK–1926) **Contribution to the meeting 'Stratigraphy of the Paleocene'.** Thomsen, E.; Heilmann-Clausen, C.; Ali, J.R.; Abrahamsen, N. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 8p. Contract ENS-1313/92-0003. Order Number DE95766532. Source: OSTI; NTIS.

EFP-92.

The purposes of the present review are (1) to discuss the Paleocene stage boundaries relative to the current dinoflagellate zonation of the North Sea region. (2) to point out some dinoflagellate events which have proven to be reliable for correlation within the region and (3) to evaluate the possible use of these events for correlation to other regions of the world. The dinoflagellates are the single fossil group which has contributed most to the present day biostratigraphical resolution of the Paleocene in the North Sea Basin. This is especially the case in the Selandian and Thanetian where most other fossil groups are restricted to certain stratigraphical intervals or lithologies. (au)

16726 (NEI-DK–1927) **Paleogene radiolaria and diatoms from three exploration wells from the Central Graben, North Sea (Danish Sector): stratigraphic and palaeoenvironmental significance.** Jutson, D. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 104p. Contract ENS-1313/92-0003. Order Number DE95766533. Source: OSTI; NTIS.

EFP-92.

The results from the biostratigraphic analyses of radiolarian, and foraminiferal microfaunas and diatom microfloras from the Paleogene interval of three wells from the North Sea are presented in this report. The wells used in the study were Mona-1, Bertel-1 and Iris-1, all from the Danish Sector. The aim of the study was to record and taxonomically determine radiolaria and diatoms and to compare their distribution with established foraminiferal zonations to estimate their potential for enhancing stratigraphic and paleoenvironmental interpretations as part of the EFP-92 Tertiaer Bassinudvikling project. (au) (3 maps., 38 refs.)

16727 (NEI-DK–1928) **Linde-1 borehole: Paleogene dinocysts, palynofacies and stratigraphy.** Heilmann-Clausen, C. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 44p. Contract ENS-1313/92-0003. Order Number DE95766534. Source: OSTI; NTIS.

EFP-92.

The Linde-1 borehole is situated in western Jylland. It was drilled on the Linde salt-structure in 1979-80 in order to investigate the possibility of using the salt for disposal of nuclear waste material. The salt turned out to occur at a much deeper level than expected. However, the borehole yields useful information on the stratigraphy in western Jylland. The results from Linde-1 are given in three reports. The present report is primarily a biostratigraphical analysis. It covers the entire Paleogene (except lower-middle Danian) and is based on dinocysts of side-wall cores and cores. It is the first documentation of dinocyst distribution in the upper Paleogene of Denmark. Further, the report presents a lithostratigraphical and chronostratigraphical interpretation of the section. A brief palynofacies description and palaeoenvironmental interpretation is also

included. Finally the position of the North Sea sequence boundaries, as determined on the basis of the borehole data, and the meager results of the seismic study are shortly reported. Two separate reports contain foraminifera and calcareous nannofossil results of the upper Paleogene. (EG) (6 maps., 23 refs.)

16728 (NEI-DK–1929) **Ecocene and Oligocene calcareous nannofossil biostratigraphy in the Linde-1 and Borg-1 boreholes.** Thomsen, E. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 17p. Contract ENS-1313/92-0003. Order Number DE95766535. Source: OSTI; NTIS.

EFP-92.

The Linde-1 and Borg-1 boreholes are located in western Jutland in an area intermediate between the Cenozoic outcrops of northern and eastern Jutland and the wells in the eastern North Sea. They are important in order to establish a correlation between the sequence stratigraphy subdivision of the North Sea and the lithological subdivision of the Danish land area. Linde-1 is situated about 10 km northwest of Holstebro, Borg-1 about 10 km north of Toender and some 160 km south of Linde-1. Geologically, Linde-1 is situated on a deep salt pillow in the Danish subbasin close to the northern flank of the Ringkoebing-Fyn High, while Borg-1 is situated on the southern flank of the Ringkoebing Fyn High. This report presents the results of a biostratigraphical analysis on the basis of calcareous nannofossils of the Middle Eocene to Oligocene successions in the Linde-1 and Borg-1 boreholes. The results are compared with the Viborg-1 borehole and with boreholes from the northeastern part of the North Sea. (au) (12 refs.)

16729 (NEI-DK–1930) **Foraminiferal biostratigraphy of Cenozoic sections in five wells from the Danish area.** Laursen, G.V. Aarhus Univ. (Denmark). EFP-92.

Information outlines the foraminiferal zonation and age determination in five Danish wells and the environmental changes in terms of water depth oscillations which took place in the Danish area during parts of the Cenozoic. The foraminifera reflect the general alternations in the water depth: the water depth increased from a middle to outer neritic environment in the Paleocene to an outer neritic to upper bathyal environment in the Eocene in the C-1 well. This environment generally remained stable through the transition between Eocene and Oligocene and into the Lower Oligocene. The high amount of planktic foraminifera indicate an open oceanic connection. A decrease in water depth is observed in the Lower Oligocene NSB 7b where the foraminifera indicate an environment of the inner part of the outer neritic. The foraminifera of the Upper Oligocene indicates the inner part of the outer neritic environment, but the water depth seem to decrease in the uppermost part of the Oligocene. The high relative sea level is supported by the wide geographical distribution even on the structural high (Ringkoebing-Fyn High) of Subzones NSB 8a and 8c. (au) (6 maps., 26 refs.)

16730 (NEI-DK–1931) **Correlation of Miocene North Sea sequences with the Danish land area based on foraminifera.** Laursen, G.V.; Kristoffersen, F.N. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 14p. Contract ENS-1313/92-0003. Order Number DE95766520. Source: OSTI; NTIS.

EFP-92.

In the present study comparisons are made between the Miocene North Sea sequences and the Danish onshore formations based on foraminiferal biostratigraphy. Foraminiferal faunas of four onshore borings previously analyzed have been reviewed. Biozones NSB 9 - NSB 13 of the offshore sequences were all found in the Danish Miocene formations, and the obtained results promise well for a future more detailed correlation between the North Sea and the Danish land area. (au)

16731 (NEI-DK–1932) **Detailed foraminiferal biostratigraphy of the Danish marine Miocene formations.** Laursen, G.V.; Kristoffersen, F.N. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 51p. Contract ENS-1313/92-0003. Order Number DE95766521. Source: OSTI; NTIS.

EFP-92.

The Miocene strata of eighteen boreholes from onshore Denmark have been investigated for their foraminiferal content. A dense sampling with intervals of about 0.5 metres has resulted in a very detailed biostratigraphy. Some of the boreholes were analyzed in detail, others just examined for similarities in the faunal pattern. It was possible to apply the established North Sea zonations in the present study, and owing to the dense sampling it has been possible to confirm, refine and improve these zonations. Hence, some of the established benthic zones can now be further subdivided. Furthermore, some substitute markers are introduced for as well the benthic as the planktic zonation. The chronostratigraphical allocation of the zones is reinterpreted in light of recent publications. The data showed several oscillations in the water depth during the Miocene and a correlation of these with the sequence stratigraphical framework of the Danish North Sea area is attempted. (au) (62 refs.)

16732 (NEI-DK–1933) **Neogene and Quaternary dinoflagellate cyst biostratigraphy and paleoclimatology of the Karl-1 borehole, Central Trough in the Danish North Sea area.** Poulsen, N.E. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 61p. Contract ENS-1313/92-0003. Order Number DE95766522. Source: OSTI; NTIS.

EFP-92.

The dinoflagellate cysts of Miocene-Quaternary beds of the Karl-1 borehole, Danish North Sea sector were studied for biostratigraphy and paleoecology. This report provide a revision of the dinoflagellate cyst biozonation for the Neogene-Quaternary of Costa and Manum. The revised dinoflagellate cyst zonation is used in the biostratigraphic description of the Karl-1 borehole. Paleoecological interpretations (paleodepth, paleotemperature, paleosalinity) based on dinoflagellate cysts are described in detail for the sidewall cores within the interval 6200-4200 feet. The Miocene was found to have been deposited in an outer neritic-oceanic paleoenvironment; the sea level apparently rose to a maximum near the Tortonian-Messinian boundary. The sea temperatures in the Early-Middle Miocene were subtropical, whereas the Late Miocene shows falling sea temperatures. (JT) (2 maps., 62 refs.)

16733 (NEI-DK–1934) **Neogene and Quaternary dinoflagellate cyst, foraminiferal, and molluscan biostratigraphy and paleoclimatology and paleoenvironment of the Lille Toende borehole, southern Jylland, Denmark.** Poulsen, N.E.; Laursen, G.V.; Rasmussen. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 51p. Contract ENS-1313/92-0003. Order Number DE95766523. Source: OSTI; NTIS.

EFP-92.

The Miocene beds of the Lille Toende borehole, southern Jylland (Denmark) was studied by means of dinoflagellate cysts, foraminifers, and molluscs. The biostratigraphy based on the three different fossil groups is compared, and correlations with northwest European and international standard chronostratigraphic units is attempted. This dates the northwest European 'Middle Miocene' as older than the standard Middle Miocene. Paleoecological interpretations (paleodepth, paleotemperature, paleosalinity) based on dinoflagellate cysts and foraminifers is described in details. The Arnum formation was found to have been deposit in an inner neritic environment, possibly with reduced salinity, and with subtropical sea temperatures, the winter surface temperatures was found to above 10 deg. C. The Hodde Formation and the Middle Miocene part of the Gram Formation was deposit under middle-outer neritic paleoenvironmental conditions and with fairly similar paleotemperatures. The Late Miocene part of the Gram Formation was deposit under outer neritic paleoenvironment conditions, but possibly under falling sea temperatures. Apparently, the sea level did in general rise until it reached a maximum near Tortonian-Messinian boundary. (au) (1 map, 84 refs.)

16734 (NEI-DK–1935) **Foraminiferal biostratigraphy of the post mid-Miocene in two boreholes in the Danish North Sea.** Konradi, P.B. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks

Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 22p. Contract ENS-1313/92-0003. Order Number DE95766524. Source: OSTI; NTIS.

EFP-92.

Cutting samples from two exploration wells, Cleo-1 and Kim-1, in the central Trough area in the northwestern part of the Danish North Sea, have been investigated for foraminiferal content in the section above the prominent mid-Miocene event. Benthonic foraminifera have been used to produce a stratigraphic subdivision by reference to the standard NSB zonation of King. The NSB 12 to NSB 17 zones (Middle Miocene to Middle Pleistocene) have been identified above the event. These zones can be related to the paleo water depth zonation. Paleoenvironmental reconstruction shows that sediments from the subject interval from Cleo-1 were deposited in a shallower situation than equivalent deposits in Kim-1. A conspicuous hiatus is identified in Cleo-1 at the Pliocene-Pleistocene boundary. (au) (12 refs.)

16735 (NEI-DK–1936) **Foraminiferal biostratigraphy of the post mid-Miocene in the Danish Central Trough, North Sea.** Konradi, P.B. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 21p. Contract ENS-1313/92-0003. Order Number DE95766525. Source: OSTI; NTIS.

EFP-92.

The foraminiferal content of ditch cutting samples from three exploration wells in the Danish North Sea has been investigated in the sections above the mid-Miocene marker. The wells are Cleo-1, situated at the edge of the Central Trough, Kim-1 and M-10 situated in the central part of the trough, in the northern and the southern part, respectively. Based on analysis of the benthic foraminiferal faunas, the strata in the boreholes are primarily subdivided in accordance with the standard North Sea zonation. The Kim-1 well only has a continous marine series, whereas the M-10 well and the Cleo-1 well displays hiatuses. The interpretations of the faunal assemblages indicate the oldest strata to be deposited in an open marine, outer shelf environment. Uphole through the wells, the content of planktic species diminishes gradually; the benthic assemblages indicate shallowing water depth reaching an inner shelf to littoral environment. This is interpreted to reflect the filling of the North Sea basin through the Middle to Late Miocene and Pliocene. The faunas in the Pleistocene deposits indicate an inner shelf to littoral environment, with periods of reduced salinity and non-marine sedimentation. (au) (14 refs.)

16736 (NEI-DK–1937) **Numerical biostratigraphy and depositional environments: benthic microfaunas in the Tertiary (Neogene) clastic sequence, Danish North Sea.** Stouge, S.; Laursen, G.V.; Konradi, P.B. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 157p. Contract ENS-1313/92-0003. Order Number DE95766526. Source: OSTI; NTIS.

EFP-92.

As part of the Tertiary project 'EFP-92' microfauna are used as palaeoenvironmental indicators for the Neogene of the Danish North Sea. Three wells, Cleo-1, Mona-1 and Kim-1, in the North Sea were sampled and investigated in detail for the microfauna content and treated using multivariate analysis methods. The constrained biostratigraphic analysis based on benthic foraminifera species recorded from the three wells provides a basis for a detailed zonation and a hierarchy of zones, subzones and faunas through the Neogene is obtained. Results of the biotope/biofacies analysis are that the fauna can be described as communities with a bathymetrical trend through time and the region is characterized by a change from bathyal environmental communities to shallow water communities. The occurrence and migrations of the biofacies from the Cleo-1 to Mona-1 to Kim-1 correspond with the results obtained from the seismic interpretation. Several biofacies of great importance in the Danish North Sea seem predimonantly to have their limit of distribution in terms of depth, although lateral segregation may be revealed in few cases. (au) (62 refs.)

16737 (Y/EN–4683) **Seismic hazard evaluation for Department of Energy Oak Ridge Reservations, Oak Ridge, Tennessee.** McGuire, R.K. (Risk Engineering, Inc., Golden, CO (United States)); Toro, G.F.; Hunt, R.J. Oak Ridge Y-12 Plant, TN (United States); Risk Engineering, Inc., Golden, CO (United States). 30 Sep 1992. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009053. Source: OSTI; NTIS; GPO Dep.

This study presents the results of an investigation of seismic hazard at the Department of Energy Oak Ridge Reservations (K-25 Site, Oak Ridge National Laboratories, and Oak Ridge Y-12 Plant), located in Oak Ridge, Tennessee. Oak Ridge is located in eastern Tennessee, in an area of moderate to high historical seismicity. Results from two separate seismic hazard analyses are presented. The EPRI/SOG analysis uses the input data and methodology developed by the Electric Power Research Institute, under the sponsorship of several electric utilities, for the evaluation of seismic hazard in the central and eastern United States. The LLNL analysis uses the input data and methodology developed by the Lawrence Livermore National Laboratory for the Nuclear Regulatory Commission. Both the EPRI/SOG and LLNL studies characterize earth-science uncertainty on the causes and characteristics of earthquakes in the central and eastern United States. This is accomplished by considering multiple hypotheses on the locations and parameters of seismic source zones and by considering multiple attenuation functions for the prediction of ground shaking given earthquake size and location. These hypotheses were generated by multiple expert teams and experts. Furthermore, each team and expert was asked to generate multiple hypotheses in order to characterize his own internal uncertainty. The seismic-hazard calculations are performed for all hypotheses. Combining the results from each hypothesis with the weight associated to that hypothesis, one obtains an overall representation of the seismic hazard at the Oak Ridge site and its uncertainty.

16738 (IC–94/393) **BFV quantization on hermitian symmetric spaces.** Fradkin, E.S.; Linetsky, V.Ya. International Centre for Theoretical Physics, Trieste (Italy). Dec 1994. 25p. Order Number DE95628161. Source: OSTI; NTIS (US Sales Only); INIS.

Gauge-invariant BFV approach to geometric quantization is applied to the case of hermitian symmetric spaces G/H. In particular, gauge invariant quantization on the Lobachevsky plane and sphere is carried out. Due to the presence of symmetry, master equations for the first-class constraints, quantum observables and physical quantum states are exactly solvable. BFV-BRST operator defines a flat G-connection in the Fock bundle over G/H. Physical states are covariantly constant sections with respect to this connection and are shown to coincide with the generalized coherent states for the group G. Vacuum expectation values of the quantum observables commuting with the quantum first-class constraints reduce to the covariant symbols of Berezin. The gauge-invariant approach to quantization on symplectic manifolds synthesizes geometric, deformation and Berezin quantization approaches. (author). 28 refs.

(International Centre for Theoretical Physics, Trieste (Italy)); Aliaga, J.; Cerdeira, H.A.; Proto, A.N. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 63p. Order Number DE95628162. Source: OSTI; NTIS (US Sales Only); INIS.

The dynamics and thermodynamics of a quantum time-dependent field coupled to a two-level system, well known as the Jaynes-Cummings Hamiltonian, is studied, using the maximum entropy principle. In the framework of this approach we found three different infinite sets of relevant operators that describe the dynamics of the system for any temporal dependence. These sets of relevant operators are connected by isomorphisms, which allow us to consider the case of mixed initial conditions. A consistent set of initial conditions is established using the maximum entropy principle density operator, obtaining restrictions to the physically feasible initial conditions of the system. The behaviour of the population inversion is shown for different time dependencies of the Hamiltonian

and initial conditions. For the time-independent case, an explicit solution for the population inversion in terms of the relevant operators of one of the sets is given. It is also shown how the well-known formulas for the population inversion are recovered for the special cases where the initial conditions correspond to a pure, coherent, and thermal field. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 15p. Order Number DE95628917. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper Squeezed and Covariance States based on Schroedinger inequality and their connection with other nonclassical states are considered for particular case of anisotropic waveguide in $LiNiO_3$. Here, the problem of photon creation and generation of squeezed and Schroedinger covariance states in optical waveguides is solved in two steps: 1. Quantization of electromagnetic field is provided in the presence of dielectric waveguide using normal-mode expansion. The photon creation and annihilation operators are introduced, expanding the solution A-vector(r-vector,t) in a series in terms of the Sturm - Liouville mode-functions. 2. In terms of these operators the Hamiltonian of the field in a nonlinear waveguide is derived. For such Hamiltonian we construct the covariance states as stable (with nonzero covariance), which minimize the Schroedinger uncertainty relation. The evolutions of the three second momenta of q-circumflex$_j$ and p-circumflex$_j$ are calculated. For this Hamiltonian all three momenta are expressed in terms of one real parameters s only. It is found out how covariance, via this parameter s, depends on the waveguide profile n(x,y), on the mode-distributions u-vector$_j$(x,y), and on the waveguide phase mismatching $\Delta\beta$. Submitted to Journal of Physics. A, Mathematical and General.

The radiation field of toroidal-like time-dependent current configurations is investigated. Time-dependent charge-current sources are found outside which the electromagnetic strengths disappear but the potentials survive. This can be used to carry out time-dependent Aharonov-Bohm-like experiments and the information transfer. Using the Neumann-Helmholtz parametrization of the current density we present the time-dependent electromagnetic field in a form convenient for applications. 17 refs.

The following well-known paradox is considered. On one hand, for each quantum system with a time-periodic Hamiltonian, solutions of the Schroedinger equation exist which are time-periodic functions modulated by the factor e^{-iEt}. On the other hand, the amplitude of a harmonic oscillator, acted upon by a time-periodic force with a resonant frequency, increases with time for any initial condition. The paradox is resolved with the help of the exact solution of the corresponding Schroedinger equation. It is shown that the paradox arises, if one does not take into account the transmutation of the quasienergy spectrum and of the steady states (quasienergy states) basis in a resonant point. 12 refs.

The question raised in the literature regarding the possibility of recognizing pure and mixed states in a beam of nonrelativistic particles is analyzed in terms of its density matrix. A specific theory of the phenomenon has been developed. In the general case, the beam occurs with a modulated density: from the kinematics standpoint, waves which resemble sound waves,are propagated along the beam.They have a discrete spectrum. The lower bound on the wavelength has a purely quantum origin and is determined by the coherence length which is many times larger than the De Broglie length under good beam monochromatization. In theory, the feasible and practical ways of realizing cold neutron beam transformation have been found which could extend the length and diminish the frequency of the corresponding modulation wave propagating in the beam. The immediate possibilities of the experiment are considered. 22 refs.

Submitted to American Journal of Physics.

An instructive analysis of the motion of the wave packet constructed of two bound states in two different potential wells is given. In contrast with the case of equivalent wells the packets don't go completely from one well to another (as is often erroneously stated, e.g. in 'Am.J.Phys.', 1992, 60, 88). Only a fraction of packets takes part in this inter-well tunneling and this fraction is the less the far from one another are the wells and the more is the difference between the wells. The phenomenon of the wave packet tunneling ('jumps') through the potential wells is discovered. 11 refs., 6 figs.

Submitted to Physical Review Letters.

Unexpectedly it turned out that when drawing together the levels of two bound states on an initial potential well these states 'disappear': corresponding wave functions are either carried away with auxiliary wells to infinity in both directions on the whole axis or pressed into the vertical potential walls (in the case of reference infinite rectangular well). All the functions of other levels in the remaining part of the well constitute a complete set. In the case of unsymmetrical potentials there can happen effective disappearance of one state of the doublet. 6 refs., 8 figs.

Computational physicists at Sandia National Laboratories have moved the Eulerian CTH code, and the arbitrary-Lagrangian-Eulerian ALEGRA code to distributed memory parallel computers. CTH is a three-dimensional solid mechanics code used for large-deformation, shock wave analysis. ALEGRA is a three-dimensional arbitrary Lagrangian-Eulerian solid-mechanics code used for coupled large-deformation, shock and structural mechanics problems. This paper discusses our experiences moving the codes to parallel computers, the algorithms we used and our experiences running the codes.

Gas targets play key roles in different fields of science and technology. The penetration of energetic charged particles into high pressure gas targets has been studied by several groups to optimize the radionuclide and neutron production using thin and thick gas targets, as well as in the field of investigation of charged particles and neutron induced nuclear reactions. To study the interaction of charged particles with gaseous material several experimental methods have been developed on the basis of measurement of the activity of the produced radioisotopes, secondary neutrons, heat, charge, emitted light, change of density, temperature, refractory indexes etc. The obtained results were mainly interpreted qualitatively using different phenomenological models. Only a few groups made systematic study of the interaction of charged particle beams and gas targets and still many questions remain open. This work was initiated by the optical study of gas targets made at Abo Akademi, Turku, Finland, and by the experimental results of excitation functions and production yields obtained in Debrecen, using gas targets at horizontal and vertical irradiation arrangement. The high speed video technique and charge distribution measurement allowed the study of both the transient effects of the beam penetration into gaseous targets, and the final equilibrium states of the beam in the targets at horizontal and vertical beam lines. An effort was made to explain the results phenomenologically.

16757 (BNL–61149, pp. 119-120) **Heat transport in targets and what it means to me.** Nickles, R.J. (Univ. of Wisconsin, Madison, WI (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). The author suggests, in colloquial fashion, that the temporal profile of the ion beam might be of interest in the study of heat transport from targets. He cites several personal examples.

16758 (BNL–61149, pp. 134-139) **Modeling of target thermal properties for the BLIP upgrade.** Mausner, L.F. (Brookhaven National Lab., Upton, NY (United States)); Hock, J.C.; Kolsky, K.L.; Tuozzolo, J.E. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The authors anticipate imminent approval to upgrade the Brookhaven Linac Isotope Producer (BLIP). This is an interim measure to improve availability of some accelerator produced radionuclides during the period while LAMPF operations phase out until the construction of the ambitious National Biomedical Tracer Facility (NBTF). The goals of this two year effort are to (1) increase the average proton beam current by a factor of 2.3 to a maximum of 145 μA at 200 MeV, (2) increase operations to 46 weeks per year with 90% beam availability (1.5d/month maintenance $\sim$ 5% + 5% downtime), and (3) undertake production of several radionuclides presently only available from LAMPF (ie. ^{88}Y, ^{109}Cd, ^{22}Na). The higher beam current will improve production yields, specific activity, throughput and cost efficiency. To reliably achieve this level of operation, modifications to the Linac are needed. The present limitations of the various Linac subsystems have been reviewed, and it is concluded that the best way to increase the average current is to make small improvements in several of the operating parameters, rather than trying to make a large increase in a single parameter. All changes are within the original machine design parameters. To begin this effort, the authors have attempted to theoretically model the heat transfer properties of three typical BLIP targets.

16759 (INP–1660/AP) **The adaptation of IFJ implantation facilities for the IBAD (Ion Beam Assisted Deposition) in the dual beam technique.** Drwiega, M. The progress in reconstruction of ion implantation facilities in the Institute of Nuclear Physics: new facilities for IBAD method and Dual Beam System are presented. 32 refs, 4 figs, 1 tab.

16760 Apparatus for supporting a cryogenic fluid containment system within an enclosure. Ganni, V.; Stifle, K.E.; Zhang, B.X. To Dept. of Energy. 1993. Filed date 4 Mar 1993. U.S. Patent Application 8-027,063. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95009977. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An apparatus for supporting at least one inner cryogenic fluid containment system within an outer isolating enclosure to retard heat transfer into the inner containment system comprising a plurality of supports serially interconnected and laterally spaced by lateral connections to extend the heat conduction path into the inner containment system.

16761 (UCRL-ID–118274) **EBIT: Electron Beam Ion Trap V-Division Experimental Physics annual report 1993.** Schneider, D. (ed.). Lawrence Livermore National Lab., CA (United States). Aug 1994. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010207. Source: OSTI; NTIS; GPO Dep.

This report discusses research being conducted using the electron beam ion trap. The areas of this research are: atomic structure measurements; diagnostics for fusion and astrophysics; ion/surface interaction studies; electron-ion interaction studies; electron, positron and ion collisions; and instrumental developments.

16762 (UCRL-JC–117182) **Studies of highly charged ions with EBIT and Super-EBIT.** Elliott, S.R. Lawrence Livermore National Lab., CA (United States). 14 Sep 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940922–5: 7. international conference on physics of highly charged ions, Vienna (Austria), 19-23 Sep 1994). Order Number DE95010251. Source: OSTI; NTIS; INIS; GPO Dep.

The LLNL electron beam ion traps provide cold highly charged ions up to bare U. These machines have provided a wealth of atomic physics data using a compact, relatively inexpensive, device. The physics program has studied electron-ion collisions, QED, ion-surface interactions, and plasmas physics among many other topics. The prospects for the study of the highest charge states in the highest Z ions led to the beam energy upgrade of the first EBIT into Super-EBIT. The desire to use ions as a research probe in themselves led to an ion extraction program on EBIT-2. Finally, a Penning trap (referred to as the RETRAP) has been constructed to catch extracted ions where they can be further cooled and studied. Results of several experiments at the LLNL EBIT facility are described. The program's capabilities are discussed.

16763 (DOE/ER/40481–T1) **Low energy solar neutrino experiments: The Soviet American Gallium Experiment (SAGE). Final report, August 12, 1988–October 31, 1994.** Louisiana State Univ., Baton Rouge, LA (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER40481. Order Number DE95010159. Source: OSTI; NTIS; INIS; GPO Dep.

Two ^{71}Ga experiments are currently in operation. The first is the 60 ton Soviet American Gallium Experiment (SAGE) at Baksan, which has recently reported a signal level of $73+18/-16(\text{stat})+5/-7(\text{syst})$ SNU; the second is the 30 ton GALLEX experiment at Gran Sasso, which sees $87\pm14\pm7$ SNU. Both results are consistent, and both suggest a neutrino flux level low compared to the total expected from standard solar model calculations. It is not possible, however, to make a case for flux levels lower than the p-p prediction. Assuming the experiments are correct (Neutrino source calibrations are planned for both SAGE and GALLEX in the near future.), it is not at all clear yet whether the answer lies with the neutrino physics, solar physics, or a combination of both. Nevertheless, though solar model effects cannot be ruled out, if the Homestake and Kamiokande results are taken at face value, then these two experiments alone imply that neutrino oscillations or some similar particle physics result must be present to some degree. This report reviews the SAGE experiment and recent results. Non-radiochemical experiments are also discussed, with an emphasis on the Kamiokande water Cerenkov results.

16764 (DOE/ET/53088–698) **On the quasihydrostatic flows of radiatively cooling self-gravitating gas clouds.** Meerson, B. (Hebrew Univ. of Jerusalem (Israel). Racah Institute of Physics); Megged, E.; Tajima, T. Texas Univ., Austin, TX (United States). Mar 1995. 39p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract FG05-80ET53088. Grant ATM 9113576. (IFSR–698). Order Number DE95009116. Source: OSTI; NTIS; INIS; GPO Dep.

Two model problems are considered, illustrating the dynamics of quasihydrostatic flows of radiatively cooling, optically thin self-gravitating gas clouds. In the first problem, spherically symmetric flows in an unmagnetized plasma are considered. For a power-law dependence of the radiative loss function on the temperature, a one-parameter family of self-similar solutions is found. The authors concentrate on a constant-mass cloud, one of the cases, when the self-similarity indices are uniquely selected. In this case, the self-similar flow problem can be formally reduced to the classical Lane-Emden equation and therefore solved analytically. The cloud is shown to undergo radiative condensation, if the gas specific heat ratio $\gamma > 4/3$. The condensation proceeds either gradually, or in the form of (quasihydrostatic) collapse. For $\gamma < 4/3$, the cloud is shown to expand. The second problem addresses a magnetized plasma slab that undergoes quasihydrostatic radiative cooling and condensation. The problem is solved analytically, employing the Lagrangian mass coordinate.

16765 (IC–94/234, pp. 6) **On the stability of proteinoid microspheres.** Mueller Herold, U. (Eidgenoessiche Technische Hochschule, Zurich (Switzerland). Lab. fuer Physikalische Chemie); Nickel, G. International Centre for Theoretical Physics, Trieste (Italy); Commission of the European Communities, Brussels (Belgium); International Centre for Genetic Engineering and Biotechnology, Trieste (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); International Science Foundation. Aug 1994. (CONF-9408232–: Conference on the structure and model of the first cell. The Alexander Ivanovich Oparin 100th Anniversary Conference, Trieste (Italy), 29 Aug - 2 sep 1994). In *Conference on the structure and model of the first cell. The Alexander Ivanovich Oparin 100th Anniversary Conference.* 28p. Order Number DE95627538. Source: OSTI; NTIS (US Sales Only); INIS.

Proteinoid Microspheres are stable hollow spheres in the range of 5 fm diameter. Their stability is discussed in terms of macroscopic energies. It is shown that the bulk and surface energy contributions alone cannot lead to stable microspheres. If electrostatic energy, due to transmembrane voltage, is taken into account, stable hollow spheres are proved to exist. For several reasons, however, this should not be regarded as the ultimate explanation of microsphere stability. (author). Abstract only.

16766 (IC–94/234, pp. 8) **Some aspects about laboratory cometary models.** Negron Mendoza, A. (Universidad Nacional Autonoma de Mexico, Mexico City (Mexico). Inst. de Ciencias Nucleares); Albarran, G.; Ramos, S.; Chacon, E. International Centre for Theoretical Physics, Trieste (Italy); Commission of the European Communities, Brussels (Belgium); International Centre for Genetic Engineering and Biotechnology, Trieste (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); International Science Foundation. Aug 1994. (CONF-9408232–: Conference on the structure and model of the first cell. The Alexander Ivanovich Oparin 100th Anniversary Conference, Trieste (Italy), 29 Aug - 2 sep 1994). In *Conference on the structure and model of the first cell. The Alexander Ivanovich Oparin 100th Anniversary Conference.* 28p. Order Number DE95627538. Source: OSTI; NTIS (US Sales Only); INIS.

During the past decades, astronomers have directed their attention toward the study of the solar system bodies, like comets, and they have made many discoveries. These studies have provided profound insights into the formation and earliest story of the solar system. A complementary role in the study of comets has been played by laboratory research on cometary models. In this paper, we discuss some aspects of laboratory experiments proposed in the literature, specially those associated with the chemical reactions that may occur in the comets. These comments are made the light of chemical composition, energy source, relevant chemical reactions and compounds detected in several laboratory simulations of cometary material. (author). Abstract only.

16767 (IC–94/234, pp. 19-22) **The origins of cellular chirality.** International Centre for Theoretical Physics, Trieste (Italy); Commission of the European Communities, Brussels (Belgium); International Centre for Genetic Engineering and Biotechnology, Trieste (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); International Science Foundation. Aug 1994. (CONF-9408232–: Conference on the structure and model of the first cell. The Alexander Ivanovich Oparin 100th Anniversary Conference, Trieste (Italy), 29 Aug - 2 sep 1994). One of the most striking properties of life is the fact that of the twenty indispensable protein amino acids, all (except glycine) are left-handed, that is, they rotate polarized light counterclockwise. In contrast, biologic sugars are all right-handed. Synthetic amino acids and sugars of nonbiological origin contain equal numbers of handed molecules. One cannot make spiral molecules of DNA out of synthetic, achiral amino acids and sugars. This paper speculates on the origins of cellular chirality in a unique geochemical setting for the precursors of life- the bubble columns in the surface environment of the World's oceans. 7 refs.

16768 (IC–95/28) **Structural transition models for a class or irreversible aggregates.** Canessa, E. International Centre for Theoretical Physics, Trieste (Italy). Feb 1995. 16p. Order Number DE95628183. Source: OSTI; NTIS (US Sales Only); INIS.

A progress report on two recent theoretical approaches proposed to understand the physics of irreversible fractal aggregates showing up a structural transition from a rather dense to a more multibranched growth is presented. In the first approach the transition is understood by solving the Poisson equation on a squared lattice. The second approach is based on the discretization of the Biharmonic equation. Within these models the transition appears when the growth velocity at the fractal surface presents a minimum. The effects of the surrounding medium and geometrical constraints for the seed particles are considered. By using the optical diffraction method, the structural transition is further characterized by a decrease in the fractal dimension for this peculiar class of aggregates. (author). 17 refs, 4 figs.

16769 (IC–95/32) **Propagation of EM waves in nonlinear magnetic and dielectric medias. Integrals of motion.** Nyamsuren, O. (International Centre for Theoretical Physics, Trieste (Italy)); Ochirbat, G. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 9p. Order Number DE95628184. Source: OSTI; NTIS (US Sales Only); INIS.

Scattering of electromagnetic wave on a nonlinear dielectric and magnetic film is considered. In both cases, the first integrals of motion having TE and TM field components are presented. For each type of polarization we show that Maxwell's equations can be solved exactly in quadratures for optically isotropic media with magnetic permeability which can be an arbitrary function of the local magnetic field intensity. Kerr and saturable media are considered. (author). 12 refs.

16770 (JINR-E–5-94-362) **On Helmholtz Problem for Plane Periodical Structures.** Akishin, P.G.; Vinitskij, S.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation; Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 11p. Order Number DE95627135. Source: OSTI; NTIS (US Sales Only); INIS.

The plane Helmholtz problem of the periodical disc structures with the phase shifts conditions of the solutions along the basis lattice vectors and the Dirichlet conditions on the basic boundaries is considered. The Green function satisfying the quasi periodical conditions on the lattice is constructed. The Helmholtz problem is reduced to the boundary integral equations for the simple layer potentials of this Green function. The methods of the discretization of the arising integral equations are proposed. The procedures of calculation of the matrix elements are discussed. The reality of the spectral parameter of the nonlinear continuous and discretized problems is shown. 8 refs., 2 figs.

16773 (LAMP–95/2) **Variation of the refractive index for the active layer of the double heterostructure GaAlAsSb/GaInAsSb/GaAlAsSb in injected mode.** LAMP series report (Laser, Atomic and Molecular Physics), LAMP series report (Laser, Atomic and Molecular Physics). Mohou, M.A. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 12p. Order Number DE95628929. Source: OSTI; NTIS (US Sales Only); INIS.

This work reports on the influence of the injected current on the refractive index in the active layer of GaInAsSb/GaAlAsSb laser diodes. These diodes present at threshold a full beam width at half power θ perpendicular of about 52 deg. C. The fluctuation of the refractive index caused by the injection of free carriers was studied on the basis of the evolution of θ perpendicular as a function of the injected current. It was shown that the inversion of the population which follows the rising of the gain, causes a slight decrease of the refractive index. 12 refs, 5 figs.

16774 (LA-UR–95-1082) **Low-density ionization behavior.** Baker, G.A. Jr. Los Alamos National Lab., NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9506170–1: Condensed matter theories, Caracas (Venezuela), 12-17 Jun 1995). Order Number DE95009495. Source: OSTI; NTIS; GPO Dep.

As part of a continuing study of the physics of matter under extreme conditions, I give some results on matter at extremely low density. In particular I compare a quantum mechanical calculation of the pressure for atomic hydrogen with the corresponding pressure given by Thomas-Fermi theory. (This calculation differs from the "confined atom" approximation in a physically significant way.) Since Thomas-Fermi theory in some sense, represents the case of infinite nuclear charge, these cases should represent extremes. Comparison is also made with Saha theory, which considers ionization from a chemical point of view, but is weak on excited-state effects. In this theory, the pressure undergoes rapid variation as electron ionization levels are passed. This effect is in contrast to the smooth behavior of the Thomas-Fermi fixed temperature, complete ionization occurs in the low density limit, I study the case where the temperature goes appropriately to zero with the density. Although considerable modification is required, Saha theory is closer to the actual results for this case than is Thomas-Fermi theory.

16775 (LA-UR–95-1097) **A collisionless shock wave experiment.** Winske, D.; Jones, M.E.; Sgro, A.G.; Thomas, V.A. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9504132–2: Spring workshop on basic science using pulsed power, Santa Barbara, CA (United States), 5-7 Apr 1995). Order Number DE95009489. Source: OSTI; NTIS; INIS; GPO Dep.

Collisionless shock waves are a very important heating mechanism for plasmas and are commonly found in space and astrophysical environments. Collisionless shocks were studied in the laboratory more than 20 years ago, and more recently in space via in situ satellite measurements. The authors propose a new laboratory shock wave experiment to address unresolved issues related to the differences in the partition of plasma heating between electrons and ions in space and laboratory plasmas, which can have important implications for a number of physical systems.

16776 (SAND–94-2324C) **Structural analyses of the JPL Mars Pathfinder impact.** Gwinn, K.W. (Sandia National Labs., Albuquerque, NM (United States). Material and Structural Mechanics Dept.). Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950582–1: 13. AIAA aerodynamic decelerator systems technology conference, Clearwater Beach, FL (United States), 15-19 May 1995). Order Number DE95009581. Source: OSTI; NTIS; GPO Dep.

The purpose of this paper is to demonstrate that finite element analysis can be used in the design process for high performance fabric structures. These structures exhibit extreme geometric nonlinearity; specifically, the contact and interaction of fabric surfaces with the large deformation which necessarily results from membrane structures introduces great complexity to analyses of this type. All of these features are demonstrated here in the analysis of the Jet Propulsion Laboratory (JPL) Mars Pathfinder impact onto Mars. This lander system uses airbags to envelope the lander experiment package, protecting it with large deformation upon contact. Results from the analysis show the stress in the fabric airbags, forces in the internal tendon support system, forces in the latches and hinges which allow the lander to deploy after impact, and deceleration of the lander components. All of these results provide the JPL engineers with design guidance for the success of this novel lander system.

16777 (UCRL-ID–118223) **Future scientific applications for high-energy lasers.** Lee, R.W. (comp.). Lawrence Livermore National Lab., CA (United States). 1 Aug 1994. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009380. Source: OSTI; NTIS; GPO Dep.

This report discusses future applications for high-energy lasers in the areas of astrophysics and space physics; hydrodynamics; material properties; plasma physics; radiation sources; and radiative properties.

16778 (UCRL-JC–118357) **Status of the large-scale dark-matter axion search.** Van Bibber, K. (Lawrence Livermore National Lab., CA (United States)); Hagmann, C.; Stoeffl, W.; Daw, E.; Rosenberg, L.; Sikivie, P.; Sullivan, N.; Tanner, D.; Moltz, D.; Tighe, R. Lawrence Livermore National Lab., CA (United States). Sep 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC03-76SF00098 ; AC02-76CH03000 ; FC02-94ER40818 ; FG05-86ER40272 ; FG02-90ER40560. (CONF-9402136–1: International conference on critique of the source of dark matter in the universe, Bel Air, CA (United States), 16-18 Feb 1994). Order Number DE95008828. Source: OSTI; NTIS; GPO Dep.

If axions constitute the dark matter of our galactic halo they can be detected by their conversion into monochromatic microwave photons in a high-Q microwave cavity permeated by a strong magnetic field. A large-scale experiment is under construction at LLNL to search for halo axions in the mass range 1.3 - 13 μeV, where axions may constitute closure density of the universe. The search builds upon two pilot efforts at BNL and the University of Florida in the late 1980's, and represents a large improvement in power sensitivity ($\sim$50) both due to the increase in magnetic volume (B^2V = 14 T^2m^3), and anticipated total noise temperature (T_n $\sim$3K). This search will also mark the first use of multiple power-combined cavities to extend the mass range accessible by this technique. Data will be analyzed in two parallel streams. In the first, the resolution of the power spectrum will be sufficient to resolve the expected width of the overall axion line, $\sim$◯ (1kHz). In the second, the resolution will be ◯(O.01-1 Hz) to look for extremely narrow substructure reflecting the primordial phase-space of the axions during infall. This experiment will be the first to have the required sensitivity to detect axions, for plausible axion models.

This working group report focuses on the physics potential of $\mu^+\mu^-$ colliders beyond what can be accomplished at linear e^+e^- colliders and the LHC. Particularly interesting possibilities include (1) s-channel resonance production to discover and study heavy Higgs bosons with ZZ and WW couplings that are suppressed or absent at tree-level (such as the H and A Higgs bosons of

supersymmetric models), (2) study of the strongly interacting electroweak sector, where higher energies give larger signals, and (3) measurements of the masses and properties of heavy supersymmetric particles.

16780 (DOE/ER/40633–3) **Annual report for the High Energy Physics Program at Texas A and M University, October 1, 1993–September 30, 1994.** Texas A and M Univ., College Station, TX (United States). Dept. of Physics. Oct 1994. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER40633. Order Number DE95010155. Source: OSTI; NTIS; INIS; GPO Dep.

The experimental and theoretical high energy physics programs at Texas A and M University have continued their ambitious research activities over the past year. On the experimental side, the authors have continued their participation in two major operating experiments, CDF and MACRO, and each of these programs have attained significant milestones during this period. Especially note worthy is the CDF Collaborations paper on the "evidence" for the top quark and MACRO's completion of the construction of the "Attico". In CDF, the Texas A and M group continues to play a leading role in the plans for upgrading the silicon vertex detector, as well as supporting the on going running of this experiment during its current data taking run. In addition, the group has focused its analysis efforts on studies of trilepton events and as well searching for supersymmetric particles. In MACRO, the authors have continued their work on the development of the final version of the wave form digitizing system. Within the past month the final production circuits have been assembled and they are currently testing these units at Texas A and M. The authors plan to complete this testing and commission the wave form digitizing system on the MACRO detector by the end of 1994. The theoretical high energy physics program has also continued to develop during the past funding cycle. D. Nanopoulos and colleagues have continued the study of their very successful string-derived model that unifies all known interactions; flipped SU(5), which is the leading candidate for a theory of everything. C. Pope has continued his work on generalizations of the symmetries of string theory, known as W algebras.

16782 (BNL–61547) **Applications of chiral symmetry.** Pisarski, R.D. Brookhaven National Lab., Upton, NY (United States). Mar 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9404253–1: Workshop on finite temperature QCD and Quark-Gluon transport theory, Wuhan (China), 18-21 Apr 1994). Order Number DE95009552. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses several topics in the applications of chiral symmetry at nonzero temperature. First, where does the rho go? The answer: up. The restoration of chiral symmetry at a temperature T_χ implies that the ρ and a_1 vector mesons are degenerate in mass. In a gauged linear sigma model the ρ mass increases with temperature, $m_\rho(T_\chi) > m_\rho(0)$. The author conjectures that at T_χ the thermal ρ - a_1, peak is relatively high, at about ~1 GeV, with a width approximately that at zero temperature (up to standard kinematic factors). The ω meson also increases in mass, nearly degenerate with the ρ, but its width grows dramatically with temperature, increasing to at least ~100 MeV by T_χ. The author also stresses how utterly remarkable the principle of vector meson dominance is, when viewed from the modern perspective of the renormalization group. Secondly, he discusses the possible appearance of disoriented chiral condensates from "quenched" heavy ion collisions. It appears difficult to obtain large domains of disoriented chiral condensates in the standard two flavor model. This leads to the last topic, which is the phase diagram for QCD with three flavors, and its proximity to the chiral critical point. QCD may be very near this chiral critical point, and one might thereby generated large domains of disoriented chiral condensates.

16783 (GSI–95-12(prepr.)) **Comment on the diagonalisation of Green functions.** Henning, P.A. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Inst. fuer Theoretische Physik). Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Feb 1995. 8p. Order Number DE95770050. Source: OSTI; NTIS (US Sales Only); INIS.

Real-time thermal field theory is known in the two flavors "closed-time path formalism" and "thermo field dynamics". With a certain choice of parameters the full two-point functions of these models are identical, hence a scheme to diagonalize the Green function in one model can be applied to the other as well. This allows to compare the diagonalization schemes that have been discussed in the recent literature in order to select the simplest one. Such comparison speaks in favor of a diagonalization method which is motivated from thermo field dynamics. (orig.)

16784 (IC–94/60) **Influence of supersymmetric particle pair emission by electron on evolution of neutron star.** Likhachev, G.G. (Moscow State Univ., Moscow (Russian Federation). Dept. of Theoretical Physics); Studenikin, A.I. International Centre for Theoretical Physics, Trieste (Italy). Apr 1994. 12p. Order Number DE95628208. Source: OSTI; NTIS (US Sales Only); INIS.

The processes of emission of a pair of supersymmetric particles (wino and sneutrino or selection and photino) by electron in strong magnetic field of neutron star are discussed. The contributions to the energy losses of the neutron star due to these processes are calculated. The comparison of these new proposed mechanisms of energy losses with the standard neutrino mechanism is presented. (author). 25 refs.

16785 (IC–94/390) **Non-abelian bosonization and higher spin symmetries.** Zaikov, R.P. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 25p. Order Number DE95628187. Source: OSTI; NTIS (US Sales Only); INIS.

The higher spin properties of the non-abelian bosonization in the classical theory are investigated. Both the symmetry transformation algebra and the classical current algebra for the non-abelian free fermionic model are linear Gel'fand-Dickey type algebras. However, for the corresponding WZNW model these algebras are different. There exist symmetry transformations which algebra remains the linear Gel'fand-Dickey algebra while in the corresponding current algebra nonlinear terms arised. Moreover, this algebra is closed (in Casimir form) only in an extended current space in which nonlinear currents are included. In the affine sector, it is necessary to include higher isotopic spin current too. As result we have have a triple extended algebra. (author). 30 refs.

16786 (IC–94/392) **Method of solving conformal models in D-dimensional space I.** Fradkin, E.S. (International Centre for Theoretical Physics, Trieste (Italy)); Palchik, M.Ya. International Centre for Theoretical Physics, Trieste (Italy). Dec 1994. 64p. Order Number DE95628933. Source: OSTI; NTIS (US Sales Only); INIS.

We study the Hilbert space of conformal field theory in D-dimensional space. The latter is shown to have model-independent structure. The states of matter fields and gauge fields form orthogonal subspaces. The dynamical principle fixing the choice of model may be formulated either in each of these subspaces, or in their direct sum. In the latter case, gauge interactions are necessarily present in the model. We formulate the conditions specifying the class of models where gauge interactions are being neglected. The anomalous Ward identities are derived. Different values of anomalous parameters (D-dimensional analogues of a central charge, including operator ones) correspond to different models. The structure of these models is analogous to that of 2-dimensional conformal theories. Each model is specified by D-dimensional analog of null vector. The exact solutions of the simplest models of this type are examined. It is shown that these models are equivalent to Lagrangian models of scalar fields with a triple interaction. The values of dimensions of such fields are calculated, and the closed sets of differential equations for higher Green functions are derived. (author). 25 refs.

16787 (IC–95/24) **Topology change and quantum physics.** Balachandran, A.P. (Syracuse Univ., NY (United States). Dept. of Physics); Bimonte, G.; Marmo, G.; Simoni, A. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 17p. (DSF-T–5/95; SU–4240-604.). Order Number DE95628932. Source: OSTI; NTIS (US Sales Only); INIS.

The role of topology in elementary quantum physics is discussed in detail. It is argued that attributes of classical spatial topology emerge from properties of state vectors with suitably smooth time evolution. Equivalently, they emerge from considerations on the domain of the quantum Hamiltonian, this domain being often specified by boundary conditions in elementary quantum physics. Several examples are presented where classical topology is changed by smoothly altering the boundary conditions. When the parameters labelling the latter are treated as quantum variables, quantum states need not give a well-defined classical topology, instead they can give a quantum superposition of such topologies. An existing argument of Sorkin based on the spin-statistics connection and indicating the necessity of topology change in quantum gravity is recalled. It is suggested therefrom and our results here that Einstein gravity and its minor variants are effective theories of a deeper description with additional novel degrees of freedom. Other reasons for suspecting such a microstructure are also summarized. (author). 22 refs, 3 figs.

16788 (IC–95/41) **An exact cosmological solution to string theory.** Jofre, O. (Instituto de Astronomia y Fisica del Espacio, Buenos Aires (Argentina)); Nunez, C. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 15p. Order Number DE95628934. Source: OSTI; NTIS (US Sales Only); INIS.

A homogeneous anisotropic four dimensional spacetime with Lorentzian signature is constructed from an ungauged WZW model based on a non-semisimple Lie group. The associated non-linear σ-model describes string propagation in an expanding-contracting universe with antisymmetric tensor and dilation backgrounds. The current algebra of SL(2,R) x R is constructed in terms of two free boson fields and two generalized parafermions, or four free bosons with background charge. This representation is used to study the string spectrum in the cosmological background. (author). 24 refs.

16789 (IHEP–93-126) **New series of 3 D lattice integrable models.** Mangazeev, V.V.; Sergeev, S.M.; Stroganov, Yu.G. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 17p. Order Number DE95628935. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper we present a new series of 3-dimensional integrable lattice models with N colors. The weight functions of the models satisfy modified tetrahedron equations with N states and give a commuting family of two-layer transfer-matrices. The dependence on the spectral parameters corresponds to the static limit of the modified tetrahedron equations and weights are parameterized in terms of elliptic functions. The models contain two free parameters: elliptic modulus and additional parameter η. 12 refs.

16790 (INS–1087) **Quantum and classical aspects of deformed c = 1 strings.** Nakatsu, T.; Tsujimaru, S.; Takasaki, K. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jan 1995. 53p. Order Number DE95767950. Source: OSTI; NTIS; INIS.

The quantum and classical aspects of a deformed c=1 matrix model proposed by Jevicki and Yoneya are studied. String equations are formulated in the framework of the Toda lattice hierarchy. The Whittaker functions now play the role of generalized Airy functions in $c<1$ strings. This matrix model has two distinct parameters. Identification of the string coupling constant is thereby not unique, and leads to several different perturbative interpretations of this model as a string theory. Two such possible interpretations are examined. In both cases, the classical limit of the string equations, which turns out to give a formal solution of Polchinski's scattering equations, shows that the classical scattering amplitudes of massless tachyons are insensitive to deformations of the parameters in the matrix model. (author).

16791 (JINR-E–2-94-377) **From Antibracket to Equivariant Characteristic Classes.** Nersesyan, A.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 6p. Order Number DE95627183. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters. B.

We construct the odd symplectic structure and the equivariant even (pre)symplectic one from it on the space of differential forms on the Riemann manifold. The Poincare-Cartan like invariants of the second structure define the equivariant generalizations of Euler classes on the surfaces. 14 refs.

16792 (JINR-E–2-94-388) **The Background-Field Method and Noninvariant Renormalization.** Avdeev, L.V.; Kazakov, D.I.; Kalmykov, M.Yu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 16p. Order Number DE95627147. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters. B.

We investigate the consistency of the background-field formalism when applying various regularizations and renormalization schemes. By an example of a two-dimensional σ model it is demonstrated that the background-field method gives incorrect results when the regularization (and/or renormalization) is noninvariant. In particular, it is found that the cut-off regularization and the differential renormalization belong to this class and are incompatible with the background-field method in theories with nonlinear symmetries. 17 refs.

16793 (JINR-E–2-94-410) **On q-Deformed Spinning Relativistic Particle.** Malik, R.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 11p. Order Number DE95628188. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters. B.

A q-deformed free spinning relativistic particle is discussed in the framework of the Lagrangian formalism. Three equivalent Lagrangians are obtained for this system which are endowed with q-deformed local (super)gauge symmetries and reparametrization invariance. It is demonstrated that these symmetries are on-shell equivalent only for $q=\pm1$ under particular identification of the transformation parameters. The same condition ($q=\pm1$) emerges due to the requirement that the q-commutator of two supersymmetric gauge transformation. For a specific gauge choice, the solutions for equations of motion respect $GL_{\sqrt{q}}(1|1)$ and $GL_q(2)$ invariances for any arbitrary value of the evolution parameter characterizing the quantum super world-line. 15 refs.

16794 (JINR-E–2-94-443) **Some New Integrable Equations from the Self-Dual Yang-Mills Equations.** Ivanova, T.A.; Popov, A.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 16p. Order Number DE95628209. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters. A.

Using the symmetry reductions of the self-dual Yang-Mills (SDYM) equations in (2+2) dimensions, we introduce new integrable equations which are 'deformations' of the chiral model in (2+1) dimensions, generalized nonlinear Schroedinger, Korteweg-de Vries, Toda lattice, Garnier, Euler-Arnold, generalized Calogero-Moser and Euler-Calogero-Moser equations. The Lax pairs for all of these equations are derived by the symmetry reductions of the Lax pair for the SDYM equations. 34 refs.

16795 (JINR-E-2-94-444) **Classical Dynamics of Rotating Relativistic String with Massive Ends: the Regge Trajectories and Quark Masses.** Barbashov, B.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 14p. Order Number DE95628189. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Physics. B.

Dynamic equations in the theory of a relativistic string with point masses at the ends are formulated in terms of geometric invariants of the world trajectories of the massive ends of the string (curvature k_i and torsion $\kappa_i(\tau)$, i=1,2 of the trajectories). With these characteristics we reproduce the string world surface up to its position in Minkowski space E_2^1. The torsions $\kappa_i(\tau)$, i=1,2 obey a system of second order differential equations with delay arguments describing the retardation effects of the interaction of masses through the string, k_i being constants. The constant torsions are investigated in detail. In this case the string world sheet is a helicoid in E_2^1. A nonlinear relation (the Regge trajectory) between the angular momentum of the system, J and the mass squared, M^2, is derived. For given meson masses (M) and spin (J), the masses of quarks are calculated. 14 refs., 1 fig., 1 tab.

16796 (JINR-E-2-94-449) **Solution of Self-Duality Equation in Quantum-Group Gauge Theory and Quantum Harmonics.** Zupnik, B.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 10p. Order Number DE95628210. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters. B.

We discuss the gauge theory for quantum group $SU_q(2)xU(1)$ on the quantum Euclidean space. This theory contains three physical gauge fields and one U(1)-gauge fields with a zero field strength. We construct the quantum-group self-duality equation (QGSDE) in terms of differential forms and with the help of field-strength decomposition. A deformed analog of the BPST-instanton solution is obtained. We consider a harmonic (Twistor) interpretation of QGSDE in terms of $SU_q(2)/U(1)$ quantum harmonics. The quantum harmonic gauge equations are formulated in the framework of a left- covariant 3D differential calculus on the quantum group $SU_q(2)$. 19 refs.

16797 (JINR-E-2-94-462) **On One-Loop Renormalization of Black-Hole Entropy.** Fursaev, D.V.; Solodukhin, S.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 15p. Order Number DE95628190. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physical Review. Letters.

One-loop divergences appearing in the entropy of a quantum black hole are proven to be completely eliminated by the standard renormalization of both the gravitational constant and other coefficients by the R^2-terms in the effective gravitational action. The essential point of the proof is that due to the higher order curvature terms the entropy differs from the Bekenstein-Hawking one in the Einstein gravity by the contributions depending on the internal and external geometry of the horizon surface. 15 refs.

I discuss different models which predict changes in the mass of the thermal ρ field. I emphasize that while the predictions are strongly model dependent, nevertheless substantial shifts in the thermal ρ mass are expected to occur at the point of phase transition. As long as the thermal ρ peak does not become too broad, this should provide a striking signature of the existence of a phase transition.

Source: OSTI; NTIS; INIS; GPO Dep.

The electroweak Standard Model is summarized at the classical and quantum levels, including its gauge symmetry and symmetry-breaking aspects. The full implications of precise measurements of electroweak gauge forces are presented in terms of electroweak parameters and quantum corrections. The minimal Standard Model (SM) (including the top quark) satisfies the data well, up to one-loop accuracy. Possible non-Standard states subject to electroweak forces in quantum corrections is highly restricted by the present data. The status of exact and approximate symmetries of the electroweak Standard Model is summarized.

16811 (IC–94/226) **On the possibility on constructing covariant chromomagnetic field models.** Cabo, A. (International Centre for Theoretical Physics, Trieste (Italy)); Penaranda, S.; Martinez, R. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 13p. Order Number DE95628225. Source: OSTI; NTIS (US Sales Only); INIS.

Expressions for SO(4) invariant euclidean QCD generating functionals are introduced which should produce non-vanishing gluon condensates. Their investigation is started here by initially considering the loop expansion of the corresponding effective action searching for a description differing from the usual perturbation theory. At this level, we consider special free propagators showing a sort or off-diagonal long range order. The calculation of the polarization tensor leads to a gluon mass term which is proportional to the squared root of the also finite value for $<G^2>$. The summation of all the one-loop contributions to the energy having only mass insertions, indicates the spontaneous generation of the condensate from the perturbative grounds state in a way resembling the similar effect in the case of the chromomagnetic field models. This initial inspection suggests the need for a closer investigation which will be considered elsewhere. (author). 22 refs.

16812 (IC–95/29) **Axino mass in supergravity models.** Chun, E.J. (International Centre for Theoretical Physics, Trieste (Italy)); Lukas, A. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 11p. Contract SC1-CT91-0729. (TUM-HEP–215/95; HEP-PH–9503233). Order Number DE95628214. Source: OSTI; NTIS (US Sales Only); INIS.

We analyze the mass of the axino, the fermionic superpartner of the axion, in general supergravity models incorporating a Peccei Quinn symmetry and determine the cosmological constraints on this mass. In particular, we derive a simple criterion to identify models with an LSP axino which has a mass of $O(m^2_{3/2}/f_{PQ}) = O(keV)$ and can serve as a candidate for (warm) dark matter. We point out that such models have very special properties and in addition, the small axino mass has to be protected against radiative corrections by demanding small couplings in the Peccei Quinn sector. Generically, we find an axino mass of order $m_{3/2}$. Such masses are constrained by the requirement of an axino decay which occurs before the decoupling of the ordinary LSP. Especially, for a large Peccei Quinn scale $f_{PQ} > 10^{11}$ GeV this constraint might be difficult to fulfill. (author). 16 refs.

16813 (INP–1666/PH) **Gluons from logarithmic slopes of F_2 in the NLL approximation.** Golec-Biernat, K. (Institute of Nuclear Physics, Cracow (Poland)). Institute of Nuclear Physics, Cracow (Poland). Feb 1994. 9p. Grant KBN 20198 91 01. Order Number DE95628957. Source: OSTI; NTIS; INIS.

We make a critical, next-to-leading order, study of the accuracy of the "Prytz" relation, which is frequently used to extract the gluon distribution at small x from the logarithmic slopes of the structure function F_2. We find that the simple relation is not generally valid in the HERA regime, but show that it is a reasonable approximation for gluons which are sufficiency singular at small x. (author). 9 refs, 3 figs.

16814 (INP–1667/PH) **Quark matter inside neutron stars in an effective chiral model.** Kotlorz, A. (Institute of Nuclear Physics, Cracow (Poland)); Kutschera, M. Institute of Nuclear Physics, Cracow (Poland). Feb 1994. 20p. Grant KBN 20204 91 01; Grant KBN 20054 91 01. Order Number DE95628954. Source: OSTI; NTIS; INIS.

An effective chiral model which describes properties of a single baryon predicts that the quark matter relevant to neutron stars, close to the deconfinement density, is in a chirally broken phase.

We find the SU(2) model that pion-condensed up and down quark matter is preferred energetically at neutron star densities. It exhibits spin ordering and can posses a permanent magnetization. The equation of state of quark matter with chiral condensate is very well approximated by bag model equation of the state with suitably chosen parameters. We study quark cores inside neutron stars in this model using realistic nucleon equations of state. The biggest quark core corresponds to the second order phase transition to quark matter. Magnetic moment of the pion-condensed quark core is calculated. (author). 19 refs, 10 refs, 1 tab.

Talk at the Workshop on Chiral Perturbation Theory, Bratislava, Sep 5-10, 1994.

In this work we present a strong chiral meson Lagrangian up to and including $O(p^6)$ in the momentum expansion. It is derived from the Nambu-Jona-Lasinio (NJL) model using the heat-kernel method. Identities related to the properties of covariant derivatives of the chiral matrix U as well as field transformations have been used to predict the chiral coefficients of a minimal set of linearly independent terms. 16 refs.

Talk at the Workshop on Chiral Perturbation Theory, Bratislava, Sep 5-10, 1994.

Starting from an effective NJL-type quark interaction we have derived an effective meson action for the pseudoscalar sector. The vector and axial-vector degrees of freedom have been integrated out, applying the static equations of motion. As the results we have found a (reduced) pseudoscalar meson Lagrangian of the Gasser-Leutwyler type with modified structure coefficients L_i. This method has been also used to construct the reduced weak and electromagnetic-weak currents. The application of the reduced Lagrangian and currents has been considered in physical processes. 36 refs., 1 fig., 1 tab.

Lab. of Theoretical Physics. 1994. 10p. Order Number DE95627187. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters. Section B.

The one-loop radiative corrections to the Higgs boson potential in the MSSM, originating from the top quark loops, are summed in the leading log approximation using the renormalization group. The RG improved effective potential is minimized and the corrections to the CP-odd and CP-even Higgs boson masses are calculated. The resulting masses exhibit smoother top mass dependence than those calculated without RG summation. We have also found that for preferable values of the top mass the light Higgs mass does not exceed 100 GeV. 10 refs., 1 fig.

16818 (JINR-E–2-94-413) **Gluon Contribution to the Transverse Spin Structure Function g_2.** Belitskij, A.V.; Efremov, A.V.; Teryaev, O.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 10p. Order Number DE95628226. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yadernaya Fizika.

We consider the twist-3 gluon contribution to the transverse spin structure function g_2. We find that the Burkhardt-Cottingham sum rule is satisfied. The additional nonlocal operators appear in the moments of g_2 which absent in previous analysis of Bukhvostov, Kuraev and Lipatov. 10 refs.

Submitted to Yadernaya Fizika.

In one loop approximation the analytical expression of the axial-vector triangle graph containing anomaly was obtained in a most general case of arbitrary virtualities of external momenta. The t'Hooft consistency principle is applied to the QCD sum rules for the first moment of the photon spin structure function. It is shown that the contribution of the singlet axial current to the sum rules g_1 appears to be zero. 19 refs., 1 fig.

Submitted to Yadernaya Fizika.

Within QCD-motivated potential model, the masses and decay constants of pseudoscalar mesons are calculated. The model is based on the effective QCD Hamiltonian in Coulomb's gauge, which forbids color states. The description of mesons in this model is realized with the use of Schwinger-Dyson and Bethe-Salpeter equations with certain phenomenological choice of the potential and renormalization method. Solutions of these equations are obtained in the hadronic oscillators potential approximation with the use of different methods of Schwinger-Dyson equation renormalization. It is shown, that the use of special modification of this renormalization, satisfying physical boundary conditions, allows us to describe the mass spectrum and decay constant of mesons and their radial excited states. (author). 9 refs., 15 figs., 3 tabs.

A complete tree-level Standard Model calculation of the reaction $e^+e^- \rightarrow$ b anti b + 2 jets in the energy range of LEPII and the Next e^+e^- Linear Collider is presented. The 2-jet system represents either a q anti q pair or two gluons. The matrix elements were calculated by means of the package CompHEP, and phase space integration and event generation were carried out with the computer programs BASES/SPRING. Cross sections of the Higgs boson, the total background and important subsets of background are studied as functions of the c.m.s. energy and the Higgs mass, taking into account possible interferences. Various event distributions calculated for realistic integrated luminosities indicate encouraging prospects regarding the extraction of the Higgs signal. (orig.)

The activities during the first nine months of the three-year grant period have concentrated on the development of computer resources both hardware and software as well as the design of a muon detector for Fermilab Experiment E831. An important related activity has been a successful search of funds to complement the resources provided by this grant and permit the involvement of additional personnel as well as a much-better leveraged impact of the funds provided. Grant funds were the main providers of a new computer system which is dedicated to the High Energy Physics group at Mayaguez. This system can be considered a minimum configuration to carry out the simulation and analysis loads of E831. The bulk of the software development has been directed at developing a Monte Carlo simulation for E831 in particular the E831 muon detector.

Order Number DE95007207. Source: OSTI; NTIS; INIS; GPO Dep.

We present differences in leading and non-leading charged D meson production as a doubly-differential function of both P^2_t and $x\int$. Comparisons to specific models are made. This information is from the analysis of half the data from Fermilab experiment E791, taken during the 1991-2 fixed target run with a 500 GeV/c π^- beam incident on a segmented target.

16826 (FNAL/C–95/041) **Charm photoproduction dynamics.** Garbincius, P.H. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950285–1: LAFEX international school in high energy physics, Rio de Janeiro (Brazil), 20 Feb 1995). Order Number DE95009106. Source: OSTI; NTIS; INIS; GPO Dep.

Photoproduction of open charm is reviewed, both as a tool for studying the properties of charm particles such as spectroscopy, decays, and lifetimes, and as a testing ground for theoretical calculations of production dynamics. Many characteristics of charm photoproduction are described in terms of the leading order (LO) $\alpha_{EM}\alpha_S$ Photon-Gluon Fusion (PGF) model. The next-to-leading order (NLO) corrections of strength $\alpha_{EM}\alpha_S^2$ due to radiation of additional gluons are then added. The sensitivities of the NLO calculations on the mass of the charm quark, m_c, and on the choice of the gluon structure function of the nucleon are illustrated for the energy dependence of the cross section for charm photoproduction. These are compared with fixed target data and new HERA data. The single charm particle inclusive distributions in x_f and $p_\perp^2$, along with $\sigma(\gamma N \rightarrow c\bar{c}X)$ give good estimates of m_c and n_g, the shape parameter for the gluon distribution within the nucleon. As in hadroproduction, some disagreements between prediction and observation begin to appear in trying to simultaneously match the distributions in both $p_\perp^2$ for single charm particles and in the $\Delta\Phi$ acoplanarity angle between pairs of charm particles. These can be partially remedied by modifying the fragmentation function for c-quarks into charm particles, and by including extra $k_\perp^2$ transverse smearing of the gluon distributions within the target nucleon. Initial studies of the relative production between charm particles and anti-particles indicate disagreement with the predictions of the independent string fragmentation model.

16827 (GSI–95-14(prepr.)) **Empirical regularities in the χ-dependence of nuclear J/Ψsuppression.** Gerschel, C. (Institut de Physique Nucleaire, Orsay (France)); Huefner, J.; Quack, E. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Feb 1995. 11p. Order Number DE95770049. Source: OSTI; NTIS (US Sales Only); INIS.

The measured ratios $R(x, A_1/A_2)$ for J/Ψ, Ψ' and $\mu^+\mu^-$ production on two different targets A_1, A_2 as a function of the fractional momentum x of the final state are well fit with a very simple functional form having three adjustable parameters. An empirical relation is found between the three parameters of the fit. The deduced J/Ψ absorption cross sections σ_{abs} cluster around two values of which only σ_{abs}=5.8±0.2 mb seems acceptable. (orig.)

The presence of the (B + L)-conserving decay modes $n \rightarrow K^+e^-$, $n \rightarrow K^+\mu^-$, $p \rightarrow K^+e^-\pi^+$ and $p \rightarrow K^+\mu^-\pi^+$ is shown to be a characteristic feature of a class of models with explicit breaking of R-parity. These modes dominate over the (B - L)-conserving ones in certain regions of the parameter space; the impact of this scenarios for nucleon decay search at the Super-Kamiokande is discussed. (author). 10 refs.

16833 (INP–1646/PH) **Multiple photon emission in heavy particle decays.** Asakimori, K. (Kobe Women's Junior College, Kobe (Japan)); Burnett, T.H.; Cherry, M.L. JACEE. Institute of Nuclear Physics, Cracow (Poland). Mar 1994. 19p. Grant KBN 20341 91 01. Order Number DE95628961. Source: OSTI; NTIS; INIS.

Cosmic ray interactions, at energies above 1 TeV/nucleon, in emulsion chambers flown on high altitude balloons have yielded two events showing apparent decays of a heavy particle into one charged particle and four photons. The photons converted into electron pairs very close to the decay vertex. Attempts to explain this decay topology with known particle decays are presented. Unless both events represent a b → u transition, which is statistically unlikely, then other known decay modes for charmed or bottom particles do not account satisfactorily for these observations. This could indicate, possibly, a new decay channel. (author). 7 refs, 6 figs, 2 tabs.

Submitted to Pis'ma v Zhurnal Ehksperimental'noj i Teoreticheskoj Fiziki.

Within the relativistic quark model with confined light quarks we calculate the widths of radiative and hadronic decays of vector heavy mesons. They depend on the constituent masses of heavy quarks (M_c and M_b) which are the only adjustable parameters in our approach. Using the available experimental data from CLEO- and ARGUS-collaboration for the $D^* \to D\gamma$ and $D^* \to D\pi$ branching ratios, we find the allowed interval for the charm quark mass: 1,28 GeV < M_c < 1.66 GeV and give the predictions for the absolute values of decay widths. Also we consider the heavy quark limit $M_Q \to \infty$ with $E = M_H - M_Q$ being fixed for the decay amplitudes. 17 refs., 11 figs., 4 tabs.

Submitted to Nuclear Physics. A.

The observation with high resolution Ge-detectors of the 1229 keV and 2171 keV gamma-rays emitted in the ^{28} Si(μ, ν)^{28} Al(1$^+$, 2202 keV) reaction allowed us to determine the nuclear-amplitude ratio x≡ M(2)/M(-1) characteristic of this muon-capture reaction. Using the nuclear-structure dependent evaluation of various correction terms (model of s.Ciechanowicz), our result x = +0.254 ± 0.034 provides for the induced pseudoscalar coupling g_P the ratio $g_P/g_A(0{,}848\ m_\mu{}^2) = 3.4 \pm 1.0$, to be compared to the PCAC-prediction of $g_P/g_A = 7$. The model-dependence of this apparent quenching remains to be open. 59 refs., 5 figs., 5 tabs.

This thesis presents studies of the strong and electroweak forces, two of the fundamental interactions that govern the behavior of matter at high energies. The authors have used the hadronic decays of Z^0 bosons produced with the unique experimental apparatus of the e^+e^- Linear Collider at the Stanford Linear Accelerator Center (SLAC) and the SLAC Large Detector (SLD) for these measurements. Employing the precision tracking capabilities of the SLD, they isolated samples of Z^0 events containing primarily the decays of the Z^0 to a chosen quark type. With an inclusive selection technique, they have tested the flavor independence of the strong coupling, α_s by measuring the rates of multi-jet production in isolated samples of light (uds), c, and b quark events. They find: ${\alpha_s}^{uds}/{\alpha_s}^{all}$ 0.987 ± 0.027(stat) ± 0.022(syst) ± 0.022(theory), ${\alpha_s}^c/{\alpha_s}^{all}$ = 1.012 ± 0.104(stat) ± 0.102(syst) ± 0.096(theory), ${\alpha_s}^b/{\alpha_s}^{all}$ = 1.026 ± 0.041(stat) ± 0.030(theory), which implies that the strong interaction is independent of quark flavor within the present experimental sensitivity. They have also measured the extent of parity-violation in the Z^0 $c\bar{c}$ coupling, given by the parameter ${A_c}^0$, using a sample of fully and partially reconstructed D^* and D^+ meson decays and the longitudinal polarization of the SLC electron beam. This sample of charm quark events was derived with selection techniques based on their kinematic properties and decay topologies. They find ${A_c}^0$ = 0.73 ± 0.22(stat) ± 0.10(syst). This value is consistent with that expected in the electroweak standard model of particle interactions.

16843 (SLAC-R–95-459) **A search for jet handedness in hadronic Z^0 decays.** Hasegawa, Yoji. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1995. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (TOHOKU-HEP–95-02; TOHOKU-HEP-NOTE–95-0). Order Number DE95010099. Source: OSTI; NTIS; INIS; GPO Dep.

Transport of polarization through hadronization process is one of the fundamental interest in Quantum Chromodynamics which is a theory of strong interactions. In the low energy region where the hadronization occurs, QCD calculations are difficult, therefore at present the transport can be investigated experimentally. In this study the authors have searched for signatures of polarization of quarks and antiquarks in hadronic jets from $Z^0 \rightarrow q\bar{q}$ decays. The polarization of quarks and antiquark produced by Z^0 decays are predicted by the Standard Model of elementary particle physics. The authors defined several quantities depending on "jet handedness" methods and studied the correlation between the predicted polarization and the quantities. The signal was estimated by analyzing power which represents degree of the polarization transport through the hadronization process. The Z^0 decays were measured by SLC Large Detector and the polarized electron beam provided by SLAC Linear Collider was useful for this study. The data from the 1993 run showed no signature of the transport of quark and antiquark polarization. Upper limits on magnitude of the analyzing power were set in the range 0.05-0.15 depending on the methods.

The spin alignment of a $\rho^0(770)$ meson has been investigated in p-bar p interactions at 32 GeV/c. The statistics of 250 K p-bar p collisions was obtained with the help of the liquid hydrogen bubble chamber 'Mirabelle'. Various reference frames have been used in the analysis and the most profound effect has been revealed in the transversity frame. The measured value of the spin density matrix element ρ_{00} amounts to 0.447 ± 0.033. 25 refs., 6 figs., 3 tabs.

New results of the proton structure function F_2 are obtained from 543 nb^{-1} of data collected with ZEUS at HERA. The measurement extends over a wide kinematic region from 8.5 GeV^2 to 6280 GeV^2 in Q^2 and from 2.3×10^{-4} to 0.24 in x. The results consistently improves the previous F_2 results by ZEUS and H1, with the smaller errors, the finer binning and the extension of the kinematic range. In the small x region, F_2 increases steeply along with the decrease of x. However, F_2 shows slightly faster Q^2-evolution than available predictions at small x. The increase of F_2 at small x is compatible with the gluon distribution parametrized as $xg(x)\text{-}x^{-\lambda}$ with a value of λ between 0.3 and 0.5. (author) 61 refs.

16850 (JINR-E–1-94-387) **Highly Excited Matter Probed with Strangeness in Nucleus-Nucleus Collisions at JINR.** Okonov, Eh.O. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 4p. Order Number DE95627233. Source: OSTI; NTIS (US Sales Only); INIS.

The talk given at the International Conference 'Nucleus-Nucleus Collisions 5', Taormina, Italy, 30 May-4 Jun 1994.

Studies of characteristics of Λ and K^0 particles, produced in central collisions of nuclei from the synchrophasotron (E = 3.3 -3.7 A GeV) have revealed effects predicted as signals of the hadronic matter thermalization, compression and heating up to Boltzmann temperatures $T_B \simeq 160$ MeV ($T_0 \simeq 210$ MeV) with approaching the plateau which is then seen throughout more recent AGS/SPS results, up to E=200 A GeV. An increase of the relative Λ yield in mid rapidities has been observed as well which is also an evidence for a formation of the strangeness abundant mixed phase. The obtained data demonstrate that the strangeness is an efficient probe of the highly excited/compressed matter, i.e. in the baryon-rich regime, which requires (according to many model predictions) for the phase transition into Quark Gluon Plasma, rather low energies (2-5 A GeV) and would provide favourable signal/background ratios. This advantage is expected to be more pronounced in Nuclotron experiments at 5-6 A GeV which aim to examine the observed effects with heavier nuclei and to study other QGP signals including near-threshold production of anti Λ, Ξ, Ω, ϕ, H particles. The planned experiments could simulate more adequately some astrophysical processes and provide information not only about the deconfinement but about another phenomenon which also is predicted to provoke a QGP formation, namely the chiral symmetry restoration with its expected high density/low temperature effects. 12 refs., 1 fig., 1 tab.

16851 (JINR-E–2-94-404) **Longitudinal Structure Function F_L as Function of F_2 and $dF_2/d\ln Q^2$ at Small x.** Kotikov, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 7p. Order Number DE95627231. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Pis'ma v Zhurnal Ehksperimental'noj i Teoreticheskoj Fiziki.

A formula is presented to extract the longitudinal deep inelastic structure function F_L from transverse structure function F^2 and its derivative $dF_2/d\ln Q^2$ at small x in the leading order of perturbation theory. The detailed analysis is given for new data of H1 group from HERA. The values of F_L and DIS structure function ratio R are found at $10^{-3} \leq x \leq 2 \cdot 10^{-2}$ and $Q^2 = 20$ GeV^2. 16 refs., 2 figs.

This volume of the RCNP annual report gives briefly research activities of the RCNP (Research Center for Nuclear Physics), Osaka University, in the academic year of 1993 (April 1993 - March 1994). RCNP is a national nuclear physics laboratory with the AVF cyclotron and the ring cyclotron. This annual report includes major research activities at RCNP as follows. (1) Low-energy nuclear physics by means of the K=140 MeV AVF cyclotron. Nuclear reactions and nuclear structures were studied. (2) Medium-energy nuclear physics by means of the 0.4 GeV ring cyclotron. The new ring cyclotron is in full operation, and several new progresses in the medium energy nuclear physics have been made. In particular, spin-isospin responses for discrete states, giant resonances and for quasi-free scattering processes have been studied by means of charge exchange reactions. (3) Heavy-ion physics with the secondary radio-active nuclear beams. It includes production of radioactive nuclei with large spin-polarization and studies of snowballs. (4) Non-accelerator physics programs have started in collaboration with the Dept. Phys. group. Neutrino studies by means of double beta decays and dark matter searches by means of scintillators are under progress at the Kamioka underground laboratory. (5) Theoretical works on nuclear structures and nuclear reactions. The RCNP computers are widely used for theoretical studies all over Japan. (6) Developments of accelerators and detector systems. The new external ion-source and the new axial injection line are build in order to increase beam currents. (J.P.N.).

16856 (CEA-CONF–11698) **Exotic nuclear shapes - axial and nonaxial octupoles at normal and at super-deformation.** Skalski, J. (Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland)); Heenen, P.H.; Flocard, H.; Meyer, J.; Bonche, P. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique. 1992. 12p. (CONF-9205108–: International conference on nuclear structure at high angular momentum, Ottawa (Canada), 18-21 May 1992). Order Number DE95628980. Source: OSTI; NTIS (US Sales Only); INIS.

Collective octupole dynamics have been studied including nonaxial components of the octupole mean field, mainly at superdeformed shape in the Hg-Pb region. Both the Strutinsky method combined with cranking and the generator coordinate method within the self-consistent Hartree-Fock basis suggest the existence of collective octupole excitations at the superdeformed minima. GCM calculations point out to the E1 transitions as their most prominent experimental manifestation. The influence of the nonaxial octupole components on octupole dynamics in traditional octupole region of Ra-Th nuclei is also discussed. (authors) 38 refs., 6 figs., 1 tab.

16857 (CONF-9410324–1) **Shell model the Monte Carlo way.** Ormand, W.E. Oak Ridge National Lab., TN (United States). [1995]. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; FG05-93ER40770. From International workshop on structure and dynamics of quantum many-body systems; Aizn (Japan); 19-21 Oct 1994. Order Number DE95008783. Source: OSTI; NTIS; INIS; GPO Dep.

The formalism for the auxiliary-field Monte Carlo approach to the nuclear shell model is presented. The method is based on a linearization of the two-body part of the Hamiltonian in an

imaginary-time propagator using the Hubbard-Stratonovich transformation. The foundation of the method, as applied to the nuclear many-body problem, is discussed. Topics presented in detail include: (1) the density-density formulation of the method, (2) computation of the overlaps, (3) the sign of the Monte Carlo weight function, (4) techniques for performing Monte Carlo sampling, and (5) the reconstruction of response functions from an imaginary-time auto-correlation function using MaxEnt techniques. Results obtained using schematic interactions, which have no sign problem, are presented to demonstrate the feasibility of the method, while an extrapolation method for realistic Hamiltonians is presented. In addition, applications at finite temperature are outlined.

16858 (FEI–2345) **Phase transformations in barium, cerium and neodymium isotopes.** Seregin, A.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1993. 18p. (In Russian). Order Number DE95628973. Source: OSTI; NTIS (US Sales Only); INIS.

A method of the definition of the phase transition in experimental dependences is proposed. On the basis of this method the analysis of the energies of the excited states 2_1^+ and 4_1^+ depending on the number of the neutrons is carried out for the barium, cerium and neodymium isotopes. It is shown that these dependences are functions of many figures and consequently they can be regarded as the phase transitions. The meanings of the critical parameters n_c = 81 - 82 and critical index α = 0.5 - 0.6 are found and their dependences from the charge of nucleus and of the spin of states are investigated. 6 refs., 5 figs., 1 tab.

Institute of Nuclear Physics, Cracow (Poland). Oct 1992. 26p. Grant KBN 20204 91 01. Order Number DE95628974. Source: OSTI; NTIS; INIS.

We study interactions of a proton impurity with density oscillations of the neutron matter in a Debye approximation. The proton-phonon coupling is of the deformation-potential type at long wavelengths. It is weak at low density and increases with the neutron matter density. We calculate the proton's effective mass perturbatively for a weak coupling, and use a canonical transformation technique for stronger couplings. The proton's effective mass grows significantly with density, and at higher densities the proton impurity can be localized. This behaviour is similar to that of the polaron in solids. We obtain properties of the localized proton in the strong coupling regime from variational calculations, treating the neutron in the Thomas-Fermi approximation. (author). 14 refs, 8 figs.

16863 (INP–1606/PH) **Self-consistent proton crystallization in dense neutron star matter.** Kutschera, M. (Institute of Nuclear Physics, Cracow (Poland)); Wojcik, W. Institute of Nuclear Physics, Cracow (Poland). Nov 1992. 23p. Grant KBN 20204 91 01. Order Number DE95628975. Source: OSTI; NTIS; INIS.

We construct a solid-like variational wave functions for protons localized in dense neutron star matter. The localized protons are centered on the lattice sites and the neutron background is described by periodic Bloch wave functions. The self-consistent periodic structure arises due to a collective mean field. For low proton fraction the periodic potential is weak and the neutron Fermi surface is well approximated by a sphere. With the Skyrme forces we find that the proton solid is of lower energy than a uniform matter for densities above $n_l \approx 4\ n_0$, where $n_0 = 0.17\ fm^{-3}$ is the nuclear saturation density. We discuss implications of the proton crystallization for properties of dense matter in neutron stars. (author). 7 refs, 8 figs.

16864 (INP–1641/PH) **Nuclear symmetry energy and structure of dense matter in neutron stars.** Kutschera, M. (Institute of Nuclear Physics, Cracow (Poland)). Institute of Nuclear Physics, Cracow (Poland). Jul 1993. 10p. Grant KBN 20204 91 01; Grant KBN 20054 91 01. Order Number DE95628976. Source: OSTI; NTIS; INIS.

Consequences for neutron star matter of the behaviour of symmetry energy which results in disappearing of protons at high densities are explored. It is shown that interactions responsible for disappearance of protons tend to separate protons and neutrons at lower densities. Two separation mechanisms are considered: a bulk separation of protons and neutrons and formation of a neutron bubble around a single proton. The latter one corresponding to trapping of protons in the neutron background bubbles is more likely to occur in neutron star matter. In this case protons form polarons which are localized. (author). 16 refs, 2 figs.

16865 (JINR-E–3-94-403) **Excitation Study of High-Lying States of Differently Shaped Heavy Nuclei by the Method of Two-Step Cascades.** Boneva, S.T.; Khitrov, V.A.; Sukhovoj, A.M.; Vojnov, A.V. Submitted to Nuclear Physics. A.

Recently obtained primary transition intensities from two-step gamma-ray cascade investigation in 14 heavy nuclei: ^{137,138,139}Ba, ^{146}Nd, ^{150}Sm, ^{156,158}Gd, ^{160}Tb, ^{164}Dy, ^{168}Er, ^{174}Yb, ^{181}Hf, ^{196}Pt, ^{198}Au are analyzed. Experiments based on thermal neutron capture were undertaken mainly at the Frank Laboratory of Neutron Physics. Comparing these measured intensities and statistical model predictions, some properties of compound-state depopulation were derived. For the spherical nuclei of ^{137,138,139}Ba and ^{146}Nd very intense cascades with high-energy primary transitions were observed. Rather different is the behaviour of the cascade intensity in the strongly deformed nuclei of ^{156,158}Gd, ^{160}Tb, ^{164}Dy, ^{168}Er and in transitional nucleus of ^{150}Sm -intensity of primary gamma-rays with $E_1 \approx$ 2-3 MeV overestimates the calculated value by more than one order of magnitude. 22 refs., 5 figs., 3 tabs.

To be published in Proceedings of the International Conference on Nuclear Shapes and Nuclear Structure, Antibes, France, 20-25 Jun 1994.

One of the main topics of modern nuclear physics is the investigation of exotic nuclei including hyper-nuclei, trans fermium elements, proton and neutron rich isotopes near drip lines as well as high-spin excited states and states with anomalous deformation. The isomerism of nuclei is closely related with such phenomena as the alignment of single-particle orbitals, the coexistence of various deformations and the manifestation of intruder-levels from neighbouring shells. The investigation of electromagnetic and nuclear interactions of isomers could give important information on their shell structure and its role in the mechanism of nuclear reactions. For such experiments one can either make isomeric targets (sufficiently long-lived) or use the methods of acceleration of isomeric nuclei. Recently, an exotic 16^+ four-quasiparticle isomer of ^{178}Hf$^m_2$ was produced in a micro weight quantity and the first nuclear reactions on it were successfully observed. The talk describes these experiments as well as new ideas for the continuation of the studies and some advantageous ways for the isomeric beams production by the method of direct acceleration or by the secondary beam method. 35 refs., 15 figs., 8 tabs.

Among the more attractive radionuclides for lung and liver imaging in children and adults, particularly in cardiovascular examinations, is ^{178}Ta. This radionuclide is readily available from the radionuclide generator ^{178}W EC ($T_{1/2}$ = 21.7d) ^{178}Ta EC,β^+($T_{1/2}$ = 9.3min) ^{178}Hf (stable). The long lived ^{178}W ($T_{1/2}$ = 21.7d) decay entirely by EC to 9.3 m ^{178}Ta daughter without feeding the high spin isomer ($T_{1/2}$ = 2.2 h) in ^{178}Ta. The short lived ^{178}Ta then decays to stable ^{178}Hf, 98.2% by EC and 1.1% by β^+ emission. In this paper, the authors report the excitation function for the ^{181}Ta(p,4n)^{178}W reaction in the proton energy range of 28.8-71.8 MeV.

16872 (BNL–61149, pp. 226-231) **Determination of excitation functions for ^{20}Ne(p,p2n)^{18}Ne $\rightarrow$ ^{18}F and ^{20Ne}(p,2n)^{18}F and a reexamination of production of [^{18}F]F_2 with protons on neon.** Reddy, G.N. [^{18}F]F-Labelled radiopharmaceutical continue to play a major role for the development of positron emission tomography (PET) as an in vivo modality in biomedical research. The half-life (109.6 min) of [^{18}F]F provides an ideal time for PET investigations. It could be produced in two reactive Forms: (a) as nucleophilic fluoride and (b) as electrophilic fluorine gas. The most commonly employed two nuclear processes are: ^{20}Ne(d,α)^{18}F and ^{18}O(p,n)^{18}F. The latter process is predominantly used for the production of NCA [^{18}F]fluoride by bombarding [^{18}O] water with protons and has been studied elaborately. The former process is mostly used for the production of carrier-added [^{18}F]F_2 by deuteron bombardment. Generation of [^{18}F]F_2 with protons on [^{18}O]O_2 has been implemented, but this method needs optimization. Thus, PET centers that do not have dual particle accelerators are limited in methods for the production of [^{18}F]F_2. Nonetheless, the PET centers with medium energy proton (35-40 MeV) cyclotrons, have a better probability for the production of [^{18}F]F_2. It could be generated by ^{20}Ne(p,x)^{18}F reaction. This process has not been studied in detail and is being used only at TRIUMPH, UBC PET Center in Vancouver, Canada. At this Institute, two injectors of proton energy 72 MeV are in use for isotope production and hence this nuclear process was examined in detail.

16873 (BNL–61514) **Pion interferometry in E814 – Toward equilibrium at the AGS.** Xu, N. (State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics). E814 Collaboration. Brookhaven National Lab., Upton, NY (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950180–1: 10. winter workshop on nuclear dynamics, Snowbird, UT (United States), 15-21 Jan 1995). Order Number DE95008860. Source: OSTI; NTIS; INIS; GPO Dep.

The ultimate goal of ultra-relativistic heavy-ion program at the BNL AGS and CERN SPS is to study highly excited nuclear matter

and the transition from hadronic matter to quark gluon plasma. In the QGP state, quarks and gluons are no longer confined but they move freely in a fairly large volume. According to their knowledge, the de-confined state can be approached via either compression or heating of nuclear matter in heavy-ion collisions. At AGS energies, the most relevant process is believed to be compression. However, before the authors try to identify any exotic events such as, for example QGP phase transition or chiral symmetry restoration, they have to answer the following questions: (1) Were the densities(due to the compression) high enough? (2) Was the high density region large enough? (3) Was the system thermalized? The authors report recent pion interferometry results from AGS experiment E814. By comparing to the results of RQMD calculations, a freeze-out size R_{rms} = 8.3 fm is found in Si + Pb central collisions. A consistent thermal equilibration picture is established by comparing experimental data with the results of both hydrodynamic and cascade model calculations.

16874 (BNL–61522) **Particle production at AGS energies.** Steadman, S.G. (Massachusetts Institute of Technology, Cambridge, MA (United States)); Rothschild, P.J.; Sung, T.W.; Zachary, D. Brookhaven National Lab., Upton, NY (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-940169–11: 10. winter workshop on nuclear dynamics, Snowbird, UT (United States), 15-21 Jan 1994). Order Number DE95008856. Source: OSTI; NTIS; INIS; GPO Dep.

The authors discuss particle production from 14.6 A·GeV/c Si and 11.6 A·GeV/c Au projectiles on Al and Au targets. The second-level trigger utilized by E859 allows high precision measurements of K^-, $\bar{p}$, Λ and $\bar{\Lambda}$. The $\bar{\Lambda}$ yield is larger than expected, and a surprisingly large fraction of the $\bar{p}$'s are observed to arise from the decay of $\bar{\Lambda}$.

16875 (CONF-9409150–1) **Study of heavy ion collisions ^{58}Ni + ^{24}Mg and ^{79}Br + ^{27}Al at 11 MeV/nucleon.** Shapira, D. (Oak Ridge National Lab., TN (United States)); Gomez Del Campo, J.; Korolija, M.; Chavez, E.L.; Ortiz, M.E.; Dacal, A. Oak Ridge National Lab., TN (United States). 23 Jan 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From CAM '94: Canadian-American-Mexican physics meeting; Cancun (Mexico); 26-30 Sep 1994. Order Number DE95010279. Source: OSTI; NTIS; INIS; GPO Dep.

Nucleus-nucleus fusion and factors governing it has been the subject of many studies below the Coulomb barrier up to bombarding energies near 10 MeV/nucleon. Understanding of this process has increased during the last few decades, but there remain outstanding questions such as: fusion below the nucleus-nucleus Coulomb barrier resonances in light systems, and cross section magnitudes for heavier systems, saturation of fusion cross sections at high bombarding energies in light nuclear system, and emission of light particles from hot compound nuclei at energies well below the separation barrier, to name a few. At bombarding energies between 10 and 10O MeV/nucleon processes other than complete fusion become important, and interpretation of reaction data becomes increasingly complicated. Exclusive studies of particle production in nuclear reactions at these energies mandate the use of large arrays of particle detectors. The work reported here presents results of studies at the lower end of this energy range performed with a large detector array for charged particles-HILI; it concentrates on the nickel-58 + magnesium-24 reaction.

16876 (DOE/ER/40370–7) **Theory of photon and electron induced reactions. Progress report, July 1, 1994–June 30, 1995.** Onley, D.S.; Wright, L.E. Ohio Univ., Athens, OH (United States). Dept. of Physics and Astronomy. Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER40370. Order Number DE95010535. Source: OSTI; NTIS; INIS; GPO Dep.

During the first year and half of the current grant from the Department of Energy the authors have made considerable progress on the following aspects of the general investigation of electron and photon induced reactions: (a) photo and electroproduction of mesons from nuclei; (b) approximate Coulomb distortion effects on (e,e′) and (e,e′p) in the quasi-elastic region; and (c) quark models. The authors report on each of these developments in the following sections.

16877 (FEI–2363) **Inelastic neutron spectra and cross sections for ^{238} U.** Kornilov, N.V.; Kagalenko, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 24p. (In Russian, English). Order Number DE95628985. Source: OSTI; NTIS (US Sales Only); INIS.

The report discusses the experimental facilities of IPPE, results of spectra and cross sections investigations. The problems of existing data libraries were highlighted. Some of these problems for example, inelastic spectra at high energy may be solved by correct theoretical calculation. Others like level cross sections at E > 2 MeV and the possible structure of excitation function for group levels between 0.5 to 0.85 MeV demand new experimental efforts. 21 refs., 11 figs., 5 tabs.

16878 (FNAL/C–95/018) **Some highlights of the recent Fermilab Fixed Target Program of interest to the nuclear physics community.** Conrad, J. (Columbia Univ., New York, NY (United States)); Papavassiliou, V.; Zielinski, M. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950165–2: DNP/NSAC town meeting on nuclear physics with intermediate energy and high-energy hadron probes, Chicago, IL (United States), 29-30 Jan 1995). Order Number DE95009108. Source: OSTI; NTIS; INIS; GPO Dep.

Many of the high energy physics questions addressed by the Fermilab Fixed Target Experiments are also of interest to the members of the nuclear community. Some recent highlights of the program, including studies of A-dependence of cross sections, evidence for parton rescattering in nuclear media, studies of heavy quark production, evidence for color transparency, and insights into QCD from meson systems, are discussed.

16879 (GSI–95-09(prepr.)) **The photodissociation of ^{8}B and the solar neutrino problem.** Bertulani, C.A. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jan 1995. 36p. Order Number DE95770054. Source: OSTI; NTIS (US Sales Only); INIS.

The extraction of the photodissociation cross sections of ^{8}B from Coulomb dissociation experiments is investigated. A careful study is done on the contributions of the E1, E2 and M1 multipolarities to the breakup. A comparison with the data of a recent experiment is performed. It is shown that the extraction of the radiative capture cross sections ^{7}Be(p, γ)^{8}B which are relevant for the solar neutrino problem is not affected appreciably by Coulomb reacceleration. A non-perturbative model is used for the purpose. Emphasis is put on the perspectives for future experiments which are planned at the University of Notre Dame, RIKEN (Japan), and GSI (Germany). An analysis of the total yields of "photon-point" processes in inelastic electron scattering is also done. (orig.)

16880 (GSI–95-10(prepr.)) **Probing the ground state and transition densities of halo nuclei.** Bertulani, C.A. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Sagawa, H. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jan 1995. 32p. Order Number DE95770053. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate the use of elastic and inelastic scatterings with secondary beams of radioactive nuclei as a mean to obtain information on ground state densities and transition matrix elements to continuum states. An eikonal model is developed for this purpose by using the folding potential. In particular we discuss possible signatures of halo wavefunctions in elastic and inelastic scattering experiments. (orig.)

16881 (GSI–95-11(prepr.)) **The disappearance of flow.** Soff, S. (Frankfurt Univ. (Germany). Inst. fuer Theoretische Physik); Bass, S.A.; Hartnack, C.; Stoecker, H.; Greiner, W. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jan 1995. 20p. Order Number DE95770051. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate the disappearance of collective flow in the reaction plane in heavy-ion collisions within a microscopic model (QMD). A systematic study of the impact parameter dependence is performed for the system Ca+Ca. The balance energy strongly increases with impact parameter. Momentum dependent interactions

reduce the balance energies for intermediate impact parameters b≈4.5 fm. Dynamical negative flow is not visible in the laboratory frame but does exist in the contact frame for the heavy system Au+Au. For semi-peripheral collisions of Ca+Ca with b≈6.5 fm a new two-component flow is discussed. Azimuthal distributions exhibit strong collectiv flow signals, even at the balance energy. (orig.)

16882 (GSI–95-13(prepr.)) **Probing the nuclear liquid-gas phase transition.** Pochodzalla, J. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Moehlenkamp, T.; Rubehn, T.; Schuettauf, A.; Woerner, A.; Zude, E. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Feb 1995. 15p. Order Number DE95770028. Source: OSTI; NTIS (US Sales Only); INIS.

Fragment distributions resulting from Au+Au collisions at an incident energy of E/A=600 MeV are studied. From the measured fragment and neutron distributions the mass and the excitation energy of the decaying pre-fragments were determined. A temperature scale was derived from observed yield ratios of He and Li isotopes. The relation between this isotope temperature and the excitation energy of the system exhibits a behavior which is expected for a phase transition. The nuclear vapor regime takes over at an excitation energy of 10 MeV per nucleon, a temperature of 5 MeV and may be characterized by a density of 0.15-0.3 normal nuclear density. (orig.)

16883 (IAEA-NDS–138) **JENDL-3.2/FPY. The JENDL-3.2 fission-product yield data library. Contents and documentation.** IAEA-NDS-Documentation series, IAEA-NDS-Documentation series. Lemmel, H.D. This data library contains neutron-induced fission-product yield data for ten fissile nuclides, some of them at 3 incident neutron energies, including independent yields and cumulative yields. The data library, which is in ENDF-6 format, is available, costfree, on magnetic tape or on diskette(s). (author).

16884 (IAEA-NDS–168) **The processed neutron activation cross-section data files of the FENDL project. Summary documentation.** IAEA-NDS-Documentation series, IAEA-NDS-Documentation series. Ganesan, S. (and others); Pashchenko, A.B.; Lemmle, H.D. (eds.); Mann, F.M. International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section. Sep 1994. 2p. Order Number DE95628986. Source: OSTI; NTIS (US Sales Only); INIS.

This document summarises a neutron activation cross-section database which has been processed in two formats for input to MCNP Monte Carlo codes and to REAC transmutation codes. The data are available from the IAEA Nuclear Data Section online via INTERNET by FTP command. (author).

16885 (INDC(CCP)–382) **Properties of standard-I mass channel in fission of Z-ODD nuclei.** Goverdovsky, A.A. (Institute of Physics and Power Engineering, Obninsk (Russian Federation)); Mitrofanov, V.F.; Khryachkov, V.A. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Dec 1994. 11p. Contract 93-02-3799. Order Number DE95628998. Source: OSTI; NTIS (US Sales Only); INIS.

Mass distributions of fission fragments in Am-243 (n,f) reaction have been measured for incident neutron energy from 1 to 3.7 MeV. The data were analyzed along the Brosa model. The attention was paid to behaviour of standard-I component which was observed to be strongly determined by excitation energy of the fissile system at the top of fission barrier. Results of the analysis showed that FF mass spectra of americium isotopes can be predicted for any incident neutron energy. The comparison with the data for other Am-nuclei measured is given. (author). 14 refs, 6 figs, 1 tab.

16886 (INDC(NDS)–323) **Improvement of measurements, theoretical computations and evaluations of neutron induced helium production cross sections. Summary report of the second research co-ordination meeting held in Beijing, China, from 1 to 4 November 1994.** Pashchenko, A.B. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Feb 1995. 21p. (CONF-9411145–: IAEA conference on improvement of measurements, theoretical computations, and evaluations of neutron-induced helium production cross sections, Beijing (China), 1-4 Nov 1994). Order Number DE95628987. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains the Summary of the 2nd Research Coordination Meeting (RCM) of the IAEA Co-ordinated Research Programme (CRP) on "Improvement of Measurements, Theoretical Computations and Evaluations of Neutron Induced Helium Production Cross Sections". The meeting was organized by the IAEA Nuclear Data Section (NDS) with co-operation and assistance of local organizers from the China Institute of Atomic Energy and held in Beijing, China, from 1 to 4 November 1994. The purpose of the RCM was to discuss the results obtained by the participating institutes under the CRP, to review the status of helium production cross section data and to work out a coordinated working programme for the participants. The meeting agenda, conclusions and recommendations, and the list of participants are presented in the summary report. (author).

16887 (INDC(USA)–106) **A survey of selected neutron-activation reactions with short-lived products of importance to fusion reactor technology.** Ward, R.C. (Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering and Engineering Physics); Gomes, I.C.; Smith, D.L. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Nov 1994. 88p. Order Number DE95628988. Source: OSTI; NTIS (US Sales Only); INIS.

The status of the cross sections for production of short-lived radioactivities in the intense high-energy neutron fields associated with D-T fusion reactors is investigated. The main concerns relative to these very radioactive isotopes are with radiation damage to sensitive components such as superconducting magnets, the decay-heat problem and the safety of personnel during operation of the facility. The present report surveys the status of nuclear data required to assess these problems. The study is limited to a few high-priority nuclear reactions which appear to be of critical concern in this context. Other reactions of lesser concern are listed but are not treated in the present work. Among the factors that were considered in defining the relevant reactions and setting priorities are: quantities of the elemental materials in a fusion reactor, isotopic abundances within elemental categories, the decay properties of the induced radioactive byproducts, the reaction cross sections, and the nature of the decay radiations. Attention has been focused on radioactive species with half lives in the range from about 1 second to 15 minutes. Available cross-section and reaction-product decay information from the literature has been compiled and included in the report. Uncertainties have been estimated by examining several sets of experimental as well as evaluated data. Comments on the general status of data for various high-priority reactions are offered. On the basis of this investigation, it has been found that the nuclear data are in reasonably good shape for some of the most important reactions but are unacceptable for others. Based on this investigation, the reactions which should be given the greatest attention are: $^{16}O(n,p)^{16}N$, $^{55}Mn(n,p)^{55}Cr$, $^{57}Fe(n,p)^{57}Mn$, $^{186}W(n,2n)^{185m}W$, and $^{207}Pb(n,n')^{207m}Pb$. (Abstract Truncated)

16888 (INIS-mf–14483, pp. 3-8) **Study of $^{124}Te(n,\gamma)^{125}Te$ reaction with thermal neutrons.** Honzatko, J. (Ceska Akademie Ved, Prague (Czech Republic). We have investigated the particle production and fragmentation of nuclei participating in the interactions of 10.6 GeV/n gold nuclei in nuclear emulsions. A new criteria has been developed to distinguish between the interactions of these gold nuclei with the light (H, C, N, O) and heavy (Ag, Br) target nuclei in the emulsion. This has allowed separate analyzes of the multiplicity and pseudorapidity distributions of the singly charged particles emitted in Au-(H, C, N, O) and Au-(Ag, Br) interactions, as well as of the models of breakup of the projectile and target nuclei. The pseudorapidity distributions show strong forward asymmetries, particularly for the interactions with the light nuclei. Heavy target nuclei produce a more severe breakup of the projectile gold nucleus than do the lighter targets. A negative correlation between the number of fragments emitted from the target nuclei and the degree of centrality of the collisions has been observed, which can be attributed to the total destruction of the relatively light target nuclei by these very heavy projectile nuclei. (author). 14 refs, 11 figs, 1 tab.

16912 (JINR-E–2-94-412) **Probing the in-Medium Effect in Kaon-Nucleus Interaction.** Eliseev, S.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Hanna, K.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 12p. Order Number DE95627329. The discrepancy between the experimental and the theoretical ratio R of the total cross sections, $R = \sigma(K^{+12}C)/6\sigma(K^{+}d)$, is intensively discussed. It is interpreted as a possible signal of partial deconfinement of the nucleons in nuclei in soft nuclear reactions at intermediate energies. More realistic predictions for nuclear in-medium effects were evaluated in the framework of Glauber multiple scattering theory. Results show that a more microscopical theory rather than the old optical model , on the one hand, is suitable for describing the interaction of K^--meson with carbon nucleus while, on the other hand, led to the disagreement with data for K^+-meson. This conclusion may be taken seriously into account as a new EMC-type effect. 26 refs., 3 figs.

Talk presented at the 12-th International Seminar on High Energy Physics and Quantum Chromodynamics, Dubna, Russia, 12-17 Sep 1994.

The Cascade-Exciton Model (CEM) of nuclear reactions has been extended to describe photonuclear disintegration at intermediate energies. Using the CEM and the ORNL version of the Intranuclear Cascade Model for incident energies higher than the giant dipole resonance (GDR) region, and a group theory formalism based on the Interacting Boson Model in the GDR region, we have analyzed a variety of data for reactions induced by photons with energies up to $\approx$ 1.2 GeV and target-nuclei from ^{12}C to ^{243}Am. The contributions of different photon absorption mechanisms and the relative role of different particle production mechanisms in these reactions are discussed. 41 refs., 7 figs., 1 tab.

Submitted to Zeitschrift fur Physik.

The problem of existence of the bound states of negative pions and neutrons has been widely discussed for the last years. It is considered possibilities of the experimental observation of pion-neutron clusters, if they do exist, in nucleus-nucleus collisions. The yields of exotic fragments $\pi^{-Z}n^{A}$ in the interactions of ^{12}C and ^{56}Fe with ^{208}Pb at the energies from 0.3 to 3.7 GeV per nucleon are calculated. For ^{40}Ar+ ^{238}U and ^{139}La+ ^{238}U collisions the calculations were performed at the energied of 1.8 GeV and 1.3 GeV per nucleon, respectively. These calculations were performed in the framework of the coalescence mechanism with the differential cross sections for pion and neutron production generated by fire-streak model. The differential cross sections for production of $\pi^{-1}n^{-2}$, $\pi^{-2}N^{2}$, $\pi^{-}n^{4}$, $\pi^{-4}n^{6}$, and $\pi^{-12}n^{6}$ were calculated. It is shown that the use of very heavy projectiles like ^{56}Fe and ^{139}La has a great advantage in the experimental search for the exotic clusters. 20 refs.; 8 figs.

The report presented at the workshop on Heavy Ion Fusion: Exploring the Variety of Nuclear Properties, Padova, Italy, May 25-27, 1994.

The production cross of the $^{252}102$ nuclide was measured in the $^{238}U(^{22}Ne, 8n)$-reaction by using the kinematical separator VASSILISSA and correlation technique. The obtained production cross section is compared to the ones for the (HI, 6n)-reactions leading to the same nuclide. The obtained $\langle\Gamma_n/\Gamma_{tot}\rangle$ values at the mean excitation energy 70 MeV were compared to the ones for neighbouring nuclides with the less Z and to the ones calculated from a statistical consideration. The dependencies of energy for the $\langle\Gamma_n/\Gamma_{tot}\rangle$ values are also obtained and discussed. 29 refs., 4 figs., 3 tabs.

Submitted to Yadernaya Fizika.

The relative angle distribution of coincident intermediate mass fragments has been studied for ^4He + Au collisions at 3.65 GeV/nucleon with the new 4π-setup FASA installed at the JINR synchrophasotron. Strong suppression of small relative angles is observed, which is attributed to the mutual Coulomb repulsion of emitted fragments. The multi-body Coulomb trajectory calculations are performed on the event-by-event basis, varying the decay lifetime of the fragmenting system as a parameter. The initial configurations for these calculations - fragment masses and charges, their start positions and velocities - are calculated with the statistical multifragmentation model. The charges, masses and excitation energies of the fragmenting nuclei are estimated within the intranuclear cascade approach. It is shown that the relative angle distribution of IMF's is very sensitive to the time scale of the multifragmentation process. The experimental data are well described assuming break-up of the system with less than 100 fm/c mean lifetime. 26 refs., 5 figs.

16917 (JINR-R–1-94-376) **Rapidity Distributions of π^- Mesons in (d, α, C)Ta Interactions at 4,2 GeV/c per Nucleon.** Bekmirzaev, R.N.; Kladnitskaya, E.N.; Muminov, M.M.; Sharipova, S.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 14p. (In Russian). Order Number DE95627302. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yadernaya Fizika.

The dependences of π^- rapidity distributions on transverse momentum for dTa, αTa, CTa interactions at 4,2 GeV/c per nucleon are studied. The influence of the target atomic weight on π^- rapidity and transverse momentum distributions for CC and CTa interactions are investigated. The increase of the relative yield of π^- mesons with small p_t in CTa interactions as compared with CC ones was observed. The experimental results for CTa interactions are compared with the calculation according to the quark-gluon string model (QGSM). The model reproduces qualitatively the experimental distributions of the π^- mesons and well describes the p_t dependence of ratio of π^- yields up to p_t = 0,5 GeV/c for CTa and CC interactions. (author). 15 refs., 9 figs., 2 tabs.

16918 (JINR-R–4-94-427) **Calculation of the Angular Correlation Coefficient for Muon Captures on ^{28}Si with Modern Shell Model.** Boschitz, E. (Karlsruhe Univ. (T.H.) (Germany). Inst. fuer

Experimentelle Kernphysik); Kuz'min, V.A.; Ovchinnikova, A.A.; Tetereva, T.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 14p. (In Russian). Order Number DE95628276. Source: OSTI; NTIS (US Sales Only); INIS.

The independent amplitudes and angular correlation coefficients are calculated for the capture of polarised muons by ^{28}Si with the excitation of 1_3^+-state in ^{28}Al. The several sets of nuclear shell model Hamiltonian parameters are used. Theoretical models give the good correspondence between the results of calculation of the independent amplitudes ratio x, the asymmetry coefficient $\alpha^{(0)}$ and the residual polarization of the recoil nucleus β. The angular correlation coefficients for $1_3^+ \rightarrow 0_1^+$ γ-transition are defined only by x quantity. In that case the results of calculation coincide practically and can be used for experimental data analysis. The available experimental data indicate that the ratio g_P/g_A differs from the standard value. For $1_3^+ \rightarrow 2_1^+$ γ-transition the correlation coefficients depend on x and multipole mixing ratio δ. The considered shell model parameter sets give the different values for δ. The further investigation of nuclear structure or direct experimental definition of the δ are necessary to extract the g_P/g_A value from the experimental data about this transition. 15 refs., 4 figs., 1 tab.

Submitted to At. Ehnerg.

The dynamics of electronuclear process created in a large nature-uranium target by a proton beam with energy 1 GeV simulated by means of Monte Carlo method. The fission of creating plutonium nuclei leads to a sharp rise in neutron density and, respectively, concentration of plutonium increases drastically too. For example, when current of accelerated protons equals 100 mA, the concentration of easy-fissile nuclei increases 4-5 times during first six months and is approximately doubled again during the next half-year. Because of increasing the neutron density in target periphery the leakage of neutrons rises hundreds times. During a year the heat yield on oncreases almost 50 times. At the same time the shape of space distribution of plutonium (the normalized distribution) is not changed. 3 refs.; 5 figs.; 1 tab.

Source: OSTI; NTIS; INIS; GPO Dep.

The abundances of light nuclei probe the later stages of the evolution of a system formed in a relativistic heavy-ion collision. After the system has cooled and expanded, nucleons in close proximity and moving with small relative momenta coalesce to form nuclei. Light nuclei production enables the study of several topics, including the mechanism of composite particle production, freeze-out temperature, size of the interaction region, and entropy of the system. NA44 is the only relativistic heavy-ion experiment to have both deuteron and anti-deuteron results in both pA and AA collisions and the first CERN experiment to study the physics topics addressed by d and $\bar{d}$ production.

Source: OSTI; NTIS; INIS; GPO Dep.

High energy heavy ion collisions provide the opportunity to create hadronic matter at high energy density and study its properties. In order to do this, one must characterize the collisions, ascertain the size and density of the hot system in the central region of the nucleus-nucleus system, and determine the energy density achieved. Furthermore, one needs to determine whether or not the system approaches equilibrium so thermodynamic descriptions may be used. One of the experimental tools available is the study of two-particle correlations to map the space-time extent of the system when the hadrons decouple. Other observables include the flow of energy and charged particles transverse to the beam and the rapidity distribution of protons to indicate the amount of stopping and randomization of the incoming energy. The transverse mass distributions of hadrons reflect the temperature of the system at freezeout and effects of radial expansion. The production ratios of different particles are related to the extent of chemical equilibrium reached in the collision and subsequent evolution of the hadron gas. The NA44 Experiment at CERN can address all of these observables, though here the author focus mainly on correlation measurements. Kaons and pions are emitted rather late in the evolution of a heavy ion collision, at the time of "freezeout" when the hadrons cease to interact. Their correlations reflect the space-time evolution of the later part of the collision. In addition to characterizing the collision, correlations can signal a phase transition as they measure the duration of hadronization and particle emission, which should be long in both a first- or second-order phase transition. Furthermore, correlation measurements offer an important tool to help disentangle effects of expansion from the freezeout temperature reflected in the single particle spectra.

16922 (UCRL-ID–118720) **Benchmarking of multiple preequilibrium routines in GNASH.** Chadwick, M.B. (Lawrence Livermore National Lab., CA (United States). Nuclear Div.); Young, P.G. Lawrence Livermore National Lab., CA (United States). Aug 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010414. Source: OSTI; NTIS; INIS; GPO Dep.

The authors compare two different models for multiple preequilibrium emission (MPE) in GNASH: the older exciton MPE model; and a new generalized MPE model which is parameter-free. They analyze the proton-induced reactions on zirconium and lead, which were the focus of a recent NEA intermediate-energy code intercomparison, using both the MPE models. They find that the new generalized MPE model better describes the measurements.

16923 (UCRL-ID–118721) **Photonuclear reactions in the GNASH code: Benchmarking model calculations for reactions on lead up to 140 MeV.** Chadwick, M.B. (Lawrence Livermore National Lab., CA (United States)); Young, P.G. Lawrence Livermore National Lab., CA (United States). Aug 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010415. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have developed the GNASH code to include photonuclear reactions for incident energies up to 140 MeV. Photoabsorption is modeled through the giant resonance at the lower energies, and the quasideuteron mechanism at the higher energies, and the angular momentum coupling of the incident photon to the target is properly accounted for. After the initial interaction, primary and multiple preequilibrium emission of fast particles can occur before compound nucleus decay from the equilibrated compound nucleus. The angular distributions from compound nucleus decay are taken as isotropic, and those from preequilibrium emission (which they obtain from a phase-space model which conserves momentum) are forward-peaked. To test the new modeling they apply the code to calculate photonuclear reactions on ^{208}Pb for incident energies up to 140 MeV.

In the framework of the European Technology Program for NET/ITER, ENEA (Italian Agency for New Technologies, Energy and Environment) - Frascati and CEA (Commissariat a L'Energie Atomique) - Cadarache collaborated on a Bulk Shield Benchmark Experiment using the 14-MeV Frascati Neutron Generator (FNG). The aim of the experiment was to obtain accurate experimental data for improving the nuclear database and methods used in shielding designs, through a rigorous analysis of the results. The experiment consisted of the irradiation of a stainless steel block by 14-MeV neutrons. The neutron reaction rates at different depths inside the block were measured by fission chambers and activation foils characterized by different energy response ranges. The experimental results have been compared with numerical results calculated using both S_N and Monte Carlo transport codes and as transport cross section library the European Fusion File (EFF). In particular, the present report describes the experimental and numerical activity, including neutron measurements and Monte Carlo calculations, carried out by the (ENEA Italian Agency for New Technologies, Energy and Environment) team.

16926 (INIS-mf–14518) **Inter-element effects correction due to the secondary x-ray fluorescence in pixe analysis technic.** Tchantchane, A. (Centre de Developpement des Techniques Nucleaires, Lab. des Techniques Nucleaires, Algiers (Algeria)); Benamar, M.A.; Benouali, A.; Azbouche, A.; Tobbeche, S. No corporate text available. Jan 1995. 7p. (In French). Order Number DE95628304. Source: OSTI; NTIS (US Sales Only); INIS.

For accurate determination of analyte concentration, on must take into account the effect of proton energy decrease and as a consequence a change in ionization cross sections as rthe beam penetrates the sample. Further one must also correct for matrix effects. This phenomena is due to the attenuation of the emerging X-rays from a major elements by a minor element which ha sa high coefficient absorption for this radiation. We present in this paper the work related to the developpement of a computer pragram for the estimation of such correction. We show the importance of this correction as function of the proton incident energy and of the sample type and its composition.

(Institute of Nuclear Physics, Cracow (Poland)); Gabanska, B.; Igielski, A.; Krynicka, E.; Woznicka, U. Institute of Nuclear Physics, Cracow (Poland). 1993. 33p. Grant KBN 20199 91 01. Order Number DE95629005. Source: OSTI; NTIS; INIS.

A method of the thermal neutron time decay constant measurement in small bounded media is presented. A 14 MeV pulsed neutron generator is the neutron source. The system of recording of a die-away curve of thermal neutrons consists of a ^{3}He detector and of a multichannel time analyzer based on analyzer Canberra 35+ with multi scaler module MCS 7880 (microsecond range). Optimum parameters for the measuring system are considered. Experimental verification of a dead time of the instrumentation system is made and a count-loss correction is incorporated into the data treatment. An attention is paid to evaluate with a high accuracy the fundamental mode decay constant of the registered decaying curve. A new procedure of the determination of the decay constant by a multiple recording of the die-away curve is presented and results of test measurements are shown. (author). 11 refs, 12 figs, 4 tabs.

16935 (SAND–95-0155C) **Adjoint electron-photon transport Monte Carlo calculations with ITS.** Lorence, L.J. (Sandia National Labs., Albuquerque, NM (United States)); Kensek, R.P.; Halbleib, J.A.; Morel, J.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950716–1: 32. annual IEEE international nuclear and space radiation effects conference, Madison, WI (United States), 17-21 Jul 1995). Order Number DE95006814. Source: OSTI; NTIS; INIS; GPO Dep.

A general adjoint coupled electron-photon Monte Carlo code for solving the Boltzmann-Fokker-Planck equation has recently been created. It is a modified version of ITS 3.0, a coupled electronphoton Monte Carlo code that has world-wide distribution. The applicability of the new code to radiation-interaction problems of the type found in space environments is demonstrated.

16936 (UCRL-ID–118400) **Program EPICP: Electron photon interaction code, photon test module. Version 94.2.** Cullen, D.E. Lawrence Livermore National Lab., CA (United States). Sep 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009382. Source: OSTI; NTIS; GPO Dep.

The computer code EPICP performs Monte Carlo photon transport calculations in a simple one zone cylindrical detector. Results include deposition within the detector. transmission, reflection and lateral leakage from the detector, as well as events and energy deposition as a function of the depth into the detector. EPICP is part of the EPIC (Electron Photon Interaction Code) system. EPICP is designed to perform both normal transport calculations and diagnostic calculations involving only photons, with the objective of developing optimum algorithms for later use in EPIC. The EPIC system includes other modules that are designed to develop optimum algorithms for later use in EPIC; this includes electron and positron transport (EPICE), neutron transport (EPICN), charged particle transport (EPICC), geometry (EPICG), source sampling (EPICS). This is a modular system that once optimized can be linked together to consider a wide variety of particles, geometries, sources, etc. By design EPICP only considers photon transport. In particular it does not consider electron transport so that later EPICP and EPICE can be used to quantitatively evaluate the importance of electron transport when starting from photon sources. In this report I will merely mention where we expect the results to significantly differ from those obtained considering only photon transport from that obtained using coupled electron-photon transport.

16937 (UCRL-ID–119045) **Differencing the diffusion equation on unstructured meshes in 2-D.** Palmer, T.S. Lawrence Livermore National Lab., CA (United States). 24 Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010410. Source: OSTI; NTIS; INIS; GPO Dep.

During the last few years, there has been an increased effort to devise robust transport differencings for unstructured meshes, specifically arbitrarily connected grids of polygons. Adams has investigated unstructured mesh discretization techniques for the even- and odd-parity forms of the transport equation, and for the more traditional first-order form. Conversely, development of unstructured mesh diffusion methods has been lacking. While Morel, Kershaw, Shestakov and others have done a great deal of work on diffusion schemes for logically-rectangular grids, to the author's knowledge there has been no work on discretizations of the diffusion equation on unstructured meshes of polygons. In this paper, the authors introduce a point-centered diffusion differencing for two-dimensional unstructured meshes. They have designed the method to have the following attractive properties: (1) the scheme is equivalent to the standard five-point point-centered scheme on an orthogonal mesh; (2) the method preserves the homogeneous linear solution; (3) the method gives second-order accuracy; (4) they have strict conservation within the control volume surrounding each point; and (5) the numerical solution converges to the exact result as the mesh is refined, regardless of the smoothness of the mesh. A potential disadvantage of the method is that the diffusion matrix is asymmetric, in general.

Atomic properties, such as radiative lifetimes, hyperfine structures and isotope shift, have been studied both theoretically and experimentally. Computer programs which calculate these properties from multiconfiguration Hartree-Fock (MCHF) and configuration interaction (CI) wave functions have been developed and tested. To study relativistic effects, a program which calculates hyperfine structures from multiconfiguration Dirac-Fock (MCDF) wave functions has also been written. A new method of dealing with radial non-orthogonalities in transition matrix elements has been investigated. This method allows two separate orbital sets to be used for the initial and final states, respectively. It is shown that, once the usual orthogonality restrictions have been overcome, systematic MCHF calculations are able to predict oscillator strengths in light atoms with high accuracy. In connection with recent high-power laser experiments, time-dependent calculations of the atomic response to intense laser fields have been performed. Using the frozen-core approximation, where the atom is modeled as an active electron moving in the average field of the core electrons and the nucleus, the active electron has been propagated in time under the influence of the laser field. Radiative lifetimes and hyperfine structures of excited states in sodium and silver have been experimentally determined using time-resolved laser spectroscopy. By recording the fluorescence light decay following laser excitation in the vacuum ultraviolet spectral region, the radiative lifetimes and hyperfine structures of the $7p^2P$ states in silver have been measured. The delayed-coincidence technique has been used to make very accurate measurements of the radiative lifetimes and hyperfine structures of the lowest 2P states in sodium and silver. 77 refs, 2 figs, 14 tabs.

16941 (UCRL-JC–118297) **Experiments with highly charged ions up to bare U^{92+} on the electron beam ion trap.** Beiersdorfer, P. Lawrence Livermore National Lab., CA (United States). Jul 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940707–1: 14. international conference on atomic physics, Boulder, CO (United States), 31 Jul - 5 aug 1994). Order Number DE95008827. Source: OSTI; NTIS; INIS; GPO Dep.

An overview is given of the current experimental effort to investigate the level structure of highly charged ions with the Livermore electron beam ion trap (EBIT) facility. The facility allows the production and study of virtually any ionization state of any element up to bare U^{92+}. Precision spectroscopic measurements have been performed for a range of $\Delta n = 0$ and $\Delta n = 1$ transitions. Examples involving 3-4 and 2-3 as well as 3-3 and 2-2 transitions in uranium ions are discussed that illustrated some of the measurement and analysis techniques employed. The measurements have allowed tests of calculations of the the quantum electrodynamical contributions to the transitions energies at the 0.4% level in a regime where $(Z\alpha) \approx 1$.

6643 Collision Phenomena

16942 (IBAMD–48) **International bulletin on atomic and molecular data for fusion. No. 48.** International Atomic Energy Agency, Vienna (Austria). Atomic and Molecular Data Unit. Oct 1994. 212p. Order Number DE95627357. Source: OSTI; NTIS (US Sales Only); INIS.

This bulletin provides atomic and molecular data references relevant to thermonuclear fusion research and technology. In part I the indexing of the papers is given separately for (i) structure and spectra (energy levels, wavelengths; transition probabilities, oscillator strengths; interatomic potentials), (ii) atomic and molecular collisions (photon collisions, electron collisions, heavy particle collisions), and (iii) surface interactions (sputtering, surface damage, blistering, flaking, arcing, chemical reactions). Part II contains the bibliographic data for the above listed topics and for plasma composition and impurities, plasma heating, cooling and fuelling, high energy laser- and beam- matter interaction, bibliographic and numerical data collections, and on interaction of atomic particles with fields. Also included are sections on atomic and molecular data needs for fusion research and on news about ALADDIN (A Labelled Atomic Data Interface) and evaluated-data bases.

16943 (IC–95/30) **Quantum versus semiclassical treatment of multiphonon effects in He atom scattering from surfaces.** Bilic, A. (Institute of Physics of the Univ., Zagreb (Croatia)); Gumhalter, B. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 48p. Order Number DE95628309. Source: OSTI; NTIS (US Sales Only); INIS.

We develop a formalism appropriate for studying multiple inelastic scattering of thermal energy. He atoms from surface phonons in the collision regimes in which both the motion of the particle and surface vibrations must be treated quantum-mechanically. Having in mind recent experiments on He atom scattering (HAS) from surfaces were first point out some difficulties connected with calculating the reflection coefficients under extreme multiphonon conditions by resorting to the standard T-matrix approach. To circumvent these problems we make use of the connection between the reflection coefficients and angular resolved scattering spectra and show how the latter can be conveniently obtained in the form of a cumulant expansion for multiphonon scattering amplitudes in powers of inelastic atom-surface coupling. In the scattering regimes in which the contributions of correlated multiphonon excitations become negligible relative to those of uncorrelated ones, the scattering spectrum acquired a particularly simple form of an exponentiated Born approximation (EBA). We find that under the conditions of these experiments the EBA can be considered as exact which enables accurate calculation of the corresponding multiphonon scattering spectra. The obtained results compare nicely with experimental data, confirming thereby the potentiality and applicability of the developed formalism in HAS. We also show that the semiclassical trajectory and fast collision or impulse approximations, which naturally derive as special limits of the EBA, can largely deviate from the so defined exact EBA treatment in the considered range of the parameter space. From this we conclude that they may become unreliable in the scattering regimes in which either the validity of the EBA is violated or their deviation from the EBA is large. 62 refs, 7 figs.

16944 (INIS-JP–028, pp. 15-17) **Cross sections of electron capture process of low energy ions.** Hamamoto, Nariaki (Kyoto Univ. (Japan). Faculty of Engineering); Tanaka, Takashi; Ogura, Masahiko; Itoh, Akio; Imanishi, Nobutsugu; Saito, Manabu; Haruyama, Yoichi. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Cross sections of electron capture process have been measured for carbon ions passing through several carbon-containing molecular gas targets at energies between 0.5 and 5 keV/amu. Multiple-electron transfer processes are predominate in these complex molecules. (author).

16945 (INIS-JP–028, pp. 18-20) **Production cross sections of recoiled Ar ions in charge changing collisions of carbon ions on Ar atoms.** Saito, Manabu (Kyoto Prefectural Univ. (Japan)); Haruyama, Yoichi; Hamamoto, Nariaki; Yoshida, Koji; Itoh, Akio; Imanishi, Nobutsugu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Production cross sections of recoiled Ar ions have been measured in coincidence with charge-changed 2 MeV C^{q+} ions (q=2,3,4). The results indicate that the average charge of recoiled ions increases with increasing the number of captured or lost electrons of C^{q+} projectiles. Production cross sections of Ar^{i+} ions (i=1-6) can be fitted by independent-electron model (IEM), but measured cross sections for production of Ar^{7+} and Ar^{8+} ions were larger than fitted values by IEM. (author).

16946 (LA-UR–95-790) **Faddeev calculations of $p\mu$+p collisions: Effect of hyperfine splitting on the cross sections.** Hu, Chi-Yu (California State Univ., Long Beach, CA (United States). Dept. of Physics); Kvitsinsky, A.; Cohen, J.S. Los Alamos National Lab., NM (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950706–1: 19. international conference on the physics of electronic and the atomic collisions, Whistler (Canada), 26 Jul - 1 aug 1995). Order Number DE95007838. Source: OSTI; NTIS; INIS; GPO Dep.

The Faddeev equations, modified to remove long-range coupling between different channels, are solved in the total-angular-momentum representation for $p\mu$ + p collisions. S-wave elastic and hyperfine-transition cross sections are calculated with and without explicit inclusion of the hyperfine splitting ΔE. For hyperfine quenching the simpler approach without hyperfine splitting is found adequate at collision energies above about ΔE, but for elastic scattering it becomes adequate at somewhat higher energies. The present cross sections tend to fall in between earlier calculations done using a large Standard adiabatic expansion and those done using a two-state improved adiabatic expansion, but are closer to the former.

16947 (PNL-SA–24529) **Scaling of cross sections in ion-atom collisions.** DuBois, R.D. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941129–21: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95008938. Source: OSTI; NTIS; INIS; GPO Dep.

Differential electron emission at 15° is investigated for 50-500 keV/amu hydrogen impacting on He and H targets. From hydrogen particles (H, H^+, H_2^+, H_3^+) ratios of cross sections relative to proton impact data, it is shown how bound projectile electrons influence the differential electron emission and where different ionization mechanisms are important. It is demonstrated that the H_2^+ and H_3^+ molecular ions interact as though they are composed of independent nuclei with the appropriate number of bound electrons, the electronic structure of the components appearing to be unimportant.

16948 (SINS–2151/1) **Systematic study of L-shell ionization of some heavy elements by light ion bombardment.** Braziewicz, J. (Wyzsza Szkola Pedagogiczna, Kielce (Poland)); Braziewicz, E.; Chojnacki, S.; Pajek, M.; Semaniak, J.; Czarnacki, W.; Czyzewski, T.; Glowacka, L.; Jaskola, M.; Kobzev, A.P.; Trautmann, D. Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland). Sep 1993. 40p. Order Number DE95629020. Source: OSTI; NTIS; INIS.

As a result of bombardment with ^1H, ^2H, ^3He and ^4He ions having energies of 0.6-4.0 MeV, 0.3-2.0 MeV, 0.6-3.0 MeV and 0.8-4.0 MeV, respectively, of heavy elements targets, i.e. Hf, Ta, W, Re, Os, Ir, Pt, Au, Bi, values of characteristic X-ray production cross sections for L_1, $L_{\alpha_{1,2}}$, $L_{\beta_{1,4,6}}$, $L_{\beta_{2,3,5,6}}$, $L_{\gamma_{4,4}}$ lines as well as L_1, L_2 and L_3 subshells ionizations cross sections have been measured. The experimentally determined ionization cross sections have been compared with predictions of theories describing Coulomb ionization process, namely by ECPSSR theory by Brandt and Lapicki and by semiclassical approximation theory. (author). 39 refs, 6 figs, 8 tabs.

16949 (UCRL-JC–118363) **Excitation mechanisms of $2s_{1/2}$-$2p_{3/2}$ and $2p_{1/2}$-$2p_{3/2}$ transitions in U^{82+} through U^{89+}.** Decaux, V.; Beiersdorfer, P.; Osterheld, A. Lawrence Livermore National Lab., CA (United States). 14 Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940922–7: 7. international conference on physics of highly charged ions, Vienna (Austria), 19-23 Sep 1994). Order Number DE95010265. Source: OSTI; NTIS; INIS; GPO Dep.

A model based on detailed calculations of the electron-impact excitation of n = 2 electrons in the Li- to Ne-like uranium ions was developed to interpret and explain measurements on EBIT (Electron Beam Ion Trap). While only considering the direct excitation process provided a good model for the electric dipole (El) transitions, it was necessary for the magnetic dipole (MI) spectrum to include various additional excitation processes in the model. In particular, the model was expanded to include electron-impact excitation of n = 3 levels followed by radiative cascades. Moreover, excitation by the ionization of $2s_{1/2}$, $2p_{1/2}$, and $2p_{3/2}$ electrons and by radiative capture of beam electrons into excited levels was added. The new model demonstrates that the dipole-forbidden lines are almost exclusively produced by indirect excitation processes.

16950 (UCRL-JC–118364) **Wavelengths measurements of the He-like krypton K-shell spectrum.** Widmann, K.; Beiersdorfer, P.; Decaux, V. Lawrence Livermore National Lab., CA (United States). 13 Sep 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940922–6: 7. international conference on physics of highly charged ions, Vienna (Austria), 19-23 Sep 1994). Order Number DE95010264. Source: OSTI; NTIS; INIS; GPO Dep.

We present accurate measurements of the 1s2s, ls2p → ls^2 transitions of He-like krypton. The measurements were performed on the EBIT facility using a high-resolution crystal spectrometer and a precision of 50 ppM was achieved. Unlike earlier measurements from the GANIL accelerator, our results are in good agreement with recent theoretical predictions.

We discuss the problem of the evolution of the cellular communication system from the RNA world to progenote to the modern cell. Our method analyses syntactical structure of molecular fossils in the non-coding regions of DNA within the information-processing gene model developed earlier. We concluded that sequence-specific binding is an ancient communication process with its origin in the RNA world. Moreover, we illustrate our viewpoint using four evolution snapshots from the first RNA segments, some 4.1. billion years ago, to the first cell, 3.8 billion years ago. (author). 31 refs.

Lab. of Nuclear Problems); Rak, J.; Kravtsov, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. 10p. Order Number DE95627375. Source: OSTI; NTIS (US Sales Only); INIS.

The data of the experiment with the mixture H_2+^{4}He are analyzed in order to estimate muon transfer rates from the excited states of pμ-atoms to helium. The rates for n=3,4,5 were found to be equal: $\lambda^{(3)}=(2+-7)10^{10}$ s^{-1}; $\lambda^{(4)}=(16+-13)10^{11}$ s^{-1}; $\lambda^{(5)}=(75+-60)10^{11}$ s^{-1}. The program for further investigations of the μ-atomic and μ-molecular processes in the mixture of hydrogen and helium isotopes is discussed. 25 refs.; 2 figs.; 1 tab.

16954 (JINR-E–4-92-140) **Muon transfer rates in hydrogen isotope mesic atom collisions.** Adamczak, A. (and others); Chiccoli, C.; Korobov, V.I. An experiment aimed at producing antihydrogen atoms by the reaction of cold antiprotons stored in a Penning trap with injected ground state positronium atoms is described. The apparatus developed in an attempt to observe the charge conjugate reaction using proton projectiles is discussed. Technically feasible upgrades to this apparatus are identified which may allow, in conjunction with the PS200 trap, antihydrogen production at LEAR.

16957 (BNL–61149, pp. 59-68) **Formation of voids in a liquid target due to charge deposition.** Amini, B. (CTI, Inc., Knoxville, TN (United States)); Nutt, R.; Patton, D.C.; Bida, G. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

A new phenomenon which can occur in a liquid target as a result of charged particle (proton) irradiation is introduced. This phenomena is based on the fact that charge carriers in a liquid target are solely ions. Proton irradiation of a liquid target inherently causes positive charge deposition directly into the target material. To prevent charge buildup in the target material, the charge must be carried out by ions to the conducting walls. However, high collision rates of ions with background molecules impede charge transfer from the target material to the target walls. Localized positive charge buildup occurs allowing electrostatic pressure to overcome the gravitational pressure, leading to formation of voids. The electric field which is generated due to charge buildup can also cause a local breakdown of water molecules, and subsequently enhanced radiolysis. These and other phenomena which can occur due to charge buildup generally degrade the target yields, however, in some cases, they can contribute to increased heat transfer by conduction. Conditions for the formation of voids, enhanced radiolysis, and the required electric fields are also presented.

16958 (DOE/ET/53088–692) **Singular eigenfunctions for shearing fluids I.** Balmforth, N.J.; Morrison, P.J. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Feb 1995. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. Order Number DE95008952. Source: OSTI; NTIS; INIS; GPO Dep.

The authors construct singular eigenfunctions corresponding to the continuous spectrum of eigenvalues for shear flow in a channel. These modes are irregular as a result of a singularity in the eigenvalue problem at the critical layer of each mode. They consider flows with monotonic shear, so there is only a single critical layer for each mode. They then solve the initial-value problem to establish that these continuum modes, together with any discrete, growing/decaying pairs of modes, comprise a complete basis. They also view the problem within the framework of Hamiltonian theory. In that context, the singular solutions can be viewed as the kernel of an integral, canonical transformation that allows us to write the fluid system, an infinite-dimensional Hamiltonian system, in action-angle form. This yields an expression for the energy in terms of the continuum modes and provides a means for attaching a characteristic signature (sign) to the energy associate with each eigenfunction. They follow on to consider shear-flow stability within the Hamiltonian framework. Next, the authors show the equivalence of integral superpositions of the singular eigenfunctions with the solution derived with Laplace transform techniques. In the long-time limit, such superpositions have decaying integral averages across the channel, revealing phase mixing or continuum damping. Under some conditions, this decay is exponential and is then the fluid analogue of Landau damping. Finally, the authors discuss the energetics of continuum damping.

16959 (IC–95/42) **Monte Carlo simulation of the surface magnetic phase transition in chromium.** Mata, G.J. (International Centre for Theoretical Physics, Trieste (Italy)); Valera, M. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 12p. Order Number DE95628436. Source: OSTI; NTIS (US Sales Only); INIS.

Antiferromagnetic chromium is known to have a surface magnetic phase transition at a temperature T_s = 780K, which is well above its bulk Neel temperature, T_N = 311K. Electronic structure calculations predict an enhancement of the magnetic moment at the surface, due to changes in the local electronic environment. In order to ascertain the role of such an enhancement in the surface magnetic transition, we have modelled the surface by means of a classical Heisenberg model in which: (a) the magnitude of a given spin is equal to the value of the corresponding magnetic moment predicted by band structure calculations, (b) the exchange interaction J between spins is the same throughout the system, and (c) the exchange interaction is chosen so as to reproduce the bulk transition temperature. We find a ratio of surface to bulk transition temperature of T_S/T_N = 2.5, which is an excellent agreement with the experimental result. Our results suggest that the surface magnetic transition in chromium is driven by fluctuations in the orientation of the magnetic moments and that quantum fluctuations play a minor role. The flow of solids loaded suspension in cylindrical pipes has been the object of intense experimental and theoretical investigations in recent years. These types of flows are of great interest in

chemical engineering because of their important use in many industrial manufacturing processes. Such flows are for example encountered in the manufacture of solid-rocket propellants, advanced ceramics, reinforced polymer composites, in heterogenous catalytic reactors, and in the pipeline transport of liquid-solids suspensions. In most cases, the suspension microstructure and the degree of solids dispersion greatly affect the final performance of the manufactured product. For example, solid propellant pellets need to be extremely-well dispersed in gel matrices for use as rocket engine solid fuels. The homogeneity of pellet dispersion is critical to allow good uniformity of the burn rate, which in turn affects the final mechanical performance of the engine. Today's manufacturing of such fuels uses continuous flow processes rather than batch processes. Unfortunately, the hydrodynamics of such flow processes is poorly understood and is difficult to assess because it requires the simultaneous measurements of liquid/solids phase velocities and volume fractions. Due to the recent development in pulsed Fourier Transform NMR imaging, NMR imaging is now becoming a powerful technique for the non intrusive investigation of multi-phase flows. This paper reports and exposes a state-of-the-art experimental and theoretical methodology that can be used to study such flows. The hydrodynamic model developed for this study is a two-phase flow shear thinning model with standard constitutive fluid/solids interphase drag and solids compaction stresses. this model shows good agreement with experimental data and the limitations of this model are discussed.

16963 (CONF-9410165–13) **Magnetic excitations in a random exchange system $Fe_xMn_{1-x}TiO_3$.** Kawano, H. (Tokyo Univ., Minato-ku, Tokyo (Japan). Inst. for Solid State Physics); Yoshizawa, H.; Nicklow, R.M.; Ito, A. Oak Ridge National Lab., TN (United States). 24 Aug 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Neutron scattering; Sendai (Japan); 11-14 Oct 1994. Order Number DE95006626. Source: OSTI; NTIS; INIS; GPO Dep.

In order to examine the influence of exchange frustration on spin wave excitations, inelastic neutron scattering experiments have been performed on a random exchange system $Fe_xMn_{1-x}TiO_3$ with x = 0.00, 0.10, 0.25 and 0.33. For all three mixed systems, the magnetic excitation spectra consist of two components: a well-defined spin wave component and a broad damped component. The latter can be well fitted to a spectral weight function for a damped harmonic oscillator.

16964 (INIS-JP–028, pp. 85-87) **Observations of hydrogen traps produced in nickel bombarded with helium-3, helium-4 and hydrogen ions.** Nakata, Hirokazu (Kyoto Univ. (Japan). Faculty of Engineering); Matsuoka, Kohtarou; Takagi, Ikuji; Fujita, Haruyuki; Higasi, Kunio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Experimental studies on radiation-induced traps of deuterium in nickel bombarded with He^3, He^4 and H_3 ions were conducted at elevated temperatures using the nuclear reaction $D(^3He, p)^4He$. The trapped deuterium concentration increased with the bombardment dose and decreasing the sample temperature. Depth profiles of the trapped deuterium showed peaks just corresponding to the mean projected ranges of the bombardment ions. The traps would be attributed to radiation-induced defects such as vacancies and interstitials. (author).

16965 (INIS-JP–028, pp. 91-93) **Study on initial stage of hetero-epitaxial growth by glancing angle scattering of fast ions from surfaces.** Fujii, Yoshikazu (Kyoto Univ. (Japan). Faculty of Engineering); Toba, Kazuaki; Narumi, Kazumasa; Kimura, Kenji; Mannami, Michihiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Initial stages of epitaxial growth of lead chalcogenides on the (100) surface of SnTe under UHV conditions are studied from the angular distribution of scattered ions at glancing angle incidence of 0.7 MeV He ions on the growing surfaces. Real time measurement of the angular distribution is performed during the growth. Anomalous broadening of the angular distribution is observed at the initial stage of the growth. The broadening is attributed to the surface wrinkles induced by a square network of misfit edge dislocations. (author).

16966 (INIS-JP–029, pp. 95-97) **In-situ study of layer-by-layer growth of PbSe(111) surface by specularly reflected ion spectroscopy.** Nakajima, Kaoru (Kyoto Univ. (Japan). Faculty of Engineering); Narumi, Kazumasa; Kimura, Kenji; Mannami, Michihiko; Fujii, Yoshikazu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

At glancing angle incidence of fast ions on a crystal surface, most of the ions are specularly reflected from the surface. Spectroscopy of the ions, which is called 'Specularly Reflected Ion Spectroscopy (SRIS)', can be utilized for study of surface characterization. We report in-situ study of homoepitaxial growth of PbSe(111) by SRIS with 500 keV H^+. (author).

16967 (INIS-JP–029, pp. 104-106) **RBS measurements of optical thin films.** Tukuda, Y. (Kyoto Univ. (Japan). Faculty of Engineering); Ektessabi, A.M. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Residual gases and impurities in the materials which are evaporated by electron beams are considered to be one of the reasons for creation of optical inhomogeneity. Therefore we adapted a new method for processing of the zirconia evaporation material using vacuum sintering method. The Zirconia thin films are prepared under various conditions. Our experimental results show that the gas from zirconia affects the amount of oxygen in the thin film and consequently the inhomogeneity in optical thin films. (author).

16968 (INIS-JP–029, pp. 113-115) **Epitaxial growth of Al/Al_2O_3 multilayer structures.** Ishida, M. (Kyoto Univ. (Japan). Faculty of Engineering); Hirai, N.; Takaoka, G.H.; Yamada, I. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

In order to obtain Al-Al_2O_3 quantum effect devices, it is necessary to deposit epitaxially Al on Al_2O_3 and Al_2O_3 on Al. We have already obtained an epitaxial Al/Al_2O_3/Al structures on Si(111). In this paper, we have deposit Al/Al_2O_3/Al structures on Si(111), and investigated the crystallinity by using RBS. (author).

16969 (INIS-JP–029, pp. 125-127) **Characterization of single crystalline semiconductors by RBS measurements.** Itoh, Akira (Kyoto Univ. (Japan). Faculty of Engineering); Kimoto, Tsunenobu; Yoshimoto, Masahiro; Matsunami, Hiroyuki. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

N^+ implantation-induced damage in SiC was characterized by RBS (Rutherford Backscattering Spectroscopy) measurements. The channeling measurements revealed that as-implanted layers had crystalline structure with heavy damage. The damage can be reduced by high-temperature annealing at 1500-1600degC. A low sheet resistance of 860Ω/□ was obtained by 1600degC annealing. However, the electrical activation was still low (26%), which may be caused by the defects remaining in the implanted layers. (author).

16970 (INIS-JP–029, pp. 128-129) **Imperfection of GaAs/Si layers studied by RBS, SR-SAXS and TEM.** Okuda, Hiroshi (Kyoto Univ. (Japan). Faculty of Engineering); Vezin, V.; Osamura, Kozo; Oku, Takeo. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

The structure of gallium arsenide grown on Si substrates have been investigated by means of RBS, SR-SAXS, and TEM. The origin of the streaks and diffuse isotropic scattering appearing in the small-angle scattering has been investigated by TEM. The RBS technique was used to examine the as-grown and annealed sample condition in terms of channeling yield and thickness distribution. It was found that the origin of the streaks are in the GaAs layer, and that of the diffuse scattering at the GaAs/Si interface. (author).

16971 (INIS-JP–029, pp. 130-131) **Positron lifetime study of vacancies and their clusters in Ti_3Al.** Murakami, Takashi (Kyoto Univ. (Japan). Faculty of Engineering); Ogawa, Noriko; Shirai, Yasuharu; Yamaguchi, Masaharu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Vacancies and their properties have been studied on electron and proton irradiated Ti_3Al by using positron annihilation lifetime spectroscopy. No constitutional vacancies have been detected in the material; all constitutional point defects are substitutional antisite atoms. The irradiated material starts to recover around 250K, which is ascribed to the migration of vacancies. Above 300K microvoids are formed due to the existence of hydrogen atoms. Irradiated Ti_3Al almost recovers to the fully annealed state below 650K. (author).

16972 (INIS-JP–029, pp. 132-133) **A positron lifetime study of radiation defects in proton-irradiated Si.** Uno, Yasutada (Kyoto Univ. (Japan). Faculty of Engineering); Shirai, Yasuharu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Radiation defects in proton-irradiated FZ-Si has been investigated by using positron lifetime spectroscopy. During the isochronal annealing, the positron lifetime of radiation defects stays almost constant up to about 520K. At about 520K these defects migrate and form secondary defects. This temperature corresponds to the formation of hydrogen-induced planer defect in silicon, whose microstructure has been studied by high-resolution electron microscopy. Present positron lifetime study indicates that this secondary defect contains vacancies. The positron lifetime at this planer defect is about 330ps and radiation induced defects are completely annealed at 940K. (author).

16973 (INIS-JP–029, pp. 134-135) **Diffusion barrier properties of W between Si and Cu.** Uekubo, Masaki (Kyoto Univ. (Japan). Faculty of Engineering); Nii, Kazushi; Oku, Takeo; Murakami, Masanori. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In April, 1993, the Neutron Scattering Laboratory attached to the Institute for Solid State Physics, University of Tokyo, was newly established in Tokai, Ibaraki Prefecture, to promote nationwide users' programs for utilizing the university-owned neutron instruments installed at the JRR-3M reactor of Japan Atomic Energy Research Institute. This upgraded reactor (20 MW, the cold source is installed) has drastically expanded the number of users and research areas since 1990 when it became operational. Currently 8 and 3 out of 18 new spectrometers in total at the JRR-3M are owned by ISSP and Tohoku University, respectively, while the remaining 7 spectrometers belong to JAERI. In addition, 3 conventional spectrometers in the 30 years old JRR-2 reactor (10 MW) have also supported research activities. This is the first issue of 'Activity report on neutron scattering research', and it is to be published annually. In this report, the brief history of neutron scattering research, the users' programs, the committees, the neutron scattering instruments available at the JRR-3M and the JRR-2M, the activity reports on structures and excitation, magnetism, superconductors, liquid and glass, material science, polymers, biology and instrumentation, and publication list are reported. (K.I.).

16975 (INIS-mf–14483, pp. 33-36) **Phase analysis by Moessbauer spectroscopy.** Sitek, J. (Slovenska Vysoka Skola Technicka, Bratislava (Slovakia). Elektrotechnicka Fakulta). Source: OSTI; NTIS (US Sales Only); INIS.

Moessbauer spectra of individual iron-containing phases have their characteristic parameters and they usually differ from each other. From the relative areas of the separate spectral lines it is possible to determine the relative atomic abundance of the nuclide to be measured. Moessbauer spectroscopy is thus a useful nondestructive method for qualitative as well as quantitative analysis of the phase being present in the sample. Phase analysis using Moessbauer spectroscopy has found a widespread use in many fields of science and technology. (author) 1 fig., 2 refs.

^{57}Fe transmission Moessbauer spectroscopy was applied to the study of icosahedral quasicrystals. Using three-dimensional projections of quadrupole splitting distributions, magnetic and structural properties were investigated. $Al_{40}Cu_{10}Ge_{25}Mn_{25}$ icosahedral quasicrystals which had been doped for the purpose of Moessbauer spectroscopy to 0.1, 0.3 and 3 at.% by probing Fe atoms, showed a magnetic transition at 30 K. A structural origin of the transition was excluded on the basis of results obtained from measurements on the $Al_{65}Cu_{20}Fe_{15}$ icosahedral quasicrystal made in the same temperature range. The latter was exposed to mechanical activation in a ball mill for up to 800 hours. In the course of mechanical grinding a structural transformation from the quasicrystalline to the amorphous state took place. (author) 4 figs., 15 refs.

Source: OSTI; NTIS (US Sales Only); INIS.

Pulsed and broad-line proton NMR was used in investigation of both the molecular motions and the relaxations in oriented partially crystalline polypropylene (PP) fibres. Proton NMR measurements were made of the spin-lattice and rotating-frame relaxation times (T_1, T_{1r} resp.), spectra unfolding into elementary components and

the second moment of the spectra in the temperature range of 250-400 K for three kinds of drawn PP fibres. The fibres were made from isotactic PP marked as Tatren 430 produced by Slovnaft Bratislava. Relaxation time T_1 was measured by a multiple-pulse saturation recovery method. Rotating-frame data T_{1r} were obtained with radiofrequency field B_1=1.7 mT using the spin-locking method. The results of the experiments show that the differences in nuclear relaxation behavior are closely related to the structural changes (crystallinity and orientation) caused by the drawing process at different temperatures. (Z.S.) 4 figs., 10 refs.

Order Number DE95747917. Source: OSTI; NTIS; INIS.

The quadrupole moment of the β-emitting short-lived nucleus ^{12}N (I^{π}=1$^+$, $T_{1/2}$=11 ms) was measured by use of a modified β-NMR (NNQR) method. The ^{12}N nucleus is the good probe nucleus for studying its hyperfine interactions in solids. Using the eqQ value of ^{12}N in BN and GaN and the q values measured by FT-NMR detecting of ^{14}N in the crystals, the quadrupole moment of ^{12}N(1$^+$) was determined. Using the Q value, the electric field gradients of ^{12}N in various metals are deduced from the observed eqQ values. For the case of magnesium metal q value is compared with the one predicted by the first-principle super-cell band structure calculation. The agreement between the experimental result and the theoretical one is fairly good. (author).

Structural optimization based on the Korringa-Kohn-Rostoker band structure calculation is applied to Mg-N and Mg-Li super-cell structures simulating Mg based interstitial impurity systems. The resulting lattice relaxation of Mg atoms around the impurities turns out as big as 25-30%, which is bigger than the experimental indications. Calculated electric field gradients, combined with a recent NQR experimental result, on the other hand, yields the quadrupole moment of 12.7mb, being in a good agreement with other theoretical prediction. (author).

The high-temperature superconductor, $YBa_2Cu_4O_8$, with partial substitution of Ca for Y was investigated with a high-resolution Fourier neutron diffractometer over a wide temperature range. The ^{44}Ca isotope was used to increase neutron contrast. Structural analysis was performed for the spectra measured at 135, 165, and 293 K; the temperature dependence of the lattice parameters was determined from the points measured within the range of 8 to 288 K. The presence of a structural anomaly in the proximity of 150 K was confirmed. It manifests itself by a sharp change in the expansion coefficient along the b axis, irregular behaviour of the orthorhombicity coefficient, and a noticeable change in bond length. The most distinct change is a contraction of the distance between the Cu2 copper atom and the apical O1 oxygen, as well as change in the distance between the O2 and O3 atom chains in the CuO_2 layer. 8 refs., 4 figs., 3 tabs.

16992 (JINR-E–14-94-467) **Neutron Diffraction Study of the High-T_c Superconductor $HgBa_2CaCu_2O_{6.3}$ under High Pressure.** Aksenov, V.L. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics); Balagurov, A.M.; Savenko, B.N.; Antipov, E.V.; Putilin, S.N.; Capponi, J.J.; Glazkov, V.P.; Goncharenko, I.N.; Somenkov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 12p. Order Number DE95628443. Source: OSTI; NTIS (US Sales Only); INIS.

The pressure dependence of the crystal structure of a powder sample of $HgBa_2CaCu_2O_{6.3}$ (T_c=123 K) was studied in the pressure range of 0 to 3.6 GPa, using the DN-12 time-of-flight diffractometer at the IBR-2 pulsed reactor and a sapphire anvil cell chamber. At P=0 the results are in a good accordance with the published data. At P=3.0 and 3.6 GPa the best fit of the experimental data was achieved using the structural model with apical oxygen disordered in the (a,b) plane. The compressibility values of the lattice constants and selected bonds were calculated from the structural data. The highest absolute value of compressibility was found for the distance between the O atom layers. 12 refs., 6 figs., 3 tabs.

16993 (JINR-R–14-94-429) **Observation of Hysteresis at Spin-Flop Transition Induced by a Pulsed Magnetic Field.** Georgiev, D.; Nitts, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 14p. (In Russian). Order Number DE95628444. Source: OSTI; NTIS (US Sales Only); INIS.

The results of diffraction research of the spin-flop transitions in α-Fe_2O_3 and Cr_2O_3 performed on the SNIM-2 spectrometer of the IBR-2 pulsed reactor with the use of a pulsed magnetic field are presented. The field pulses had a sinusoidal form with a time duration of 400-1000 μs. The hysteresis dependences of the scattering intensity on the field value were obtained. In the case of hematite at amplitude changes of the magnetic pulses the hysteresis loop takes its utmost shape and width, which does not change with further increases in amplitude. The width of the utmost loop is almost one order less than the theoretical range of metastability of the phase states. At a decrease in temperature the width of the utmost loop decreases. In the case of Cr_2O_3 the hysteresis is observed at magnetic field amplitudes, which do not reach the critical value for phase transition. This testifies to a delay of the turning processor sublattice magnetization in the initial phase state. 11 refs., 12 figs.

16994 (JINR-R–14-94-430) **Weak Antiferromagnetism in $YFeO_3$ and $HoFeO_3$.** Georgiev, D.; Krezhov, K.; Nitts, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 4p. (In Russian). Order Number DE95628445. Source: OSTI; NTIS (US Sales Only); INIS.

Weak antiferromagnetism of Fe^{3+}-ions in $YFeO_3$ and $HoFeO_3$ by neutron diffraction at the SNIM-2 spectrometer using a pulse reactor IBR-2 is measured. The ratios between components of this antiferromagnetism and the main antiferromagnetic order are equal to 0.011 for $HoFeO_3$ (with precisions about 10%). 6 refs., 3 figs.

16995 (JINR-R–14-94-431) **Induced Antiferromagnetism in $HoFeO_3$.** Bujko, S.A.; Georgiev, D.; Krezhov, K.; Nitts, V.V.; Pasazhov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 10p. (In Russian). Order Number DE95628446. Source: OSTI; NTIS (US Sales Only); INIS.

Results from neutron diffraction studies of single crystal $HoFeO_3$ in pulsed magnetic field by means of the spectrometer SNIM-2 of JINR (Dubna) are presented. The weak antiferromagnetism induced by the applied field in the Fe^{3+}- and Ho^{3+}-ions sublattices is measured in the temperature range 79-154 K. The temperature dependence of the antiferromagnetic susceptibility of the holmium

subsystem is derived and found to obey the Curie-Weiss law. 11 refs., 12 figs.

16996 (LNS–176) **Neutron scattering experiments on cuprates of the type $R_{1-x}Ce_xLaCuO_4$ (R=Pr, Nd; $0 \leq x \leq 0.2$).** Gutmann, M. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Eidgenoessische Technische Hochschule, Zurich (Switzerland). Lab. fuer Neutronenstreuung. Mar 1995. 77p. (In German). Order Number DE95628447. Source: OSTI; NTIS; INIS.

Using a sol-gel-technique, samples of $Nd_{1-x}Ce_xLaCuO_4$ with $0 \leq x \leq 0.2$ have been synthesized with a weight of about 30 g each. In contrast to solid-state-reactions, the sol-gel-method should create a better homogeneity since the starting materials are mixed on a molecular scale. The purpose of the La is to introduce an internal chemical pressure to rise the critical temperature T-c since external pressure shows no effects in this direction. The tetravalent Ce^{4+} introduces electrons in the CuO_2-planes. Elastic neutron-scattering has been used to investigate the structural parameters. Since Ce has a smaller ionic radius than La and Nd (lanthanide-contraction) it is expected that the lattice parameters a and c of the tetragonal unit cell (space group I4/MMM) are decreasing functions of the Ce-concentration x. Surprisingly this behavior is only found for c. Using inelastic neutron-scattering the crystalline field of $R_{1-x}Ce_xLaCuO_4$ (R = Nd, Pr) has been investigated to obtain information on the local electronic structure in the CuO_2-planes. The compounds containing Nd (x = 0, 0.12) are non-superconducting and show indications towards orthorhombic distortions. The superconducting substances with Pr have been prepared by the Spanish group around X. Obradors and are gratefully placed to my disposal. The superconducting doping range is at least between $0.06 \leq x \leq 0.18$. The crystalline field of the two investigated samples (x=0.06, 0.12) clearly shows a substructure which can be interpreted in terms of different surroundings for Pr. (author) figs., tabs., 24 refs.

16997 (BNL–61149, pp. 145-149) **Studies on the effect of window deformation on the scattering and energy profiles of the beam: Potential effects contributing to target mass.** Brookhaven National Lab., Upton, NY (United States). 1994. DOE Contract AC02-76CH00016. Grant NS-15380. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

Recently, the authors installed a preformed 18.5 miL thick aluminum window, possessing a 5 mm hemispherical deformation, onto a 77 mL volume conical target, but with the deformation placed concave into the target. This was done because pressure and beam induced deformation of our flat aluminum windows would cause them to bow outward beyond the helium cooling axis, which eventually resulted in window failure. It was thought that placing a preformed window in a concave geometry would provide additional radial strength to minimize further deformation, and also optimum window cooling thus increasing window lifetime. The windows were fabricated from 6061 aluminum alloy. The alloy exists in a T_6 state of hardness (the highest level), but can be converted to a T_0 workable state through heating of the alloy for several hours at 500°C. Once in this state, the windows can be deformed over a mandrel with little or no stress added to the surface structure. The alloy automatically reverts back to its original state of hardness over a 48 hour period. In-direct observations made on [^{11}C]cocaine specific activity suggested that target mass contributions were somewhat reduced with the window placed in a concave configuration. This has not been verified directly through CO_2 target mass measurements. Even so, this peaked interest in what effect window geometry might have on the scattering and energy profiles of the proton beam. These aspects could have significant effects on target surface contributions to mass.

16998 (CEA-CONF–11875) **Behaviour of thin films and bulk oxides under microbeam irradiation.** Trocellier, P. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Recherche sur l'Etat Condense, les Atomes et les Molecules. 1994. 2p. (CONF-941010–: 4. international conference on nuclear microprobe technology and applications, Shanghai (China), 10-14 Oct 1994). Order Number DE95627459. Source: OSTI; NTIS (US Sales Only); INIS.

Thin films of metal (gold, titanium and chromium) or binary compounds (hydrides and oxides) both with bulk oxides were submitted to various irradiation runs, using 900 keV to 2.5 MeV protons, deuterons and helium-4 microbeams (10 to 100 μm^2). μRBS, μPIXE and μNRA have been used to determine the surface composition of the irradiated samples versus ion nature and ion dose. The shrinking of thin metallic films within the irradiated area and the elemental transport to the neighbouring zones is clearly shown. The high resistance to irradiation effects of refractory oxides like Ta205 or W03 is also outlined. Moreover, the sputtering coefficients of transition metals have been experimentally measured. The comparison of these data with predicted values from classical models indicates that surface contamination effect may play an important role in the sputtering phenomenon. (author).

16999 (INIS-JP–028, pp. 9-11) **Angular dependence of the neutral fraction of medium-energy hydrogen emerging from $NiSi_2(111)$.** Ohdaira, Toshiyuki (Kyoto Univ. (Japan). Faculty of Engineering); Takashima, Atsushi; Koya, Tsuyoshi; Hatano, Kenjiro; Itoh, Akio; Imanishi, Nobutsugu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

A strong angular dependence has been found first in the neutral fraction of medium-energy hydrogen emerging from $NiSi_2(111)$. The angular dependence can be explained well in terms of the atomic arrangement and composition of $NiSi_2(111)$ surface and impact-parameter (trajectory) dependent charge-exchange processes at a few atomic layers beneath the exit surface. (author).

17000 (INIS-JP–028, pp. 12-14) **Secondary ion emission bombarded with MeV heavy ion.** Takakuwa, Kei (Kyoto Univ. (Japan). Faculty of Engineering); Umezawa, Masumi; Kyoh, Sui-Gen; Itoh, Akio; Imanisi, Nobutugu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

The intensity of secondary cluster ion emission from SiO_2 bombarded with MeV energy heavy ions has been measured. We examined the formation processes of secondary cluster ions by measuring the dependence of secondary ion yield on stopping power. The $Si_n O_m^+$ (m=2n-2, 2n-1, 2n), ions have the correlations with electronic-stopping power in the momentum transfer processes, respectively. (author).

17001 (INIS-JP–028, pp. 21-22) **Production of multiply charged Be ions by bombarding heavy projectiles.** Kyoh, Sui-Gen (Kyoto Univ. (Japan). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Production of multiply charged Be ions has been tried by bombarding heavy projectiles onto a solid beryllium target at a projectile energy range of MeV. (author).

17002 (INIS-JP–028, pp. 23-25) **Annealing behaviour of hydrogen in aluminium implanted silicon.** Yoshida, Hisashi (Kyoto Univ. (Japan). Faculty of Engineering); Nakatani, Norikazu; Ogura, Masahiko; Imanishi, Nobutsugu; Itoh, Akio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

An influence of silicon implantation on annealing behaviour of hydrogen in aluminium was studied. The temperature of a specimen was ramped upward at a rate of 1K/min. ERD was used to observe the depth profile of hydrogen. In the sample implanted silicon, hydrogen concentration in the near-surface region increased with increasing temperature. (author).

17003 (INIS-JP–028, pp. 94-96) **Charge-state distribution of MeV He ions scattered from the surface atoms.** Kimura, Kenji (Kyoto Univ. (Japan). Faculty of Engineering); Ohtsuka, Hisashi; Mannami, Michihiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University*. Order Number DE95709897. Source: OSTI; NTIS; INIS.

The charge-state distribution of 500-keV He ions scattered from a SnTe (001) surface has been investigated using a new technique of high-resolution high-energy ion scattering spectroscopy. The observed charge-state distribution of ions scattered from the topmost atomic layer coincides with that of ions scattered from the subsurface region and does not depend on the incident charge state but depends on the exit angle. The observed exit-angle dependence is explained by a model which includes the charge-exchange process with the valence electrons in the tail of the electron distribution at the surface. (author).

17004 (INIS-JP–028, pp. 97-99) **Dissociation of MeV HeH^+ ions at glancing angle incidence on a clean surface of single crystal.** Susuki, Yasufumi (Kyoto Univ. (Japan). Faculty of Engineering); Ito, Takashi; Kimura, Kenji; Mannami, Michihiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University*. Order Number DE95709897. Source: OSTI; NTIS; INIS.

Angular and energy distributions of scattered fragments have been measured at glancing angle incidence of MeV HeH^+ ions on a clean (001) surface of SnTe crystal. The distributions show that the internuclear vectors between fragments tend to align with the beam direction. The alignment is explained in terms of a surface wake potential due to dynamic response of surface electrons to the charges of fragments. In addition, internal energy released at dissociation of the ion is derived. The energy is approximately a half of the Coulomb potential energy of He^{2+} and H^+ at the ground state of molecular ion. (author).

17005 (INIS-JP–028, pp. 100-102) **High energy ion beam mixing.** Ektessabi, A.M. (Kyoto Univ. (Japan). Faculty of Engineering). Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University*. Order Number DE95709897. Source: OSTI; NTIS; INIS.

Experimental investigations have been made on the parameters which can be used to control the mixing profiles, and the width of intermixed layers in film-substrate systems being irradiated by high energy heavy ion beams. The samples were irradiated by ion beams of Au, Cu, and Si with energies of 1.5 to 3 MeV. Typical examples of the RBS spectra are presented and discussions are made on the extent of contribution of binary collisions on the interfacial mixing. The experimental and simulation results show that the interfacial mixing is dominated by the binary collisions. (author).

17006 (INIS-JP–028, pp. 106-108) **Epitaxial growth of Al films on sapphire substrates.** Akedo, K. (Kyoto Univ. (Japan). Faculty of Engineering); Hirai, N.; Takaoka, G.H.; Yamada, Isao. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University*. Order Number DE95709897. Source: OSTI; NTIS; INIS.

In order to obtain epitaxial Al-Al_2O_3 multi-layer devices, it is necessary to deposit epitaxially Al on Al_2O_3 and Al_2O_3 on Al. We have already obtained an epitaxial Al_2O_3 film on Al/Si (111). In this paper, we have grown Al films on sapphire (0001) substrates, and investigated the crystallinity by using RBS, RHEED, and X-ray diffraction measurements. (author).

17007 (INIS-JP–028, pp. 109-111) **Surface modification of bioactive ceramic by the Zr ion implantation.** Ishimoto, H. (Kyoto Univ. (Japan). Faculty of Engineering); Takaoka, G.H.; Swanson, M.; Yamada, Isao. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University*. Order Number DE95709897. Source: OSTI; NTIS; INIS.

Glass ceramics (A-W) were implanted with 200 keV Zr ions at doses of 1 x 10^{15} to 2.5 x 10^{15} ions/cm^2. The mechanical strength of Zr implanted ceramics was measured for the case of one-faced and four-faced implantation, and it was 140 - 200 MPa depending on the loading rate. Although the tensile strength has much influence on the critical value of the fracture strength, the A-W ceramics implanted on four faces showed higher fracture strength due to the prevention of the crack from proceeding than that on one faced implantation. (author).

17008 (INIS-JP–029, pp. 8-10) **Neutralization of intermediate-velocity Li emerging from Cs- and O-covered Si(100) surface.** Hadano, Ken-jiro (Kyoto Univ. (Japan). Faculty of Engineering); Ohdaira, Toshiyuki; Imai, Makoto; Itoh, Akio; Imanishi, Nobutsugu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993*. Order Number DE95709896. Source: OSTI; NTIS; INIS.

Neutral fractions have been measured for intermediate-velocity ($v \approx 0.6\text{-}2v_0$, v_0: Bohr velocity 2.2x10^8 cm/s) Li emerging from Si(100) surface which Cs and O atoms were adsorbed to modify the electronic states of the surface. Contrary to the interpretation based on the resonant-neutralization model, the neutral fraction did not always correlate with the work function of the surface. The neutral fraction at low- ($v < v_0$) and high- ($v > v_0$) velocity region showed distinctly different behaviors. (author).

17009 (INIS-JP–029, pp. 11-13) **Current dependence of secondary-ion yield for SiO_2 bombarded with MeV heavy ions.** Umezawa, Masumi (Kyoto Univ. (Japan). Faculty of Engineering); Takakuwa, Kei; Imai, Makoto; Itoh, Akio; Imanishi, Nobutsugu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993*. Order Number DE95709896. Source: OSTI; NTIS; INIS.

Secondary ion yields for SiO_2 target bombarded by 1.0-6.6 MeV Si^{q+} were measured as a function of incident-beam current (i_p) in a range 0.05-200pnA. Dependence of the yields on the stopping power was also obtained for some cluster ions. Secondary cluster ions are formed outside the target. (author).

17010 (INIS-JP–029, pp. 14-16) **Production of low energy beryllium ions utilizing a heavy ion sputtering ion source and its application to electron transfer collisions.** Horigami, H. (Kyoto Univ. (Japan). Faculty of Engineering); Bitoh, Y.; Awata, T.; Yoshida, K.; Imai, M.; Itoh, A.; Imanishi, N.; Saito, M.; Haruyama, Y. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993*. Order Number DE95709896. Source: OSTI; NTIS; INIS.

The First experimental studies have been performed on electron transfer collisions of low energy beryllium ions with various hydrocarbon molecules. To obtain sufficient beam intensity of beryllium ions, a Heavy-Ion-Sputtering-Ion-Source has been newly developed. Single and double electron capture cross sections have been successfully measured for Be^{q+} (q=1,2) ions in the energy range of (8-16)q keV. (author).

17011 (INIS-JP–029, pp. 20-22) **The annealing behaviour of hydrogen implanted into Al metal and Al-Si alloy.** Ogura, Masahiko (Kyoto Univ. (Japan). Faculty of Engineering); Nakatani, Norikazu; Sohda, Yuh-ichi; Imai, Makoto; Itoh, Akio; Imanishi, Nobutsugu. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993*. Order Number DE95709896. Source: OSTI; NTIS; INIS.

In the present experiment, we have investigated how defects and elements as additive play a role as trap site by observing the

annealing behaviour of hydrogen implanted into Al and Al-Si alloy. It was found that hydrogen is trapped as molecules in grain boundaries of Si in Al. (author).

17012 (INIS-JP–029, pp. 28-30) **Observation of lattice defect in semiconductors. Examination of the accuracy of minimum yield measurement in the channeling method. 2.** Kimura, Itsuro (Kyoto Univ. (Japan). Faculty of Engineering); Kanno, Ikuo; Kanazawa, Satoshi; Inbe, Takashi; Mikawa, Takumi; Ishihara, Shinji. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

To observe the neutron irradiation effect of silicon by the He^{2+} ion channeling method with Experimental System for Ion Beam Analysis. Kyoto University, its accuracy has been experimentally examined. And it has been shown that (1) considerably large change (10-20%) is observed for RBS yield at different rotation angles and (2) the He^{2+} beam current depend on the resistivity of target materials. (author).

17013 (INIS-JP–029, pp. 52-53) **Ion induced damage production and recovery in silicon.** Ito, H. (Kyoto Univ. (Japan). Faculty of Engineering); Shin, K.; Takagi, I.; Yoshida, K. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

We measured and analyzed defect production and recovery in single crystal silicon. Samples were bombarded by 800 keV O^+ ion with the dose from $2x10^{14}$ up to $2x10^{16}$ cm^{-2}. After irradiation we observed defects induced by ion bombardment by the channeling backscattering method. By the 30min annealing at 800degC of the sample, defects annihilated partly and some dislocations were formed in the crystal. We tried to estimate the quantity of them. (author).

17014 (INIS-JP–029, pp. 89-91) **Dissociative scattering of MeV HeH^+ ions at glancing angle incidence on a crystal surface.** Susuki, Yasufumi (Kyoto Univ. (Japan). Faculty of Engineering); Ito, Takashi; Kimura, Kenji; Mannami, Michi-hiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Energy spectra of specularly reflected fragments have been measured, when 0.8 - 2.5 MeV HeH^+ ions are incident on a clean (001) surface of SnTe crystal at glancing angles. The energy spectra show that the final energy released upon the dissociation of HeH^+ agrees well with that calculated from Coulomb repulsion between the He^+ and H^+ fragments in a free space, while most of the outgoing fragments are He^{2+} and H^+. The energy spectra of fragments are reproduced by a computer simulation. The cross section for dissociation of HeH^+ ions in collision with electrons at the surface is estimated to be of the order of 10^{-16} cm^2. (author).

17015 (INIS-JP–029, pp. 98-100) **Contribution of inner shell electrons to position-dependent stopping powers of a crystal surface.** Narumi, Kazumasa (Kyoto Univ. (Japan). Faculty of Engineering); Fujii, Yoshikazu; Kishine, Keiji; Kurakake, Hiroshi; Kimura, Kenji; Mannami, Michi-hiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Position-dependent stopping powers of the (001) surface of SnTe single crystal for specularly reflected 15 - 200 keV H^+ ions are studied. The position dependence of the experimental stopping powers varies with the energy of ions. From the comparison with the theoretical stopping powers based on both the single ion-electron collision and the collective excitation of the valence electrons, it is concluded that the observed change in the position-dependent stopping powers with energy of H^+ is due to the variation of contribution of inner shell electrons to stopping. (author).

17016 (INIS-JP–029, pp. 101-103) **Preparation of thin oxide films using ion beam mixing effect.** Ektessabi, A.M. (Kyoto Univ. (Japan). Faculty of Engineering). Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

In this paper, the experimental results of sputter deposition of thin oxide films of titanium and aluminum are presented and the effects of simultaneous irradiation of thin films during growth by an oxygen ion beam are discussed. The films are deposited on various substrates such as Ti, Si, SUS, and quartz using argon ion beam for sputtering, and oxygen ion beam for producing the mixing effect and control of the stoichiometry of the oxides. RBS Measurement results related to the micromorphology of the interface, and film composition are presented. Experimental results suggest that the ion mixing effect in the process of ion beam assisted sputter deposition strongly influences the adhesion, and stoichiometry of the films. (author).

17017 (INIS-JP–029, pp. 110-112) **Irradiation-effects of CO_2 cluster ion beams on solid surface.** Yamaguchi, T. (Kyoto Univ. (Japan). Faculty of Engineering); Toyoda, N.; Takaoka, G.H.; Yamada, I. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Gas-cluster ion beams can be applied to new surface modification techniques such as surface cleaning, low damage sputtering and shallow junction formation. The effects of energetic CO_2 cluster impacts on solid surface were studied for cluster energies of 10keV. Irradiation effects were studied by AFM and RBS. A very flat Pt/Si surface was obtained after irradiation with CO_2 clusters, which indicates lateral sputtering effect at the surface. CO_2 cluster ion irradiation on Cu/Si produced lower damage than CO_2 monomer ion irradiation. (author).

17018 (INIS-JP–029, pp. 116-118) **Surface modification of silica glasses for the radiotherapy by using phosphorus ion implantation.** Takaoka, G.H. (Kyoto Univ. (Japan). Faculty of Engineering); Yamada, Isao; Kawashita, Masaichi; Miyaji, Fumiaki; Kokubo, Tadashi. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

A pure silica glass was implanted with phosphorus ions by a dose of 2×10^{17} cm^{-2} at 20 kev, and subjected to heat-treatments up to 900 degC. They were soaked in distilled water at 95 degC for 7 days. The phosphorus ion was completely dissolved into the water from the as-implanted glass. The dissolution was, however, much suppressed by the heat-treatment of the glass. The RBS measurement showed that an appreciable amount of phosphorus remained in the glass heat-treated at 900 degC even after the soak in the hot water. These results indicate that the phosphorus implanted glass is a promising material for the radiotherapy. (author).

17019 (JHP-Suppl–15, pp. 215-219) **Hyperfine interactions of short-lived beta emitter ^{12}B implanted in ferromagnetic Co.** Yanagisawa, T. (Osaka Univ., Toyonaka (Japan). Dept. of Physics); Momota, S.; Tanaka, M.B. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jun 1994. (In Japanese). (CONF-9312103–: Symposium on the science of short-lived RI beam 1993, Tanashi (Japan), 16-18 Dec 1993). In *Proceeding of the symposium on the science of short-lived RI beam 1993.* 336p. Order Number DE95747917. Source: OSTI; NTIS; INIS.

Hyperfine interactions of short-lived β emitter ^{12}B implanted in hcp Co and single crystal bcc Co/Fe multilayers were investigated by use of the asymmetric β-decay and NMR detection. In hcp Co, three kinds of hyperfine fields were observed as $B_{hf}(S1)$=-4.3(1)kG, $B_{hf}(S2)$=-24.2(6)kG, and $B_{hf}(S3)$=-27.5(2)kG at 330K, and the spin-lattice relaxation time T_1 was studied at the three fields, respectively. It is estimated that the observed widths of the resonances were resulted from the atomic dipolar fields. In bcc Co/Fe multilayers, two kinds of internal fields were observed as B_{int}=-0.1(1)kG and B_{int}=+2.42(9)kG at 330K. It is indicated that the lower field was attributed to that in Fe, and the higher one was to bcc

Co. The spin-lattice relaxation time T_1 at the two respective fields were also studied. (author).

Submitted to the 17-th International Conference 'Nuclear Tracks in Solids', Dubna, 1994.

The surfaces of boron doped synthetic and natural diamonds have been investigated by scanning tunneling (STM) and electronic microscopy (SEM) before and after irradiation with ^{40} Ar (25 MeV), ^{84} Kr (210 MeV), ^{129} Xe (124 MeV) ions. The structures observed (STM) after irradiation showed craters ranging from 3 nm to 20 nm in diameters, which are deduced to be single ion tracks and multiple hits of ions at the nearest positions of the surface. In the case of argon ion irradiation the surface was very amorphous, but after xenon irradiation one could see parts of surface without amorphism. It can be explained by the influence of high inelastic energy losses. 20 refs., 5 figs.

17022 (NIFS-DATA–22) **Simulation calculations of physical sputtering and reflection coefficient of plasma-irradiated carbon surface.** Kawamura, T.; Ono, T.; Yamamura, Y. National Inst. for Fusion Science, Nagoya (Japan). Aug 1994. 16p. Order Number DE95768190. Source: OSTI; NTIS; INIS.

Physical sputtering yields from the carbon surface irradiated by the boundary plasma are obtained with the use of a Monte Carlo simulation code ACAT. The yields are calculated for many random initial energy and angle values of incident protons or deuterons with a Maxwellian velocity distribution, and then averaged. Here the temperature of the boundary plasma, the sheath potential and the angle δ between the magnetic field line and the surface normal are taken into account. A new fitting formula for an arrangement of the numerical data of sputtering yield is introduced, in which six fitting parameters are determined from the numerical results and listed. These results provide a way to estimate the erosion of carbon materials irradiated by boundary plasma. The particle reflection coefficients for deuterons and their neutrals from a carbon surface are also calculated by the same code and presented together with, for comparison, that for the case of monoenergetic normal incidence. (author).

6654 Quantum Physics Aspects of Condensed Matter

17023 (IC–95/40) **Breakdown of quasiparticle picture in the low-density limit of the 1D Hubbard model.** Qin Shaojin (Academia Sinica, Beijing, BJ (China). Inst. of Theoretical Physics); Qian Tiezheng; Su Zhaobin; Yu Lu. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 14p. Order Number DE95629161. Source: OSTI; NTIS (US Sales Only); INIS.

Using the finite-size scaling of results obtained by exact diagonalization, we study the low-density limit of the one-dimensional Hubbard model. Calculating the quasiparticle weight, we demonstrate that for a given particle number N and system size L, there always exists a crossover point U_c separating the Fermi-liquid ($U < U_c$) and non-Fermi-liquid ($U > U_c$) regimes (U is the Hubbard repulsion). We find that for a fixed N, U_c is inversely proportional to L, keeping U_cL/t constant (with t as the hopping integral), as L is large enough. It follows that in the low-density (in fact vanishing density) limit $L \to \infty$, $U_c \to 0$, so the system is always in non-Fermi-liquid regime as long as $U > 0$. We show that our numerical results are consistent with the Bethe ansatz solution. (author). 11 refs, 3 figs.

17024 (ANL/ET/CP–84477) **Performance evaluation of high-temperature superconducting current leads for micro-SMES systems.** Niemann, R.C. (Argonne National Lab., IL (United States)); Cha, Y.S.; Hull, J.R.; Buckles, W.E.; Weber, B.R.; Yang, S.T. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941013–32: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95005843. Source: OSTI; NTIS; GPO Dep.

As part of the U.S. Department of Energy's Superconductivity Technology Program, Argonne National Laboratory and Superconductivity, Inc., are developing high-temperature superconductor (HTS) current leads for application to micro-SMES systems. Two 1500-A HTS leads have been designed and constructed. A component performance evaluation program was conducted to confirm performance predictions and/or to qualify the design features for construction. The evaluations included HTS characteristics, demountable electrical connections, and heat intercept effectiveness. The performance of current lead assemblies is being evaluated in a zero-magnetic-field test program that included assembly procedures, tooling, and quality assurance; thermal and electrical performance; and flow and mechanical characteristics. The leads were installed in a liquid helium test cryostat and connected at their cold ends by a current jumper. The leads were heat intercepted with a cryocooler.

17025 (BNL–61242) **Effects of temperature ramp rate during heat treatment on hysteresis loss and critical current density of internal tin processed wires.** Suenaga, M.; Sabatini, R.L. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9503127–1: 9. US/Japan workshop on high-field superconducting materials, Kyoto (Japan), 11-16 Mar 1995). Order Number DE95009551. Source: OSTI; NTIS; INIS; GPO Dep.

It has been shown that temperature ramp rates utilized in heat treatment schedules for internal tin processed Nb_3Sn wires substantially influence both hysteresis loss and critical current density J_c of the wires, i.e. a slow ramp rate (e.g. 6°C/h) favors a higher J_c while a fast ramp (e.g. 60°C/h)results in a low hysteresis loss of the wire.

We consider a solvable model of a one dimensional electron gas interacting with an array of dynamical scattering centers, whose state is specified by a pseudospin variable. In the dilute limit, for frequencies w and temperatures T below the single-center Kondo scale but above a coherence scale δ, the physics is governed by the fixed point of the single-impurity two-channel Kondo problem. In that region, the physical properties are governed by composite (or odd-frequency) pairing fluctuations and they are reminiscent of

the normal state of high temperature superconductors. As ω and T $\rightarrow$ 0, three susceptibilities are equally divergent: (1) conventional, spin-singlet even-parity pairing (2) composite spin-singlet odd-parity 77-pairing and (3) odd parity pseudospin.

17027 (CONF-9407153–Vol.1, pp. 35-44) **Superconducting technology: The impact of oxide superconductors.** Blaugher, R.D. (National Renewable Energy Lab., Golden, CO (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The application of superconductors to a variety of power systems and electronic applications has been pursued over the past twenty years. High-field, high-current type II superconductors such as NbTi and Nb3Sn were successfully applied to a wide range of large-scale applications – from bubble chambers to levitated trains. The discovery of the Josephson junction and its associated fast switching behavior was applied to sensors, computer logic and a wide range of signal processing applications. It is fair to assume that all of these previous superconducting related applications were compromised by the necessity for liquid helium cooling. The discovery of the high-temperature oxide superconductors has renewed interest and buoyed the prospects for the superconducting technology. These expectations can only be realized if oxide based performance is achieved with mechanical and electrical characteristics which are functionally equivalent to the conventional superconductors. This talk will review the past and present status for the superconducting technology with emphasis on power system related applications. The major problems that must be addressed to successfully integrate these new oxide materials will be discussed. Finally the prospects for the superconducting technology using oxide superconductors will be summarized.

Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

A review of the High Temperature Superconducting (HTS) motor development program at Reliance Electric is presented. The project was initiated in 1987 by EPRI to investigate the use of high temperature superconducting materials in electric motors. Liquid nitrogen was proposed as the HTS winding coolant. The ultimate goal, motivation, motor type and HTS wire requirements as well as the program milestones are outlined. It was concluded that the HTS motor development has paralleled wire development; progress continues toward the goal of large horsepower HTS motors for commercial applications; the team is well on the way toward completing the design of a 125 hp, 1800 rpm motor with HTS coils cooled to 20 to 40 K; and the program is a vital step in the development of HTS motors.

17029 (CONF-9407153–Vol.1, pp. 61-74) **A 100 MVA generator utilizing high-temperature superconducting windings – design assessment and component development.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The design and component development of a 100 MVA generator using high temperature superconducting windings are reviewed. The worldwide potential superconducting generator market over the next 10 years is forecasted to be $20 to 30 billion. Task 1 of the generator development consists of the design, economic evaluation, and interactions with the grid. Task 2 of the program consists of improving BSCCO wire, use of alternate materials, and wire and coil fabrication. Tasks 1 and 2 of the program are outlined.

17030 (CONF-9407153–Vol.1, pp. 104-124) **Collaborative development of Tl(1223) open-system tape conductors.** Tkaczyk, J.E. (General Electric Corporate R&D, Schenectady, NY (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

Steps in the collaborative development of Tl(1223) open system tape conductors for superconducting magnets and generators are outlined. These steps are: refrigerated magnet applications, tape requirements, conductor development, critical current versus thickness, substrate comparison, process control and continuous processing, flow system, high Jc sample from flow reactor, pull through apparatus, rapid versus two-step process, transport mechanism, reduction anneals, wire development advances 1994, and milestones 94-95.

17031 (CONF-9407153–Vol.1, pp. 126-161) **HTS wire development at Intermagnetic General Corporation.** Haldar, P. (Intermagnetics General Corp., Latham, NY (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The HTS wire development program at Intermagnetics General Corporation is outlined. Technical achievements in the Bi-2223, Tl-1223 and Tl-based conductor program are summarized. Long lengths of Tl-based HTS tapes with uniform transport properties have been fabricated. Multifilament samples of Tl-based HTS tapes have been fabricated for the first time. Optimization of thermomechanical processing is ongoing and weak links is still a major problem in P-I-T tapes. Future work is summarized.

17032 (CONF-9407153–Vol.1, pp. 162-190) **Development of BSCCO-2212/Ag composite conductors.** Marken, K.R. (Oxford Instruments Inc., Carteret, NJ (United States)); Dai, W.; Hong, S. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The development of BSCCO-2212/Ag composite conductors is outlined. Topics discussed include: advantages of dip coating, BSCCO-2212 conductor configurations, powder-in-tube status, overview of OST CRADA's with DOE, heat treatment optimization studies, thermal analysis of powder and conductor, Ag alloy and composite development, and the reason Jc increases with longer length. It is concluded that steady advances are being made in understanding some problems for Jc, powder-in-tube processing, and in the dip coating process.

17033 (CONF-9407153–Vol.1, pp. 193-206) **Introduction to ANL's effort in HTSc wire development.** Balachandran, U. (Argonne National Lab., IL (United States)); Crabtree, G.W.; Dorris, S.E.; Ellingson, W.A.; Goretta, K.C.; Gray, K.E.; Kupperman, D.S.; Kampwirth, R.T.; Lanagan, M.T.; Maroni, V.A. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to develop, in the shortest possible time, methods to fabricate and use reliable HTS conductors in commercial applications for generation, transmission, and storage of electrical energy. The multiyear, experimental program focuses on improvement of materials properties, development of fabrication methods, and design and testing of HTS components and systems, with emphasis placed on wire and coil production. Collaborations with industry and academia are integral to the effort.

17034 (CONF-9407153–Vol.1, pp. 239-270) **Development of Tl-1223 conductors for high-temperature, high-field applications.** Gray, K.E. (Argonne National Lab., IL (United States)); Miller, D.J.; Lanagan, M.T.; Kampwirth, R.T.; Hettinger, J.D.; Hu, J.G.; Dorris, S.E.; Kupperman, D.S.; Goretta, K.C. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The goal of this part of the Argonne program is to develop a useful conductor for high-temperature, high-field applications, with Tl-1223 being the most promising candidate at present. The rationale is the improved flux pinning properties of Tl-1223 at 77 K compared to Bi-2223, first shown by us, and, the potential for improved intergranular coupling, first demonstrated by General Electric. Our research progress to date indicates that good phase purity and grain alignment are necessary, but not sufficient to obtaining the highest J_c in Tl-1223: it also is necessary to avoid significant intergranular weak links, and processing in presence of a transient liquid phase seems to be a very effective way to do this. Our mission/objective is to identify synthesis and processing procedures which will overcome the intergranular weak link problem in Tl-1223. Our approach is to concentrate on finding and using transient-liquid phases at the crucial step in processing to assist in grain orientation and improved intergranular connectivity, while preserving reasonable phase purity. This program includes various powder-in-tube (PIT) configurations and thick (20-50 micron) coatings, and much of it involves research agreements with General Electric, Intermagnetics General, SUNY-Buffalo and the Thallium Working Group. We also evaluate and quantify weak-links using TEM and transport measurements.

17035 (CONF-9407153–Vol.1, pp. 271-291) **Relationships between microstructure and critical current: Reaction induced texture and magneto-optic measurements.** Maroni, V.A. (Argonne National Lab., IL (United States)); Merchant, N.; Luo, J.; Welp, U.; Crabtree, G.W. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. DOE Contract W-31109-ENG-38. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The relationship between microstructure and critical current of superconducting wires is outlined. The following topics are discussed: reaction induced texture and magneto-optic imaging of Bi-2223/Ag composite conductors. Technical accomplishments, future work, and EERE sponsored activities in the ANL Chemical Technology Division are outlined.

17036 (CONF-9407153–Vol.1, pp. 293-329) **Bulk conductor development: Characterization and fabrication.** Suenaga, M. (Brookhaven National Lab., Upton, NY (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The characterization and fabrication of bulk superconductors for the electric power industry are outlined. The following topics are discussed: practical conductor development for electric power systems using high-T_c oxides, industrial and university collaborators, characterization capabilities in superconducting properties, dc transport dissipation mechanisms, critical currents at elevated temperatures, critical current density, tensile strain versus critical currents, fabrication of Bi 2223/Ag conductors, and powders used in the study.

17037 (CONF-9407153–Vol.1, pp. 331-365) **HTS powder synthesis and wire sintering.** Peterson, D. (Los Alamos National Lab., NM (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

Successful processing of HTS wires that exhibit superconducting properties and lengths appropriate for applications requires thoroughly understanding and carefully controlling experimental parameters. Initial important processing considerations are the quality and nature of the powder used to produce the superconductor within the wire composite. Following fabrication of the wire, sintering conditions must be chosen based on a knowledge of the phase behavior of the associated materials. HTS wire studies with our industrial partners have involved Bi-2212, Bi-2223, and Tl-1223 based systems. The goals of this project's efforts in these collaborations have been directed towards: (1) Establishing procedures for HTS powder syntheses that produce superconductors with optimal properties; (2) Studying conditions for HTS wire sintering that produce high current densities appropriate for conductor applications. The Los Alamos project involves 6 staff, 3 technicians, and 4 postdoctoral students.

17038 (CONF-9407153–Vol.1, pp. 370-404) **Deformation processing of HTS wire.** Bingert, J. (Los Alamos National Lab., NM (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

Methods to understand, control, and optimize deformation processing of HTS wire are outlined. Topics discussed include: technical progress, deformation processing effects on HTS - core uniformity in composite tapes, effects of rolling on tapes, deformation process modeling, channel die powder compaction stress-strain data, microhardness versus rolling reduction, minimum bifurcation strain versus material state, roll gap geometries for large versus small rolls, interactions, hydrostatic extrusion, and tensile properties.

17039 (CONF-9407153–Vol.1, pp. 405-440) **Critical currents and characterization of HTS conductors.** Maley, M. (Los Alamos National Lab., NM (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

At present the performance of HTS conductors is limited by a variety of material and physical problems that must be overcome in order for the full potential of HTS-based technology to be realized. The impressive advances in achieving high critical current densities, J_c's, in BSCCO conductors that can be manufactured in long continuous lengths have come from significant reduction of weak intergranular connections through improved control of microstructure. The rapid decline in J_c with magnetic field at temperatures above 25K has been associated with weak pinning of vortices related to the extreme intrinsic anisotropy of the BSCCO compounds. The objectives of this project are: (1) To investigate the transport and magnetic properties of HTS conductors to provide an understanding of the mechanisms that limit current flow in these materials at high temperatures in magnetic fields of technical interest; (2) To suggest and evaluate new methods of improving intergranular connectivity and flux pinning; and (3) To develop new experimental capabilities to provide a better characterization of the performance of HTS conductors and devices.

17040 (CONF-9407153–Vol.1, pp. 482-516) **Spray pyrolysis and thermal processing.** Parilla, P.A. (National Renewable Energy Lab., Golden, CO (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

Spray pyrolysis and thermal processing of superconducting wire are outlined. Topics discussed include: spray pyrolysis, 2-zone processing, PBSCCO precursor on $LaAlO_3$, GE verification study, verification results, physical properties of lattice - matched metal oxide materials, and thick film processing, future plans, major results, and program plans for FY95 are summarized.

17041 (CONF-9407153–Vol.1, pp. 518-570) **Critical currents and microstructure.** Kroeger, D.M. (Oak Ridge National Lab., TN (United States)); Christen, D.K. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

This is a comprehensive and highly collaborative project to determine and control the microstructural characteristics which lead to high critical current densities ($J_c(H)$) in polycrystalline conductors. Issues related to minimization of weak link behavior, optimization of flux pinning, and power dissipation in the resistive state above J_c are addressed. The specific objectives are: (1) to improve the effectiveness of processing for increasing $J_c(H)$ by (a) defining the paths through which long-range conduction occurs in high J_c polycrystalline conductors and prototype samples, and (b) developing methods and criteria by which to evaluate microstructures for use in conductor processing studies; (2) to increase and optimize the flux pinning by the controlled introduction of defect structures and by post-formation thermal processing; and (3) to determine the characteristics of various conductor forms for potential operation in the dissipative state above the critical current. All parts of this project are carried out in close collaboration with an industrial partner. Specimens examined are provided by industry and are drawn from current wire development programs.

17042 (CONF-9407153–Vol.1, pp. 571-608) **Thallium conductor development.** Goyal, A. (Oak Ridge National Lab., TN (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

This is a comprehensive and highly collaborative project aimed at conducting processing studies with the objective of fabricating Tl-1223 powder-in-tube (PIT) conductors as well as thick film wires with superior properties. The specific objectives are to: (1) determine aerosol process parameters and post heat-treatment conditions for forming anisotropic particles with varying phase assemblages; (2) optimize the initial deformation sequence and subsequent heat-treatment/deformation cycles to obtain well-linked PIT Tl-1223 wires; (3) conduct microstructural examination of quenched Tl-1223 thick films (supplied by GE) from various stages into the two-zone thallination procedure to determine the phase evolution and development of the colony microstructure during thallination and to determine the effects of various processing parameters on microstructure. Such a study will be useful in minimizing the thallination time, as needed for a continuous, pull-through process for making wire; and (4) fabricate Tl-1223 thick films on compatible ceramic as well as metallic substrates by a variety of techniques including: (a) spray pyrolysis, (b) painting an ink of aerosol-derived powder with an organic vehicle, and (c) sol gel.

17043 (CONF-9407153–Vol.1, pp. 609-650) **Thermomechanical processing of BSCCO conductors.** Kroeger, D.M. (Oak Ridge National Lab., TN (United States)); Sikka, V.K. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The ORNL BSCCO conductor development program involves collaborations with four companies and one university. The objectives of the industrial collaborations are to: (a) to determine fabrication routes for powder-in-tube (PIT) conductor which optimize the dimensional stability of the core, the Ag/superconductor interface and texture, (b) to determine mechanical properties of individual phases present during PIT fabrication, and (c) to contribute to the ASC initiative to develop processes for use of very fine and homogeneous powders in multifilament conductors; develop chemical barrier layers for strong metal substrates for Bi-2212 conductors; develop chemically compatible strengthened substrates for use in Bi-2212 conductors fabricated by dip-coating, and to aid in determining sources of J_c variability in wires prepared by Oxford; and develop thermal and mechanical processes for a continuous tubular wire fabrication method as an alternative to PIT. ORNL provides partial support for a student at the University of Wisconsin to evaluate the effects of dopants on aerosol powders for wires.

17044 (CONF-9407153–Vol.1, pp. 652-670) **Material synthesis and processing in the Tl-1223 system.** Voigt, J. (Sandia National Labs., Albuquerque, NM (United States)); Venturini, E.L.; Roth, E.P.; Aselage, T.L.; Lockwood, S.J. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

Materials synthesis and processing in the Tl-1223 system are outlined. Topics discussed include: role of materials development in collaborations, effect of stoichiometry in the TL-1223 system, stoichiometries investigated, Ba-free composition has no melt events below 960°C, kinetics of Tl-1223 formation, liquid forming reactions, and nucleation and growth of Tl-1223. Conclusions and future work are summarized.

17045 (CONF-9407153–Vol.1, pp. 671-681) **Development and processing of Tl1223 wires and tapes.** Roth, P. (Sandia National Labs., Albuquerque, NM (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The development and processing of Tl-1223 wires and tapes are outlined. The following topics are discussed: thermal processing optimization (solid phase); compositional designed matrix; rapid thermal processing; effects of carbon impurity; and extrusion methods and x-ray image analysis.

17118 (LA-UR–95-967) **Dynamics of current driven disordered Josephson junction arrays.** Dominguez, D.; Gronbech-Jensen, N.; Bishop, A.R. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9503124–1: Workshop on macroscopic quantum phenomena and coherence in superconducting networks, Frascati (France), 1-5 Mar 1995). Order Number DE95009418. Source: OSTI; NTIS; GPO Dep.

We present dynamical simulations of disordered Josephson junction arrays with a bias current. We study the IV characteristics and vortex dynamics as a function of integer frustration f = n, weak frustration f = n + δ ($\delta \ll 1$) and full frustration pairs close to the critical current i_c. We focus on the study of the plastic flow of vortices (f = n + δ), of vortex-antivortex pairs (f = n), and the dynamics of domain walls (f = n + 1/2) close to i_c. We analyze the voltage noise and vortex fluctuations in the plastic flow regimes. We obtain the phase diagram for the different dynamical regimes as a function of disorder and applied current. We also study the dynamical critical behavior of depinning close to i_c in the gauge glass limit of the model, f $\rightarrow \infty$, calculating critical exponents for the voltage onset and voltage fluctuations. We discuss our results within the context of present theories of the non-linear dynamics of disordered media.

17142 (DOE/PC/90297–T11) **Impact of nonequilibrium particle temperature considerations on seeded coal combustion plasma properties. Quarterly report, quarter No. 10, January 1, 1993–March 30, 1993.** Oni, A.A. Morgan State Univ., Baltimore, MD (United States). School of Engineering. [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90297. Order Number DE95009817. Source: OSTI; NTIS; GPO Dep.

The first of the three tasks of this research activity is to develop a model that represents steady, nonequilibrium energy interactions between post-combustion entrained particles and carrier gases, under typical coal-fired MHD operating conditions. The second task is to use the developed model to evaluate, for both the MHD linear

channel and disk configurations, the impact of nonequilibrium particle temperatures on predicted gasdynamic and electrical property values that depend, at times critically, on plasma temperatures, and on which the overall MHD system performance depends. The third task is to evaluate the relative impact of gas-particle temperature differences on generator slag phenomena and consequently on MHD channel performance.

17144 (NIFS–320) **Computer simulation of a magnetohydrodynamic dynamo. 2.** Kageyama, Akira; Sato, Tetsuya. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 51p. Order Number DE95767949. Source: OSTI; NTIS; INIS.

We performed a computer simulation of a magnetohydrodynamic dynamo in a rapidly rotating spherical shell. Extensive parameter runs are carried out changing the electrical resistivity. It is found that the total magnetic energy can grow more than ten times larger than the total kinetic energy of the convection motion when the resistivity is sufficiently small. When the resistivity is relatively large and the magnetic energy is comparable or smaller than the kinetic energy, the convection motion maintains its well-organized structure. However, when the resistivity is small and the magnetic energy becomes larger than the kinetic energy, the well-organized convection motion is highly disturbed. The generated magnetic field is organized as a set of flux tubes which can be divided into two categories. The magnetic field component parallel to the rotation axis tends to be confined inside the anticyclonic columnar convection cells. On the other hand, the component perpendicular to the rotation axis is confined outside the convection cells. (author).

17145 (BARC–1994/P/004) **Laser and Plasma Technology Division annual report 1993.** Venkatramani, N. (Bhabha Atomic Research Centre, Bombay (India). Laser and Plasma Technology Div.); Verma, R.L. (eds.). Bhabha Atomic Research Centre, Bombay (India). 1994. 136p. Order Number DE95628321. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the activities of the Laser and Plasma Technology Division during the year 1993. This Division is engaged in the research and development of high power beams namely laser, plasma and electron beams, which are characterized by high power density, normally in excess of 1 kW/mm^2. Laser and Plasma Technology Division has strived to establish indigenous capability to cater to the requirements of the Department of Atomic Energy. The broad programme objectives of the Division are : (1) Development and technology readiness studies of laser, plasma and electron beam devices, (2) Studies on related physical phenomena with a view to gain better understanding of the devices, and (3) Improvements in technology and exploration of new areas. This report covers the activities of the Division during 1993 and describes how successfully the objectives have been met. The activities described in the report are diverse in nature. The report has been compiled from individual reports of various groups/sections with marginal editing. (author). refs., tabs., figs.

17146 (DOE/ER–0313/16, pp. 505-511) **Neutron damage to diagnostic mirrors.** Farnum, E.H. (Los Alamos National Lab., NM (United States)); Clinard, F.W. Jr.; Regan, S.P.; Schunke, B. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Diagnostic systems for fusion reactors will require mirrors capable of reflecting electromagnetic radiation in the soft x-ray, near uv, visible, and ir wavelengths. These components will be exposed to significant fluences of fast neutrons during use. Mirrors made from alternating layers of low-Z and high-Z materials were irradiated to a fluence of 1.1 x 10^{23} n/m^2 at 270-300°C, and subsequently evaluated for structural changes and in some cases changes in optical properties. Short-wavelength mirrors retained their structural integrity while exhibiting slight changes in reflectance; some long-wavelength mirrors showed structural degradation, while others did not. These results are discussed in terms of materials damage effects and possibilities for improvement of mirror performance under severe operating conditions.

17147 (DOE/ET/53088–691) **Reynolds stress of localized toroidal modes.** Zhang, Y.Z. (International Center for Theoretical Studies, Trieste (Italy)); Mahajan, S.M. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Feb 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–691). Order Number DE95008750. Source: OSTI; NTIS; INIS; GPO Dep.

An investigation of the 2D toroidal eigenmode problem reveals the possibility of a new consistent 2D structure, the dissipative BM-II mode. In contrast to the conventional ballooning mode, the new mode is poloidally localized at $\pi/2$ (or $-\pi/2$), and possesses significant radial asymmetry. The radial asymmetry, in turn, allows the dissipative BM-II to generate considerably larger Reynolds stress as compared to the standard slab drift type modes. It is also shown that a wide class of localized dissipative toroidal modes are likely to be of the dissipative BM-II nature, suggesting that at the tokamak edge, the fluctuation generated Reynolds stress (a possible source of poloidal flow) can be significant.

17148 (DOE/ET/53088–694) **Stabilization of the resistive shell mode in tokamaks.** Fitzpatrick, R.; Aydemir, A. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Feb 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–694). Order Number DE95008748. Source: OSTI; NTIS; INIS; GPO Dep.

The stability of current-driven external-kink modes is investigated in a tokamak plasma surrounded by an external shell of finite electrical conductivity. According to conventional theory, the ideal mode can be stabilized by placing the shell sufficiently close to the plasma, but the non-rotating "resistive shell mode," which grows on the characteristic L/R time of the shell, always persists. It is demonstrated, using both analytic and numerical techniques, that a combination of strong edge plasma rotation and dissipation somewhere inside the plasma is capable of stabilizing the resistive shell mode. This stabilization mechanism does not necessarily depend on toroidicity or presence of resonant surfaces inside the plasma.

17149 (DOE/ET/53088–697) **Shear flow effects on ion thermal transport in tokamaks.** Tajima, T. (Univ. of Texas, Austin, TX (United States). Institute for Fusion Studies); Horton, W.; Dong, J.Q.; Kishimoto, Y. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Mar 1995. 41p. Sponsored by USDOE, Washington, DC (United States);Japan Atomic Energy Research Inst., Tokyo (Japan). DOE Contract FG05-80ET53088. (IFSR–697). Order Number DE95009115. Source: OSTI; NTIS; INIS; GPO Dep.

From various laboratory and numerical experiments, there is clear evidence that under certain conditions the presence of

sheared flows in a tokamak plasma can significantly reduce the ion thermal transport. In the presence of plasma fluctuations driven by the ion temperature gradient, the flows of energy and momentum parallel and perpendicular to the magnetic field are coupled with each other. This coupling manifests itself as significant off-diagonal coupling coefficients that give rise to new terms for anomalous transport. The authors derive from the gyrokinetic equation a set of velocity moment equations that describe the interaction among plasma turbulent fluctuations, the temperature gradient, the toroidal velocity shear, and the poloidal flow in a tokamak plasma. Four coupled equations for the amplitudes of the state variables radially extended over the transport region by toroidicity induced coupling are derived. The equations show bifurcations from the low confinement mode without sheared flows to high confinement mode with substantially reduced transport due to strong shear flows. Also discussed is the reduced version with three state variables. In the presence of sheared flows, the radially extended coupled toroidal modes driven by the ion temperature gradient disintegrate into smaller, less elongated vortices. Such a transition to smaller spatial correlation lengths changes the transport from Bohm-like to gyrobohm-like. The properties of these equations are analyzed. The conditions for the improved confined regime are obtained as a function of the momentum-energy deposition rates and profiles. The appearance of a transport barrier is a consequence of the present theory.

17150 (ENEA-RT-ERG-FUS–93-01) **Formation and evolution of wall protective plasma shield in hard disruption.** Sestero, A. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione). Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Jun 1993. 53p. (RT/ERG-FUS–93-01). Order Number DE95771029. Source: OSTI; NTIS (US Sales Only).

The behaviour of the material ablated from the wall in a hard disruption is analyzed, in order mainly to ascertain its capability of protecting the wall from more severe damage. The investigation is limited to the fast first phase of the disruption, during which most of the bulk plasma thermal energy is spilled off. Within the ablated material an interaction region and a trasmission region are defined. The first region (the 'virtual limiter') is where the bulk plasma thermal energy is dumped, and the associated kinetic energy flux changed to radiation flux. The second region ('plasma shield') is where the radiative energy flux is significantly attenuated, being thus prevented from more seriously injuring the solid wall. The whole problem is investigated in terms of a simplified mathematical model, which is shown to have a similarity solution. By making further approximations, a solution is derived in full analytical terms. Applications are made to an Iter-type and to an Ignitor-type tokamaks.

17151 (ENEA-RT-ERG-FUS–93-12) **Electromagnetic forces on ITER first wall and blanket.** Ferrari, M. (ENEA, Frascati (Italy). Area Nucleare); Simbolotti, G.; Rubinacci, G.; Pellegrino, L. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Jun 1993. 50p. (CONF-9210503–1: Workshop on electromagnetic forces and related effects on blankets and other structures surrounding the plasma torus, Karlsruhe (Germany), 20-21 Oct 1992; RT/ERG-FUS–93-12). Order Number DE95771025. Source: OSTI; NTIS (US Sales Only).

In the tokamak fusion devices electromagnetic transients occur during normal and off-normal operation conditions (e.g. start-up, plasma disruption). As a consequence, eddy currents and related electrodynamic forces are induced in the conductive structures surrounding the plasma. The behaviour of the first wall/blanket system during plasma disruption events has been investigated within the framework of a study contract between ENEA (Italian Agency for New Technolgies, Energy and the Environment) and the University of Napoli. The analyses have been performed by using the CARIDDI finite element code, assuming the ITER (International Thermonuclear Experimental Reactor) plasma scenarios and geometry as a reference.

17152 (ENEA-RT-ERG-FUS–94-08) **Consistent determination of pressure/toroidal magnetic field profiles in Grad-Shafranov's equation.** Lo Surdo, C. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione). Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Oct 1994. 23p. (RT/ERG-FUS–94-08). Order Number DE95771035. Source: OSTI; NTIS (US Sales Only).

A dissipative model of a stationary, axisymmetric plasma configuration which allows to compute the pressure p and the toroidal magnetic field $B\phi$ as functions of the poloidal magnetic flux Ψ in Grad-Shafranov's equation is considered. This will be obtained through the solution of four coupled equations in the four unknowns p, $B\phi$, T (temperature) and Ψ.

17153 (ENEA-RT-ERG-FUS–94-11) **Experimental plasma equilibrium reconstruction from kinetic and magnetic measurements in FTU Tokamak.** Alladio, F. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Micozzi, P. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Jul 1994. 31p. (RT/ERG-FUS–94-11). Order Number DE95771034. Source: OSTI; NTIS (US Sales Only).

Behaviour of FTU tokamak plasma was analyzed using two reconstructive MHD equilibrium codes: the first code works by using the magnetic data alone and the second one by including as well the shape of the kinetic pressure profile, as obtained from the measured profiles of electron temperature T_e and density n_e. The code that analyzes the magnetic data alone provides a good evaluation of the macroscopic quantities such as poloidal beta B_p and internal inductance l_i, if the plasma elongation is greater than 1.04. No detailed information about the toroidal current density profile J_ϕ and the safety factor profile q can be obtained from the magnetic data alone. On the other hand, the coupling of magnetic and kinetic data is able to provide a reasonable estimate of the toroidal current density profile and of its behaviour during the plasma discharge. The reliability of the J_ϕ and q profiles reconstruction has been explored and validated by a detailed comparison with the observed MHD behaviour of the FTU plasma discharges. A good agreement between the apparence of the sawtooth activity and the drop of the safety factor on the magnetic axis qo to unity is observed. Also, at least for edge safety factors $q\psi$ less than four, the sawtooth inversion radius is found to be very close to the q=1 surface. A remarkable correspondence between $J\phi$ and $T_e^{3/2}$ is found in sawtoothing discharges. The structure of the snake oscillation in pellet injected discharges is found to be strictly correlated to the position of the q=1 surface. A cylindrical linear tearing mode stability calculation applied to the reconstructed $J\phi$ profile has shown qualitative agreement with the appearence of the Mirnov oscillations. Finally the magnetic reconnections between double resonant surfaces during the rise of the plasma current or after the pellet injection have provided an interesting validation of the $J\phi$ profile reconstruction.

17154 (ENEA-RT-ERG-FUS–94-12) **Exact and appoximate geometric calculations for toroidal D-shaped plasmas: Application to Ignitor-Ult.** Rollet, S. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Pedretti, E. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Jul 1994. 24p. (RT/ERG-FUS–94-12). Order Number DE95771027. Source: OSTI; NTIS (US Sales Only).

For a tiroidal D-shaped plasma, this paper presents exact formulas to calculate geometrical quantities of interest to plasma physicists and engineers. Each quantity (plasma cross section, volume, circumference and surface, including outboard and inboard fractions) can be expressed in the form $Q=Q_{circ}F_Q$, where Q is the quantity pertaining to the D-shaped plasma (characterized by major radius R_0, minor radii a, b and triangularity τ); Q_{circ} is the corresponding quantity for the circular plasma of parameteres R_0, a; and F_Q is an adimensional factor (only containing simple integrals) which depends on τ, on the elongation $\kappa=b/a$ and on the aspect ratio $A=R_0/a$. Besides giving exact formulas, it is proposed two approximating procedures, one graphical and one numerical. Within their validity limits ($0<=\tau<=1$, $1.4<=\kappa<=2.6$ and any A) the approximating formulas - only derived for plasma cross section, volume, circumference and surface - allow a quick determination of the quantities Q with an accuracy better than 1%. As an example, it is presented the results of calculations performed by exact formulas and by approximating procedures for the triangular plasma of the Ignitor-Ult tokamak.

17155 (ENEA-RT-ERG-FUS–94-16) **Linear and non-linear dynamics of Alfven Eigenmodes in Tokamaks.** Vlad, G. (ENEA,

Frascati (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute); Zonca, F.; Romanelli, F.; Kar, C. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute. Aug 1994. 72p. (RT/ERG-FUS–94-16). Order Number DE95771032. Source: OSTI; NTIS (US Sales Only).

Linear and non-linear dynamics of various toroidicity induced global Alfven Eigenmodes is investigated by means of an initial value numerical code. The code uses the reduced magnetohydrodynamic (MHD) model expanded to the third order in the inverse aspect ratio parameter belonging to (belonging to$\equiv a/R_o$). Non-linear saturation is shown to occur due to the excitation of a perturbation to the non-linear mode structure, which dissipates energy on very short scales. In particular the non-linear saturation of the Toroidal Alfven Eigenmodes (TAE) and of the Resistive Periodic Shear Alfven Eigenmodes (RPSAE) due to MHD non-linearities is investigated and compared with analytical predictions.

The first results of the program for the characterization of the thermal flux on the FTU poloidal limiter during disruptions are presented. Data on power fluxes are obtained by using an infrared detector and a set of thermocouples. Two peaks in the limiter thermal load, corresponding to the thermal (up to 500 MW/m2) and magnetic quenches, are well resolved by the infrared detector allowing the time correlation with other first diagnostic measurements. The dependence on the main plasma parameters of the intensity and time evolution of the thermal flux to the limiter is discussed.

17158 (ENEA-RT-ERG-FUS–94-19, pp. 17-28) **Characterization of scrape off layer plasma in FTU tokamak.** Pericoli-Ridolfini, V. (ENEA, Frascati (Italy). The average values of the scrape-off layer (SOL) plasma quantities of the FTU, density, temperature, e-folding lenghts, as well as the structure of their poloidal variation, are studied as a function of the macroscopic plasma parameters and are satisfactorily compared with 2D model predictions. An explanation is proposed for the poloidal asymmetries based on the variation of the magnetic line connection length. A self consistent model of the FTU plasma, 0D in the core and 1D in the SOL, can reproduce the main features of the impurity production and power radiation in FTU.

17159 (ENEA-RT-ERG-FUS–94-19, pp. 29-40) **Impurity production and screening in FTU.** Bartiromo, R. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Condrea, I.; De Angelis, R.; Leigheb, M. No corporate text available. Jul 1994. (CONF-9405310–Exc.: 11. international conference on plasma surface interactions, Ibaraki-Ken (Japan), 23-27 May 1994; RT/ERG-FUS–94-19). In *Contributions to 11. international conference on plasma surface interactions.* 55p. Order Number DE95771047. Source: OSTI; NTIS (US Sales Only).

The production and retention of metallic impurities in the FTU scrape off layer have been studied by inserting a Titanium target in the plasma periphery. Deuterium sputtering reasonably accounts for the impurities produced, while their retention in the SOL improves when the last closed magnetic surface is approched.

17160 (ENEA-RT-ERG-FUS–94-19, pp. 41-55) **Avanced study of impurity transport in ITER tokamak.** Zagorski, R. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)). No corporate text available. Jul 1994. (CONF-9405310–Exc.: 11. international conference on plasma surface interactions, Ibaraki-Ken (Japan), 23-27 May 1994; RT/ERG-FUS–94-19). In *Contributions to 11. international conference on plasma surface interactions.* 55p. Order Number DE95771047. Source: OSTI; NTIS (US Sales Only).

The 2D-multifluid code EPIT has been used to study the problem of impurity production and transport in the ITER tokamak scrape-off layer (SOL). Calculations have been performed for beryllium, carbon and nickel target plates under the assumption that physical sputtering is the only mechanism of the impurity production. Results show that for the beryllium and carbon plates the plate erosion is high. In the case of carbon plates, up to 45% of the power flowing to the SOL can be radiated. For beryllium plates, impurity radiation is negligible. In the case of nickel, radiation is much stronger (up to 65%) and, simultaneously, impurity production much lower, while the impurity retention in the SOL improves. A simple 1D analytical model of the SOL is proposed in under to determine the dependence of the plasma parameters at the plate on the input energy, particle fluxes and the hydrogen recycling. A comparison between model predictions and code results is presented.

17161 (ENEA-RT-ERG-FUS–94-20) **Proposal for two colour interferometer for FTU.** Frigione, D. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Tudisco, O. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Nov 1994. 16p. (RT/ERG-FUS–94-20). Order Number DE95771024. Source: OSTI; NTIS (US Sales Only).

A proposal for setting up a two colour interferometer employing a CO_2 laser (lamda=10.6μm) compensated by a HeNe one to be installed on FTU Tokamak (Frascati Tokamak Upgrade) has presented. This instrument aims at measuring the plasma electron density in the high density regime (beyond 2.5 x $10^{20}m^{-3}$) and in presence of fast perturbations such as those induced by pellet injection. The proposed main wavelength makes the instrument almost insensitive to plasma refraction problems requiring, on the other side, another laser for compensating mechanical vibrations. The high beating frequency (40 MHz) between the probe beam and the reference beam, obtained by opto-acoustic modulators, should allow to follow rapid density variations. It is planned to set up a single channel probing the plasma along a vertical diameter of the poloidal cross section, to integrate the present density measurements and possibly be a prototype for a multi-channel system.

17162 (ENEA-RT-ERG-FUS–94-22) **Characteristics of FTU scrape-off layer (SOL) determined by a simple 1-D model.** Ferro, C. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione). No corporate text available. Dec 1994. 22p. Sponsored by Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). (RT/ERG-FUS–94-22). Order Number DE95771048. Source: OSTI; NTIS (US Sales Only).

A simple 1-D model analytical model has been developed to determine the SOL characteristics from the parameters of the main plasma. The solutions are compared with FTU experimental data. The solutions fit quite well the experimental data and their trend. Moreover the model suggests the presence of a critical density related to the non isothermal power flux and the corresponding maximum power which can be safely removed by volumetric sinks. Differences between a limiter-like configuration and a divertor-like configuration are described.

17163 (ETDE-IT–95-16) **Self-consistent analysis of impurity dynamics on FTU-Tokamak.** Zagorski, R. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Romanelli, F.; Pieroni, L. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). 1995. 28p. Order Number DE95771052. Source: OSTI; NTIS (US Sales Only).

A self consistent treatment of the bulk and scrape-off layer plasma in the Frascati Tokamak Upgrade (FTU) is presented. The model is based on the 0-D description of the plasma transport in the tokamak centre and on the 1-D model of the SOL plasma dynamics. The FTU configuration with the poloidal inconel limiter is considered. Preliminary calculations for the configuration with the molybdenum and tungsten limiter phase are also presented. The comparison with the experimental data shows good agreement with the results of the model.

17164 (GA-A–21716) **Effects of particle fueling and plasma wall interactions on DIII-D discharges.** Jackson, G.L. (General Atomics, San Diego, CA (United States)); Baker, D.R.; Holtrop, K.L.; Staebler, G.M.; West, W.P.; Maingi, R.; Konoshima, S. General Atomics, San Diego, CA (United States). Nov 1994. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-940580–26: 11. international conference on plasma surface interactions in controlled fusion devices, Mito (Japan), 23-27 May 1994). Order Number DE95009608. Source: OSTI; NTIS; INIS; GPO Dep.

DIII-D has successfully operated with an all-graphite first wall, including the first observations of VH-mode without boronization. A major goal of this, and other recent upgrades, was to control impurity influxes and hydrogenic fueling. Graphite tiles were carefully pre-conditioned, first by ex situ preparation and then by baking and helium glow conditioning. No deuterium or hydrogen was used until tokamak operation commenced. With the all graphite wall, both impurity and deuterium influxes during tokamak discharges were lower than previous boronized discharges; central nickel impurity line radiation, NiXXV and NiXXVI, was an order of magnitude lower than previous discharges during the ELM free beam heated phase. The effect of reduced particle fueling on plasma performance, particularly H- and VH-mode discharges, will be presented.

17165 (GA-A–21793) **Stabilization of ballooning modes with sheared toroidal rotation.** Miller, R.L.; Waelbroeck, F.W.; Lao, L.L.; Taylor, T.S. General Atomics, San Diego, CA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-92ER54150. (CONF-940933–36: 15. international conference on plasma physics and controlled nuclear fusion research, Madrid (Spain), 26 Sep - 1 oct 1994). Order Number DE95008388. Source: OSTI; NTIS; INIS; GPO Dep.

A new code demonstrates the stabilization of MHD ballooning modes by sheared toroidal rotation. A shifted-circle model is used to elucidate the physics and numerically reconstructed equilibria are used to analyze DIII-D discharges. In the ballooning representation, the modes shift periodically along the field line to the next point of unfavorable curvature. The shift frequency ($d\Omega/dq$ where Ω is the angular toroidal velocity and q is the safety factor) is proportional to the rotation shear and inversely proportional to the magnetic shear. Stability improves with increasing shift frequency and, in the shifted circle model, direct stable access to the second stability regime occurs when this frequency is a fraction of the Alfven frequency $\omega_A = V_A/qR$. Shear stabilization is also demonstrated for an equilibrium reconstruction of a DIII-D VH-mode.

17166 (GA-A–21914) **"/all stabilization of high beta plasmas in DIII-D.** Taylor, T.S. (General Atomics, San Diego, CA (United States)); Strait, E.J.; Lao, L.L.; Turnbull, A.D.; Burrell, K.H.; Chu, M.S.; Ferron, J.R.; Groebner, R.J.; La Haye, R.J.; Mauel, M. General Atomics, San Diego, CA (United States); Oak Ridge National Lab., TN (United States); Lawrence Livermore National Lab., CA (United States). Feb 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; AC05-84OR21400 ; W-7405-ENG-48. (CONF-941101–9: Meeting of the Division of Plasma Physics of the American Physical Society, Minneapolis, MN (United States), 7-11 Nov 1994). Order Number DE95009607. Source: OSTI; NTIS; INIS; GPO Dep.

Detailed analysis of recent high beta discharges in the DIII-D tokamak demonstrates that the resistive vacuum vessel can provide stabilization of low n magnetohydrodynamic (MHD) modes. The experimental beta values reaching up to $\beta_T = 12.6\%$ are more than 30% larger than the maximum stable beta calculated with no wall stabilization. Plasma rotation is essential for stabilization. When the plasma rotation slows sufficiently, unstable modes with the characteristics of the predicted "resistive wall" mode are observed. Through slowing of the plasma rotation between the q = 2 and q = 3 surfaces with the application of a non-axisymmetric field, the authors have determined that the rotation at the outer rational surfaces is most important, and that the critical rotation frequency is of the order of $\Omega/2\pi = 1$ kHz.

17167 (GA-A–21926) **Development of a tokamak plasma optimized for stability and confinement.** Politzer, P.A. General Atomics, San Diego, CA (United States); Oak Ridge National Lab., TN (United States); Lawrence Livermore National Lab., CA (United States). Feb 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; AC05-84OR21400 ; W-7405-ENG-48. (CONF-941182–3: 6. international Toki conference on plasma physics and controlled nuclear fusion: Research for advanced concepts in magnetic fusion, Toki-city (Japan), 29 Nov - 2 dec 1994). Order Number DE95009609. Source: OSTI; NTIS; INIS; GPO Dep.

Design of an economically attractive tokamak fusion reactor depends on producing steady-state plasma operation with simultaneous high energy density (β) and high energy confinement (τ_E); either of these, by itself, is insufficient. In operation of the DIII-D tokamak, both high confinement enhancement ($H \equiv \tau_E/\tau_{ITER-89P} = 4$) and high normalized β ($\beta_N \equiv \beta/(I/aB) = 6\%$-m-T/MA) have been obtained. For the present, these conditions have been produced separately and in transient discharges. The DIII-D advanced tokamak development program is directed toward developing an understanding of the characteristics which lead to high stability and confinement, and to use that understanding to demonstrate stationary, high performance operation through active control of the plasma shape and profiles. The authors have identified some of the features of the operating modes in DIII-D that contribute to better performance. These are control of the plasma shape, control of both bulk plasma rotation and shear in the rotation and Er profiles, and particularly control of the toroidal current profiles. In order to guide their future experiments, they are developing optimized scenarios based on their anticipated plasma control capabilities, particularly using fast wave current drive (on-axis) and electron cyclotron current drive (off-axis). The most highly developed model is the second-stable core VH-mode, which has a reversed magnetic shear safety factor profile [$q(O) = 3.9$, $q_{min} = 2.6$, and $q_{95} = 6$]. This model plasma uses profiles which the authors expect to be realizable. At $\beta_N \geq 6$, it is stable to n=l kink modes and ideal ballooning modes, and is expected to reach $H \geq 3$ with VH-mode-like confinement.

17168 (IC–95/31) **"Heavy light bullets" in electron-positron plasma.** Berezhiani, V.I.; Mahajan, S.M. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 42p. Order Number DE95628408. Source: OSTI; NTIS (US Sales Only); INIS.

The nonlinear propagation of circularly polarized electromagnetic waves with relativistically strong amplitudes in an unmagnetized hot electron-positron plasma with a small fraction of ions is investigated. The possibility of finding localized solutions in such a plasma is explored. It is shown that these plasmas support the propagation of "heavy light bullets"; nondiffracting and nondispersive electromagnetic (EM) pulses with large density bunching. (author). 24 refs, 12 figs.

17169 (INIS-JP–028, pp. 82-84) **Experimental studies on the plasma-driven permeation of deuterium through nickel under plasmas.** Kodama, Kouta (Kyoto Univ. (Japan). Faculty of Engineering); Tanaka, Toshiyuki; Takagi, Ikuji; Fujita, Haruyuki; Shin, Kazuo; Higashi, Kunio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Plasma-driven permeation (PDP) of deuterium through nickel membrane at the non-steady state were experimentally studied using a small rf-plasma device. When the sample was exposed to the deuterium plasma for a short time, the maximum permeation rate of the PDP at the non-steady state increased almost linearly with the exposure time. The evolution curves of the permeation flux could be well reproduced by numerical calculations. (author).

17170 (INIS-JP–040) **Aiming at nuclear fusion reactors. Present status of nuclear fusion research and development in JAERI.** Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment. Nov 1994. 91p. (In Japanese). Order Number DE95768258. Source: OSTI; NTIS; INIS.

Nuclear fusion is expected as the ultimate method of stably supplying energy which is the motive power of the durable development of civilized society coping with the increase of world population and the accompanying increase of energy consumption. The fuel and material resources required for nuclear fusion are not distributed unevenly in the world, and exist inexhaustibly in reality. Nuclear fusion reaction stops immediately when fuel supply is stopped, therefore, it has high safety in principle. Helium which is produced as the result of nuclear fusion is the harmless gas without radiation emission. The effect that the neutrons generated simultaneously exert to global environment weakens quickly. As for the research on nuclear fusion, the condition of critical plasma was attained with tokamaks, and the control of plasma has progressed. Also the technologies including superconducting magnets have advanced. The international project of ITER design is in progress. In this book, nuclear fusion and tokamaks, the concept of nuclear fusion reactors and ITER project, the confinement of plasma, the device of the component machinery and equipment, the basic research and the development of hereafter are described. (K.I.).

Some results are presented of Schlieren and interferometric diagnostics of the high current discharge (0.5 kJ, 50 kA, T≈2 μs) between two cone-shaped electrodes in nitrogen and argon (pressure 2-50 kPa). The pulse length of the diagnostic laser was 40 ns. The plasma was accelerated due to the Lorentz force in a radial direction towards the discharge symmetry axis, and two parts - plasma jets and a relatively long-living plasma structure - were produced. The characteristics and parameters of this structure may be described using magnetohydrodynamic turbulence phenomena. 6 refs.

The recycling of fuel and impurity particles in the scrape-off layer (SOL) of a tokamak is important for effective magnetic confinement. This phenomenon is closely associated with the transport process of these particles in the SOL. Hence we attempted to measure the time-dependent spatial flux distribution with an emphasis on fuel (deuterium) in the SOL of a tokamakf (JFT-2M). Recently a rotatable collector probe was installed at the surface station of the JFT-2M. A preliminary test showed a good performance in operating the probe system for the study on time behavior of particles. (J.P.N.).

17179 (JAERI-Review–94-011) **Annual report of Naka Fusion Research Establishment for the period from April 1, 1993 to March 31, 1994.** Matoba, Tohru (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Nakamura, Yukiharu; Matsuzaki, Yoshimi; Araki, Masanori; Yamane, Yoshifumi (eds.). Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1995. 134p. Order Number DE95768202. Source: OSTI; NTIS; INIS.

Research and development activities at Naka Fusion Research Establishment, JAERI, are reported for the period from April 1, 1993 to March 31, 1994. The main objectives of JT-60U experiments in FY1993 were to achieve and sustain high confinement regime with current drive. The JFT-2M experiments progressed in the systematic study of the plasma responses by applying an external helical field and also in the study of the boundary plasma with electric field or current in the scrape off layer (SOL) introduced by the divertor bias system. The study in Plasma Theory and Computation focused on the ion temperature gradient instability, the linear toroidal particle simulation, the MHD stability and the analyses of burning plasma. The progresses on DIII-D experiments were obtained in the studies of divertor radiation, cryopumping and VH-mode plasma. As for the fusion engineering research, further developments of a ceramic vacuum pump and a high-resolution quadrupole mass spectrometer (QMS) were made. A high energy H^- beam of 400keV and 0.18A was produced with a current density of 13mA/cm^2 for 1s. Many efforts were made in developing the long pulse gyrotron and the high efficiency collector potential depression (CPD) gyrotron in the radio-frequency (RF) technology area. The main progress in the Tritium Systems Test Assembly (under US/Japan collaboration) was to demonstrate the plasma exhaust stream under non-steady tokamak operation. Heating experiments of the development 1m long divertor module for ITER were performed at a heat flux of 15MW/m^2 for 30sec. The R and D of the reactor structure were focused on the major components such as non-circular bellows, fail-safe first wall, etc.. The R and D of the blanket technology were focussed on the box structure for ITER shielding blanket and the out-of-reactor testing of ITER breeding blanket. (J.P.N.).

Short communication. PLASMA WAVES/numerical solution; FOKKER-PLANCK EQUATION; R CODES; SCHROEDINGER EQUATION

17181 (KTH-ALF-R–94-3) **Induced surface current effects on a magnetized plasma surrounded by a conducting wall.** Lehnert, B. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Oct 1994. 29p. Order Number DE95629063. Source: OSTI; NTIS; INIS.

An earlier analysis of induced surface current effects on free-boundary modes of a magnetically confined plasma is extended to the case where the plasma is surrounded by a conducting wall. Two types of induced surface currents can then be identified. The first is due to the inhomogeneity of an externally imposed magnetic field part, and it exists also in absence of a conducting wall. The second is caused by compression or expansion of the magnetic field in the plasma-wall spacing. An analysis is further presented in which the plasma boundary condition and the induced surface currents become basic concepts in the formulation of the energy principle. A discussion of and comparison with the conventional extended energy principle is performed in which questionable points of the latter are being identified. 9 refs, 5 figs.

17182 (KTH-ALF-R–95-1) **Numerical solution of linearized resistive MHD equations in a cylindrical geometry.** Li, Jin. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. 1995. 35p. Order Number DE95629064. Source: OSTI; NTIS; INIS.

Linearized resistive MHD eigenequations in a cylindrical geometry are derived and numerical methods are presented. The eigenequations are solved in a global manner such that there is no need to distinguish inner resistive layer and outer ideal region analytically. Resistive layer is numerically treated by using non-uniform mesh grid technique and high accuracy discretization scheme. Lundquist number S up to 10^9 can be easily achieved. Numerical results are benchmarked by known analytical solutions and other numerical methods. 6 refs, 5 figs.

17183 (KTH-ALF-R–95-2) **Over-relaxation phenomena during the set-up of RFP plasmas.** Nordlund, P.; Mazur, S. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Fusion Plasma Physics. Mar 1995. 18p. Order Number DE95629065. Source: OSTI; NTIS; INIS.

Experiments on the Extrap T1 reversed field pinch have shown that the formation of the RFP configuration is quite sensitive to the relative programming of the toroidal field and ohmic heating circuits. In this paper, new measurements of the evolution of the current density profile and of the spectral structure of the fluctuations during the set-up phase of RFP plasmas in the T1 experiment are presented. These measurements improve the understanding of the role of different spectral components in the dynamics of RFP formation. Under unfavourable (slow) set-up conditions, comparatively high energy is accumulated in m = 1 internal kinks prior to reversal of the edge toroidal fields. At reversal, nonlinearly driven m = 0 modes trigger a rapid broadening of the m = 1 spectrum. This behaviour is associated with a violent suppression of the current density in the core leading to an over-relaxation of the discharge involving a hollowing of the parallel current density profile. The over-relaxation phenomenon increases the volt-second consumption and plasma/wall interaction during RFP set-up, and degrades the flat-top discharge performance. 15 refs, 5 figs, 1 tab.

17184 (PPPL–3063) **Measurement of loss of DT fusion products using scintillator detectors in TFTR.** Darrow, D.S. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Herrmann, H.W.; Johnson, D.W.; Marsala, R.J.; Palladino, R.W.; Zweben, S.J.; Tuszewski, M. Princeton Univ., NJ (United States). Plasma Physics Lab. Mar 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-940552–38: 10. topical conference on high-temperature plasma diagnostics, Rochester, NY (United States), 8-12 May 1994). Order Number DE95008711. Source: OSTI; NTIS; INIS; GPO Dep.

A poloidal array of MeV ion loss probes previously used to measure DD fusion product loss has been upgraded to measure the loss of alpha particles from DT plasmas in TFTR. The following improvements to the system have been made in preparation for the use of tritium in TFTR: (1) relocation of detectors to a neutron-shielded enclosure in the basement to reduce neutron-induced background signals; (2) replacement of ZnS:Cu (P31) scintillators in the probes with the $Y_3Al_5O_{12}$:Ce(P46) variety to minimize damage and assure linearity at the fluxes anticipated from DT plasmas; and (3) shielding of the fiber optic bundles which carry the fight from the probes to the detectors to reduce neutron- and gamma-induced light within them. In addition to the above preparations, the probes have been absolutely calibrated for alpha particles by using the Van de Graaf accelerator at Los Alamos National Laboratory. Alpha particle losses from DT plasmas have been observed, and

losses at the detector 901 below the midplane are consistent with first orbit loss.

17185 (PPPL–3091) **High harmonic fast waves in high beta plasmas.** Ono, Masayuki. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95009852. Source: OSTI; NTIS; INIS; GPO Dep.

High harmonic fast magnetosonic wave in high beta/high dielectric plasmas is investigated. including the finite-Larmor-radius effects. In this regime, due to the combination of group velocity slow down and the high beta enhancement, the electron absorption via electron Landau and electron magnetic pumping becomes significant enough that one can expect a strong ($\sim$ 100%) single pass absorption. By controlling the wave spectrum, the prospect of some localized electron heating and current drive appears to be feasible in high beta low-aspect-ratio tokamak regimes. Inclusion of finite-Larmor-radius terms shows an accessibility limit in the high ion beta regime (β_i = 50% for a deuterium plasma) due to mode-conversion into an ion Bernstein-wave-like mode while no beta limit is expected for electrons. With increasing ion beta, the ion damping can increase significantly particularly near the beta limits. The presence of energetic ion component expected during intense NBI and α-heating does not appear to modify the accessibility condition nor cause excessive wave absorption.

17186 (PPPL–3092) **Comparison of the calculations of the stability properties of a specific stellarator equilibrium with different MHD stability codes.** Nakamura, Y. (Kyoto Univ. (Japan). Plasma Physics Lab.); Matsumoto, T.; Wakatani, M.; Galkin, S.A.; Drozdov, V.V.; Martynov, A.A.; Poshekhonov, Yu.Yu.; Ichiguchi, K.; Garcia, L.; Carreras, B.A. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95009851. Source: OSTI; NTIS; INIS; GPO Dep.

A particular configuration of the LHD stellarator with an unusually flat pressure profile has been chosen to be a test case for comparison of the MHD stability property predictions of different three-dimensional and averaged codes for the purpose of code comparison and validation. In particular, two relatively localized instabilities, the fastest growing modes with toroidal mode number n = 2 and n = 3 were studied using several different codes, with the good agreement that has been found providing justification for the use of any of them for equilibria of the type considered.

17187 (PPPL–3093) **Trapped ion mode in toroidally rotating plasmas.** Artun, M.; Tang, W.M.; Rewoldt, G. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95009854. Source: OSTI; NTIS; INIS; GPO Dep.

The influence of radially sheared toroidal flows on the Trapped Ion Mode (TIM) is investigated using a two-dimensional eigenmode code. These radially extended toroidal microinstabilities could significantly influence the interpretation of confinement scaling trends and associated fluctuation properties observed in recent tokamak experiments. In the present analysis, the electrostatic drift kinetic equation is obtained from the general nonlinear gyrokinetic equation in rotating plasmas. In the long perpendicular wavelength limit $k_\tau \rho_{bi} \ll 1$. where ρ_{bi} is the average trapped-ion banana width, the resulting eigenmode equation becomes a coupled system of second order differential equations nmo for the poloidal harmonics. These equations are solved using finite element methods. Numerical results from the analysis of low and medium toroidal mode number instabilities are presented using representative TFTR L-mode input parameters. To illustrate the effects of mode coupling, a case is presented where the poloidal mode coupling is suppressed. The influence of toroidal rotation on a TFTR L-mode shot is also analyzed by including a beam species with considerable larger temperature. A discussion of the numerical results is presented.

17188 (PPPL–3094) **Rapid guiding center calculations.** White, R.B. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Boozer, A.H. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95009853. Source: OSTI; NTIS; INIS; GPO Dep.

Premature loss of high energy particles, and in particular fusion alpha particles, is very deleterious in a fusion reactor. Because of this it is necessary to make long-time simulations, on the order of the alpha particle slowing down time, with a number of test particles sufficient to give predictions with reasonable statistical accuracy. Furthermore it is desirable to do this for a large number of equilibria with different characteristic magnetic field ripple, to best optimize engineering designs. In addition, modification of the particle distribution due to magnetohydrodynamic (MHD) modes such as the saw tooth mode present in the plasma can be important, and this effect requires additional simulation. Thus the large number of necessary simulations means any increase of computing speed in guiding center codes is an important improvement in predictive capability. Previous guiding center codes using numerical equilibria such as ORBIT evaluated the local field strength and ripple magnitude using Lagrangian interpolation on a grid. Evaluation of these quantities four times per time step (using a fourth order Runge-Kutta routine) constitutes the major computational effort of the code. In the present work the authors represent the field quantities through an expansion in terms of pseudo-cartesian coordinates formed from the magnetic coordinates. The simplicity of the representation gives four important advantages over previous methods.

17189 (UCRL-CR–115743) **Monthly report to LLNL from the Budker INP. Novosibirsk, September, 1992.** Ivanov, A.A.; Kotelnikov, I.A. Lawrence Livermore National Lab., CA (United States). Sep 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009528. Source: OSTI; NTIS; GPO Dep.

The experiments on a plasma equilibrium response to externally applied disturbance of the magnetic field of a dipole type have been done on the GDT facility. The disturbance was produced by a pair of the coils installed at the end tank so as it was localized in the expander region. The results were compared with the theoretical predictions based on a hydromagnetic model of plasma equilibrium in the magnetic field treated in a long thin approximation. It was found that the measured displacements of the plasma column from a geometrical axis of the device varies linearly with the current in the disturbing coils at least up to 5cm at the midplane. The data was processed to subtract the displacement measured for zero current that apparently caused by a small disturbance of the magnetic field by soft-iron-made parts of the equipment placed near the device inside the experimental hall and, in part, also by misalignments of the main coils. Theoretically predicted slope of the displacement-field amplitude dependence is to be inversely proportional to a pressure-weighted curvature averaged along the device. The authors believe this allows the use of the data for the measurements of this value. The slopes have been calculated for the GDT parameters under different assumptions on Kp parameter that define an upper limit of integration of the pressure-weighted curvature in the near-end wall region in the expanders.

17190 (UTNL-R–0302, pp. 91-101) **Electromagnetic and structural interaction analysis of curved shell structures.** Horie, T. (Kyushu Inst. of Tech., Kitakyushu, Fukuoka (Japan)); Niho, T. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (In Japanese). (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

This paper describes a finite element formulation of the eddy current and structure coupled problem for curved shell structures. Coupling terms produced by curved geometry as well as flat plate geometry were obtained. Both matrix equations for eddy current and structure were solved simultaneously using coupling submatrices. TEAM Workshop bench mark problem 16 was solved to verify the formulation and the computer code. Agreement with experimental results was very good for such plate problem. A coupled problem for cylindrical shell structure was also analyzed. Influence of each coupling term was examined. The next topic is

the eigenvalues of the coupled equations. Although the coupled matrix equations are not symmetric, symmetry was obtained by introducing a symmetrizing variable. The eigenvalues of the coupled matrix equations are different from those obtained from the uncoupled equations because of the influence of the coupling sub-matrix components. Some parameters obtained by the eigenvalue analysis have characteristics of parameters which indicate the intensity of electromagnetic structural coupling effect. (author).

17191 (UTNL-R–0302, pp. 102-113) **Analyses of eddy currents and dynamic deflections of a thin shell structure with coupling effects.** Niikura, Setsuo (Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)); Kushiyama, Masuko. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

Analyses for coupled problems between eddy currents and dynamic deflections of a thin shell structure are presented. The eddy currents are solved by the integral method (the finite element circuit method) and the deflections are solved by the finite element method with coupling effects. The electromotive force due to the deflection is considered by moving the coordinates of the discretized nodes according to the results of the deflection analyses in the Lagrangian coordinate system. The present model is based on the assumptions that the conductor is thin and the structural deflection is small. An arbitrary shaped shell structure can be analyzed by the numerical analysis code (EDDYCUFF) on which the above mentioned method is implemented. In order to verify the method, the TEAM problems 12 and 16 are calculated by EDDYCUFF. The time evolutions of the calculated eddy currents and deflections of the plate are presented and compared with the experimental results. Eddy current and electromagnetic force distributions and a deformation of the plate are shown. The calculated results agree with the experimental results and show the validity and applicability of this method. For an example of divertor plates in a fusion device, we consider the rectangular stainless steel plate simply supported at both ends. The plate is placed under a transient magnetic field and a static magnetic field. The calculated results of the plate deflections show that the electromagnetic damping effect becomes distinguished when the strength of the static field is large or the plate thickness is thin. In conclusion, we presented the method and results of the analyses for coupled problems between eddy currents and dynamic deflections of a thin shell structure. The importance of the analyses of eddy currents and dynamic deflections with coupling effects in a fusion device design was shown. (author).

17192 (UTNL-R–0302, pp. 114-140) **Experimental and numerical analysis for magnetically induced vibrations of conducting structure.** Nishio, Satoshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Nakahira, Masataka; Miura, H.; Isono, A. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

The coupling effect between the electromagnetic field and mechanical response of a conducting structure is of importance in magnetic fusion devices as tokamak machine. The electromagnetically induced motion of the structure due to the Lorentz force induces additional eddy currents and further modifies the dynamic characteristics of the system. This paper is concerned with numerical modeling of the dynamic field-structure interaction and its verification by experimental tests. Here, a finite element numerical model for mechanical deformation and a wiregrid numerical model for eddy currents are employed for non-ferrous and elastic conductors. A computer code has been developed for 3-D thin shell structure. Experimental tests for the code verification were carried out by using a rectangular thin copper plate. Three kinds of the plate supporting systems, i.e., a cantilever system, a fixed both ends system and a simply supported ends system were investigated. A good agreement between the numerical and experimental results was obtained. Therefore, the computer code developed here is available for analyzing the electromagnetomechanical behavior of the plasma facing components of the tokamak device. (author).

17193 (UTNL-R–0302, pp. 141-148) **Magnetoelastic coupled vibration of first wall with magnetic damping.** Yoshida, Y. (Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab.); Demachi, K.; Miya, K. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

Magnetoelastic coupled vibration of the ITER first wall during plasma disruption was computed taking the magnetic damping effect into account. It was found that a conventional numerical method without consideration of the damping effect significantly overestimates the dynamic stress induced at the first wall. The magnetic damping reduces dynamic stress in case of the thin first wall so that the flexible thin shell structure is applicable to fusion reactor components. (author).

17194 (UTNL-R–0302, pp. 178-188) **A large deformation theory of solids subject to electromagnetic loads and its application.** Nishiguchi, I. (Kanagawa Inst. of Tech., Atsugi (Japan)); Sasaki, M. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

A large deformation theory of deformable solids is proposed in which the interaction with electromagnetic fields is taken into account. Weak forms of the Maxwell's equations in a fixed reference configuration together with the balance of momentum constitute the governing equations for our theory. The weak forms of the Maxwell's equations in a reference configuration can be derived by the direct transformation from spatial weak forms. The results coincide with the weak forms obtained from the local expressions by Lax and Nelson though we made a distinction between the covariant and contravariant vector explicitly. For the deformable body subject to the electromagnetic fields, weak forms of the Ampere's law and/or the Faraday's law, when combined with the weak form of the balance of momentum, can serve as the governing equations of the theory. As is known, however, these equations are not sufficient to describe the response of a specific material due to a given loading. As for the momentum balance, we need the dependency of stress on the deformation and objective constitutive equations of hyperelasticity, hypoelasticity and inelasticity are available. Parallel to these, objective constitutive equations for the electromagnetism are discussed. As an application of the theory, linearized equations for quasi-static deformation under magnetic field is derived based on the vector potential formulation. (author).

The blanket system is one of the most important components in a fusion reactor because it has a major impact on both the economics and safety of fusion energy. The primary functions of the blanket in a deuterium/tritium-fueled fusion reactor are to convert the fusion energy into sensible heat and to breed tritium for the fuel cycle. The Blanket Comparison and Selection Study, conducted earlier, described the overall comparative performance of various concepts, including liquid metal, molten salt, water, and helium. This report discusses the requirements of the International Thermonuclear Experimental Reactor for a self-cooled blanket that uses liquid Li and for indirectly cooled blankets that use other alkali metals such as NaK. The report discusses the requirements for an electrically insulating coating on the first-wall structural material to minimize the MHD pressure drop during the flow of liquid metal in a magnetic field. The report addresses the thermodynamics of interactions between the liquid metals (e.g., Li and NaK) and structural materials (e.g., V-base alloys and Type 316 stainless steel) and the AlN candidate electrical insulator coating, together with associated corrosion/compatibility issues. Details are presented on the AlN coating fabrication methods, and experimental data are reported for microstructures, pretreatment of the substrate, and heat treatment of coatings, coating/substrate and coating/lithium interactions, and electrical resistance before and after exposure to lithium.

17196 (ANL/FPP/TM–280) **Summary report for ITER Task - T226B: Evaluation of ITER disruption erosion.** Hassanein, A. Argonne National Lab., IL (United States). Feb 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95010402. Source: OSTI; NTIS; INIS; GPO Dep.

The behavior of divertor materials during a major disruption in a tokamak reactor is very important to successful and reliable operation of the device. Erosion of material surfaces due to a thermal energy dump can severely limit the lifetimes of plasma-facing components and thus diminish the reactor's economic feasibility. A comprehensive numerical model has been developed and used in this analysis, which includes all major physical processes taking place during plasma/material interactions. Models to account for material thermal evolution, plasma/vapor interaction physics, and models for hydrodynamic radiation transport in the developed vapor cloud above the exposed surface are implemented in a self-consistent manner to realistically assess disruption damage. The extent of self-protection from the developed vapor cloud in front of the incoming plasma particles is critically important in determining the overall disruption lifetime. Models to study detailed effects of the strong magnetic field on the behavior of the vapor cloud and on the net erosion rate have also been developed and analyzed. Candidate materials such as beryllium and carbon are considered in this analysis. The dependence of divertor disruption lifetime on disruption physics and reactor conditions is analyzed and discussed. In addition, material erosion from melting of plasma-facing components during a tokamak disruption is also a serious problem that limits reactor operation and economical reactor lifetime. In particular, metallic low-Z components such as Be will be subjected to severe melting during disruptions and edge localized modes (ELMs). Loss of the developed melt layer will critically shorten the lifetime of these components, severely contaminate the plasma, and seriously inhibit successful and reliable operation of the reactor. In this study mechanisms responsible for melt-layer loss during a disruption are also modeled and evaluated.

17197 (CONF-950232–30) **Remote maintenance challenges presented in the ITER engineering design.** Burgess, T.W.; Herndon, J.N.; Schrock, S.L.; Lousteau, D.C. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. American Nuclear Society meeting on robotics and remote systems; Monterey, CA (United States); 5-10 Feb 1995. Order Number DE95006392. Source: OSTI; NTIS; INIS; GPO Dep.

Leading fusion energy research institutions are currently engaged in the Engineering Design Activity for the International Thermonuclear Experimental Reactor (ITER). A tokamak reactor design is evolving which emphasizes high system performance in a minimum overall reactor and building size. The resulting high component density dictates careful attention to ITER remote maintenance considerations in the development of the configuration. The complexity and scale of ITER remote maintenance tasks are well beyond the scope of today's experience and technology. This paper discusses the remote maintenance philosophy, describes the basic configuration as it relates to maintenance, and describes the basic procedures and equipment required. Key enabling technology research and development needs are also addressed.

17198 (DOE/ER–0313/16, pp. 3-7) **Status of U.S./Japan Collaborative Program Phase II HFIR target and RB* capsules.** Pawel, J.E. (Oak Ridge National Lab., TN (United States)); Senn, R.L.; Longest, A.W.; Shiba, K. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Capsules HFIR-MFE-JP9 through 16 were installed in the High Flux Isotope Reactor (HFIR) target July 20, 1990 for irradiation beginning with HFIR fuel cycle 289. Of these eight target capsules, JP10, 11, 13, 16 accumulated 18 dpa and were removed from the reactor in September 1991. JP14 was removed from the reactor at the end of cycle 310 (September 1992) after achieving a peak dose of 34 dpa. Capsules JP9, 12, and 15 completed 35 cycles on April 1, 1994 and were removed from the target region. Each capsule had accumulated a peak dose of approximately 57 dpa. Three new capsules, HFIR-MFE-JP20, 21, and 22, have been designed to complete the original experiment matrix of the JP9 through JP16 series capsules. Irradiation began in December 1993 with the start of cycle 322. As of April 1, 1994 (end of cycle 324), each capsule had achieved approximately 4.9 dpa. The RB* experiments are the continuation of the ORR spectrally tailored experiments. In this stage, a hafnium liner is used to modify the spectrum to simulate fusion helium to displacements per atom (He/dpa) ratio in the austenitic steel specimens. Of the four capsules in this set, two (60J-1 and 330J-1) were disassembled during this reporting period after accumulating a peak dose in HFIR of 11 dpa. Two capsules (200J-1 and 400J-1) are in the reactor and have achieved of 5.5 dpa.

17199 (DOE/ER–0313/16, pp. 8-9) **The COBRA-1B irradiation experiment in EBR-II.** Tsai, H. (Argonne National Lab., IL (United States)); Hins, A.G.; Strain, R.V.; Smith, D.L. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract W-31109-ENG-38. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of the forthcoming COBRA-1B experiment in EBR-II is to evaluate the effects of fast neutron irradiation on the physical and mechanical properties of candidate fusion structural materials. Of special interest in this experiment will be ITER-relevant temperature and exposure for the test specimens. Approximately 50% of the irradiation test volume will be devoted to vanadium-alloy specimens. Design of the COBRA-1B irradiation experiment began in this reporting period and is in progress. The target reactor insertion date for COBRA-1B is September 1994. Technical and programmatic feasibility approval for the experiment has been granted by EBR-II Operations.

17200 (DOE/ER–0313/16, pp. 13-14) **Revised neutron dosimetry results for the MOTA-2A experiment in FFTF.** Greenwood, L.R. (Pacific Northwest Lab., Richland, WA (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Revised neutron fluence and damage values are reported for the MOTA-2A experiment in the Fast Flux Test Facility (FFTF). This revision corrects an error with processing of the $^{235}U(n,f)$ reaction. Net corrections are on the order of 5%.

17201 (DOE/ER–0313/16, pp. 15-20) **Reanalysis of neutron dosimetry for the MOTA-1A/1B experiments in FFTF.** Greenwood, L.R. (Pacific Northwest Lab., Richland, WA (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual*

progress report for the period ending March 31, 1994. 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron fluence and spectral measurements and radiation damage calculations have been revised for the MOTA-1A,1B experiments in the Fast Flux Test Facility (FFTF). The data were revised in order to correct for nuclear burnup effects for several of the radiometric monitors, thereby increasing the fluence and damage up to 20%, according to position in the MOTA assembly. The MOTA-1A experiment was irradiated from January 18, 1983 to October 23, 1983 for an exposure of 202.0 EFPD. MOTA-1B was irradiated from January 1, 1984 to April 23, 1984 for an exposure of 109.5 EFPD. Neutron fluence and dpa values are presented for both assemblies.

17202 (DOE/ER–0313/16, pp. 21-27) **Neutron dosimetry for the MOTA-2B experiment in FFTF.** Greenwood, L.R. (Pacific Northwest Lab., Richland, WA (United States)); Kellogg, L.S. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron fluence and spectral measurements and radiation damage calculations are reported for the (Materials Open Test Assembly) MOTA-2B experiment in the Fast Flux Test Facility (FFTF). The irradiation was conducted from May 27, 1991, to March 19, 1992 for a total exposure of 203.3 EFPD (effective full-power days). The maximum fluence was about 9 x 10^{22} n/cm^2, 6 x 10^{22} above 0.1 MeV producing about 24 dpa in iron. Neutron fluence and radiation damage maps are presented for the entire MOTA assembly based on the analysis of ten neutron spectral measurements and fourteen additional flux gradient measurements.

17203 (DOE/ER–0313/16, pp. 28-32) **Neutron dosimetry for the MOTA-1C experiment in FFTF.** Greenwood, L.R. (Pacific Northwest Lab., Richland, WA (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron fluence and spectral measurements and radiation damage calculations have been completed for the Materials Open Test Assembly (MOTA)-1C experiment in the Fast Flux Test Facility (FFTF). Although this irradiation was completed in 1985, the neutron dosimetry data were never analyzed. The MOTA-1C experiment was irradiated in cycles 5 and 6 from June 16, 1984 to June 24, 1985 for an exposure of 256.7 EFPD (effective full power days). The irradiation was conducted at 400 MW. Neutron fluence and dpa values are presented.

17204 (DOE/ER–0313/16, pp. 33-42) **Transmutations of elements under irradiation and its impact on alloys composition.** Gomes, I.C. (Argonne National Lab., IL (United States)); Smith, D.L. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract W-31109-ENG-38. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

This study presents a comparison of nuclear transmutation rates for candidate fusion first wall/blanket structural materials in available fission test reactors with those produced in a typical fusion spectrum. The materials analyzed in this study include a vanadium alloy (V-4Cr-4Ti), a reduced activation martensitic steel (Fe-9Cr-2WVTa), a high conductivity copper alloy (Cu-Cr-Zr), and the SiC compound. The fission irradiation facilities considered include the EBR-II (Experimental Breeder Reactor) fast reactor, and two high flux mixed spectrum reactors, HFIR (High Flux Irradiation Reactor) and SM-3 (Russian reactor). The transmutation and dpa rates that occur in these test reactors are compared with the calculated transmutation and dpa rates characteristic of a D-T fusion first wall spectrum. In general, past work has shown that the displacement damage produced in these fission reactors can be correlated to displacement damage in a fusion spectrum; however, the generation of helium and hydrogen through threshold reactions [(n,xα) and (n,xp)] are much higher in a fusion spectrum. As shown in this study, the compositional changes for several candidate structural materials exposed to a fast fission reactor spectrum are very low, similar to those for a characteristic fusion spectrum. However, the relatively high thermalized spectrum of a mixed spectrum reactor produces transmutation rates quite different from the ones predicted for a fusion reactor, resulting in substantial differences in the final composition of several candidate alloys after relatively short irradiation time. As examples, the transmutation rates of W, Ta, V, Cu, among others, differ considerably when the irradiation is performed under a mixed spectrum reactor's and fusion first wall's spectrum. Fast reactors (EBR-II) provide the only possibility for obtaining high damage rates without producing significant compositional effects in vanadium alloys, ferritic steels and copper alloys.

17205 (DOE/ER–0313/16, pp. 43-46) **Calculations to determine the feasibility of using a boron carbide shield for spectral tailoring in the HFIR for vanadium alloy irradiation-R.** Lillie, R.A. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

A neutron transport calculation has been performed to determine the feasibility of creating a shielded facility in the Be reflector of the HFIR. It was found that the B_4C provides satisfactory spectral tailoring to reduce production of Cr below the tolerance limit for Cr in the original alloys. The shield would have to be replaced after eight cycles or 5 dpa, but the operations schedule for the HFIR makes it easier to replace the shield after seven cycles. Three shields would then have to be used in order to reach 10 dpa. This facility would provide the equivalent of a low-temperature fast neutron position in the HFIR for development and preliminary qualification of vanadium alloys for fusion devices.

17206 (DOE/ER–0313/16, pp. 47-50) **Transmutation in copper-base brazing materials.** Garner, F.A. (Pacific Northwest Lab., Richland, WA (United States)); Greenwood, L.R.; Edwards, D.J. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Brazing compounds containing silver or gold will transmute during irradiation, forming significant amounts of either cadmium or mercury, respectively, in all neutron spectra of current interest to the fusion materials program. The impact of this transmutation on braze performance and on development of fission-fusion correlations has yet to be determined, but will be addressed in an irradiation experiment that was recently completed in FFTF-MOTA. A lesser amount of transmutation will occur in brazes containing tin, but no specimens containing brazes with tin have yet been irradiated.

17207 (DOE/ER–0313/16, pp. 53-56) **ITER material properties handbook.** Davis, J.W. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

In December the ITER Joint Central Team authorized the creation of a Materials Properties Handbook. This Handbook is a cooperative activity between the four parties of ITER (Japan, the E.U., the R.F., and the US). The US Home Team has been selected to coordinate the documentation, while all four Parties will provide data. During this period the effort focused on organizing this activity, developing a format for use by all of the parties, and demonstrating the ability to electronically transfer files between the four parties. First draft of the Handbook is scheduled for July.

17208 (DOE/ER–0313/16, pp. 61-79) **Void swelling in binary Fe-Cr alloys at 200 dpa.** Gelles, D.S. (Pacific Northwest Lab., Richland, WA (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Microstructural examinations have been performed on a series of binary Fe-Cr alloys irradiated in the FFTF/MOTA at 425°C to 200 dpa. The data represent the highest swelling levels reported in neutron irradiated ferritic alloys. The alloy compositions ranged from 3% to 18% Cr in 3% Cr increments, and the irradiation temperature corresponded to the peak swelling condition for this alloy

class. Density measurements showed swelling levels as high as 7.4%, with the highest swelling found in the Fe-9Cr and Fe-6Cr alloys. Microstructural examinations revealed that the highest swelling conditions contained well-developed voids, often as large as 100 nm, and a dislocation network comprised of both a/2<111> and a<100> Burgers vectors. Swelling was lower in the other alloys, and the swelling reduction could be correlated with increased precipitation. These results are considered in light of the current theories for low swelling in ferritic alloys, but no theory is available to completely explain the results.

17209 (DOE/ER–0313/16, pp. 80-107) **Data base on permeation, diffusion, and concentration of hydrogen isotopes in fusion reactor materials.** Brimhall, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Simonen, E.P.; Jones, R.H. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

In evaluating fusion reactor performance, knowledge about permeation, diffusion and concentration of hydrogen isotopes throughout the structure is of critical importance. The data base on hydrogen isotope permeation in relevant fusion reactor materials is reviewed in this report. Comparisons are made within alloys of the same type as well as with all the other classes of alloys. Both gas-driven permeation (GDP) and plasma-driven permeation (PDP) are included. Data on GDP behavior in Fe and Ni alloys are relatively consistent. In metals that have a high solubility and/or are hydride formers, e.g., V, Nb, Ti, there is much more variation in the data, and surface effects play a very dominant role. Permeation under plasma conditions is less well understood as more variables enter the relationship, e.g., reemission phenomena, internal concentration gradients, radiation effects, etc. The data show that materials do not necessarily rank in the same order under PDP conditions as under GDP conditions. A summary of the factors that influence permeation and the relative magnitude of their effect is given in the report.

17210 (DOE/ER–0313/16, pp. 111-127) **Development of low-chromium, chromium-tungsten steels for fusion.** Klueh, R.L. (Oak Ridge National Lab., TN (United States)); Alexander, D.J. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

High-chromium (9-12% Cr) Cr-Mo and Cr-W ferritic steels are favored as candidates for fusion applications. In the early work to develop reduced-activation steels, an Fe-2.25Cr-2W-0.25V-0.1C steel (designated 2 1/4Cr-2WV) had better strength than an Fe-9Cr-2W-0.25V-0.07Ta-0.1C (9Cr-2WVTa) steel (compositions are in weight percent). However, the 2 1/4Cr-2WV had less-than-adequate impact toughness, as determined by the ductile-brittle transition temperature and upper-shelf energy of a Charpy impact test. Because low-chromium steels have some advantages over high-chromium steels, a program to develop low-chromium steels is in progress. Microstructural analysis indicated that the reason for the inferior impact toughness of the 2 1/4Cr-2WV was the granular-bainite microstructure obtained when the steel was normalized. Properties can be improved by developing an acicular bainite structure by increasing the cooling rate after austenitization. Alternatively, acicular bainite can be promoted by increasing the hardenability. Hardenability was changed by adding small amounts of boron and chromium to the 2 1/4Cr-2WV composition. A combination of B, Cr, and Ta additions resulted in low-chromium reduced-activation steels with mechanical properties comparable to those of 9Cr-2WVTa.

17211 (DOE/ER–0313/16, pp. 128-141) **Microstructure-mechanical properties correlation of irradiated conventional and reduced-activation martensitic steels.** Klueh, R.L. (Oak Ridge National Lab., TN (United States)); Alexander, D.J.; Kai, Ji-Jung. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Tensile, Charpy, and transmission electron microscopy specimens of two conventional steels, modified 9Cr-1Mo (9Cr-1MoVNb) and Sandvik HT9 (12Cr-1MoVW), and two reduced-activation steels, Fe-9Cr-2W-0.25V-0.1C (9Cr-2WV) and Fe-9Cr-2W-0.25V-0.07Ta-0.1C (9Cr-2WVTa), were irradiated in the Fast Flux Test Facility. Before irradiation, $M_{23}C_6$ was the primary precipitate in all four steels, which also contained some MC. Neutron irradiation did not substantially alter the $M_{23}C_6$ and MC. No new phases formed during irradiation of the 9Cr-2WV and 9Cr-2WVTa, but chi-phase precipitated in the 9Cr-1MoVNb and chi-phase and α' precipitated in the 12Cr-1MoVW. Irradiation-produced dislocation loops were observed in 9Cr-2WV, 9Cr-2WVTa, and 12Cr-1MoVW. The irradiation-produced microstructural changes caused the steels to harden, as measured by the change in yield stress. Hardening was correlated with a change in the Charpy impact properties of 9Cr-1MoVNb, 12Cr-1MoVW, and 9Cr-2WV. Although irradiation caused a yield stress increase of the 9Cr-2WVTa similar to that for 9Cr-2WV and 9Cr-1MoVNb, the change in Charpy properties was considerably less for 9Cr-2WVTa. This difference in Charpy behavior of the 9Cr-2WVTa with that of the 9Cr-2WV and 9Cr-1MoVNb was attributed to differences in the fracture stress-temperature relationship and/or the flow stress-temperature relationship between the 9Cr-2WVTa and the other two 9Cr steels.

17212 (DOE/ER–0313/16, pp. 146-160) **Microstructural examination of commercial ferritic alloys at 200 dpa.** Gelles, D.S. (Pacific Northwest Lab., Richland, WA (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Microstructures and density change measurements are reported for Martensitic commercial steels HT-9 and Modified 9Cr-1Mo (T9) and oxide dispersion strengthened ferritic alloys MA956 and MA957 following irradiation in the FFTF/MOTA at 420°C to 200 DPA. Swelling as determined by density change remains below 2% for all conditions. Microstructures are found to be stable except in recrystallized grains of MA957, which are fabrication artifacts, with only minor swelling in the Martensitic steels and α' precipitation in alloys with 12% or more chromium. These results further demonstrate the high swelling resistance and microstructural stability of the ferritic alloy class.

17213 (DOE/ER–0313/16, pp. 173-193) **Fracture toughness of irradiated candidate materials for ITER first wall/blanket structures.** Alexander, D.J. (Oak Ridge National Lab., TN (United States)); Pawel, J.E.; Grossbeck, M.L.; Rowcliffe, A.F.; Shiba, K. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Candidate materials for first wall/blanket structures in ITER have been irradiated to damage levels of about 3 dpa at nominal irradiation temperatures of either 90 or 250°C. These specimens have been tested over a temperature range from 20 to 250°C. The results show that irradiation at these temperatures reduces the fracture toughness of austenitic stainless steels, but the toughness remains quite high. The toughness decreases as the test temperature increases. Irradiation at 250°C is more damaging than at 90°C, causing larger decreases in the fracture toughness. Ferritic steels are embrittled by the irradiation, and show their lowest toughness at room temperature.

17214 (DOE/ER–0313/16, pp. 194-201) **Low temperature radiation-induced segregation relative to IASCC and ITER.** Simonen, E.P. (Pacific Northwest Lab., Richland, WA (United States)); Jones, R.H.; Charlot, L.A.; Bruemmer, S.M. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation induced segregation at grain boundaries in stainless steel has been evaluated as a function of temperature. Segregation caused by ion irradiation was measured and compared to temperature-dependent model predictions. The model was subsequently used to extrapolate predictions to ITER operating

conditions. For ion irradiation, segregation was found to extend to temperatures below 400°C which implies that segregation is expected at temperatures less than 200°C for ITER irradiation damage rates. The model predictions were in accord with Cr depletion levels and profile widths as measured using FEG-STEM examination of ion irradiated grain boundaries. The model was further shown to be consistent with measured depletion levels at grain boundaries in 316 stainless steel irradiated in a light-water reactor at 288°C. The findings of this study suggest that chromium depletion and hence IASCC may be a concern for stainless steel structures irradiated in ITER high-temperature water environments.

17215 (DOE/ER–0313/16, pp. 204-211) **Swelling and structure of vanadium alloys irradiated in the dynamic helium charging experiment.** Chung, H.M. (Argonne National Lab., IL (United States)); Loomis, B.A.; Tsai, H.; Nowicki, L.; Gazda, J.; Smith, D.L. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract W-31109-ENG-38. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Combined effects of dynamically charged He and neutron damage on density change, void distribution, and microstructural evolution of V-4Cr-4Ti have been determined after irradiation to 18-31 dpa at 425-600°C in the Dynamic Helium Charging Experiment (DHCE). For specimens irradiated to ≈18 dpa at 600°C with an estimated He/dpa ratio of 3-9 appm He/dpa (a range similar to the fusion-relevant ratio of ≈5 appm He/dpa), only a few microvoids were observed at the interface of the grain matrix and some Ti(O,N,C) precipitates. No microvoids were observed either in the grain matrix or near grain boundaries. It seems that most of the dynamically produced He atoms are trapped in the grain matrix without significant void nucleation or growth. In this group of DHCE specimens, density changes were similar to those of non-DHCE (negligible He generation) specimens for a comparable fluence and irradiation temperature. Significant numbers of microvoids in the grain matrix and on localized grain boundaries were present only in specimens irradiated to ≈31 dpa at 425°C in high-tritium capsules, in which an excessive amount of helium was generated (estimated He/dpa ratio of 10-35 appm). Discontinuous regions of void segregation on grain boundaries were observed, and void number-density was significantly lower than in other alloys irradiated in tritium-trick experiments. Density changes of the specimens were significantly higher than those from non-DHCE irradiations. Microstructural evolution in V-4Cr-4Ti was similar for DHCE and non-DHCE irradiations, except for void number-density and distribution. As in non-DHCE specimens, irradiation-induced precipitation of ultrafine Ti_5Si_3 was observed for irradiation at 600°C but not at 425°C.

17216 (DOE/ER–0313/16, pp. 212-219) **Effect of dynamically charged helium on mechanical properties of V-4Cr-4Ti.** Chung, H.M. (Argonne National Lab., IL (United States)); Loomis, B.A.; Tsai, H.; Nowicki, L.; Busch, D.E.; Smith, D.L. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract W-31109-ENG-38. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

V-4Cr-4Ti has been reported to be virtually immune to irradiation embrittlement under conditions of negligible helium generation; DBTTs determined from one-third-size Charpy-impact specimens irradiated in a non-DHCE experiment were <−200°C. The effects of dynamically charged helium and tritium, and of neutron damage, on DBTT of the alloy were determined after irradiation in the Dynamic Helium Charging Experiment (DHCE). TEM disks irradiated to 18-31 dpa at 425-600°C were fractured by repeated bending in a low-temperature bath. Miniature specimens were used because no Charpy-impact specimens were included in the DHCE experiment. Ductile-brittle transition behavior was determined from quantitative SEM fractography. Brittle fracture surface morphology was not observed at >−120°C regardless of the level of dpa damage or helium and tritium content in the alloy. Predominantly brittle-cleavage fracture morphologies were observed only at −196°C in some specimens irradiated to 31 dpa at 425°C and in which the estimated helium and tritium contents were highest. This indicates a DBTT between −175 and −200°C in specimens containing the highest levels of dpa damage, helium, and tritium in the DHCE experiment. No intergranular fracture was observed.

17217 (DOE/ER–0313/16, pp. 220-224) **Status of the dynamic helium charging experiment.** Tsai, H. (Argonne National Lab., IL (United States)); Strain, R.V.; Chung, H.M.; Smith, D.L. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract W-31109-ENG-38. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Seven DHCE capsules containing vanadium-alloy specimens were irradiated in the MOTA-2B vehicle in FFTF to ≈20-29 dpa. In this and the previous reporting periods, equipment and procedures were developed at Argonne National Laboratory-East to disassemble these capsules. Six of the seven capsules have been disassembled. (The seventh capsule was processed in April 1994, immediately following this reporting period). Effluence of tritium into the cell exhaust was <2% of the total inventory. No contamination incidents occurred during the DHCE disassembly work. Initial testing of the retrieved specimens is under way.

17218 (DOE/ER–0313/16, pp. 240-243) **Chemical and mechanical interactions of interstitials in V-5%Cr-5%Ti.** DeVan, J.H. (Oak Ridge National Lab., TN (United States)); DiStefano, J.R.; Hendricks, J.W. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Gas-metal reaction studies of V-5Cr-5Ti were conducted to determine the kinetics of reactions with H_2 and O_2, respectively, at 400-500°C. Reaction rates were determined through weight change measurements and chemical analysis, and effects on mechanical properties were evaluated by room temperature tensile tests. Exposure to hydrogen at pressures between 10^{-4} to 10^{-2} torr lowered the tensile ductility in the case of coarse-grained specimens but had little effect on finer-grained specimens. Similarly oxygen uptake at 500°C, at concentrations as low as 200 ppm (by weight), significantly lowered the ductility of the coarser-grained but not the finer-grained material.

17219 (DOE/ER–0313/16, pp. 293-304) **Influence of transmutation on microstructure, density, change, and embrittlement of vanadium and vanadium alloys irradiated in HFIR.** Ohnuki, S. (Hokkaido Univ., Sapporo (Japan)); Takahashi, H.; Shiba, K.; Hishinuma, A.; Pawel, J.; Garner, F.A. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830 ; AC05-84OR21400. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Addition of 1 at.% nickel to vanadium and V-10Ti, followed by irradiation along with the nickel-free metals in HFIR to 2.3 x 10^{22}n cm^{-2}, E>0.1MeV (corresponding to 17.7 dpa) at 400°C, has been used to study the influence of helium on microstructural evolution and embrittlement. Approximately 15.3% of the vanadium transmuted to chromium in these alloys. The ~50 appm helium generated from the $^{58}Ni(n,\gamma)^{59}Ni(n,\alpha)^{56}Fe$ sequence was found to exert much less influence than either the nickel directly or the chromium formed by transmutation. The V-10Ti and V-10Ti-1Ni alloys developed an extreme fragility and broke into smaller pieces in response to minor physical insults during density measurements. A similar behavior was not observed in pure V or V-1Ni. Helium's role in determination of mechanical properties and embrittlement of vanadium alloys in HFIR is overshadowed by the influence of alloying elements such as titanium and chromium. Both elements have been shown to increase the DBTT rather rapidly in the region of 10% (Cr + Ti). Since Cr is produced by transmutation of V, this is a possible mechanism for the embrittlement. Large effects on the DBTT may have also resulted from uncontrolled accumulation of interstitial elements such as C, N, and O during irradiation.

17220 (DOE/ER–0313/16, pp. 305-308) **Influence of flux-spectra differences on transmutation and swelling of vanadium alloys.** Garner, F.A. (Pacific Northwest Lab., Richland, WA (United States)); Greenwood, L.R. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In

Fusion materials semiannual progress report for the period ending March 31, 1994. 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The swelling of vanadium and its alloys is known to be sensitive to the level of chromium in the alloy. Chromium is also the major transmutation product during neutron irradiation, however, and the production rate of chromium is very sensitive to neutron spectra. It appears that an apparent dependence of void swelling in pure vanadium irradiated in FFTF may arise in part from the spectral difference that accompanies changes in displacement rate.

17221 (DOE/ER–0313/16, pp. 309-312) **Dependence of vanadium alloy density on starting composition, transmutation and segregation.** Garner, F.A. (Pacific Northwest Lab., Richland, WA (United States)); Loomis, B.A. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The density of vanadium alloys is strongly dependent on solute identity and concentration, especially for additions of chromium and titanium. One consequence of this dependence is that radiation-induced density changes arise from segregation and precipitation. Transmutation of vanadium to chromium can also lead to significant increases in density and can therefore complicate somewhat the interpretation of swelling data derived using immersion density techniques.

17222 (DOE/ER–0313/16, pp. 314-341) **Copper alloys for high heat flux structure applications.** Zinkle, S.J. (Oak Ridge National Lab., TN (United States)); Fabritsiev, S.A. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The mechanical and physical properties of copper alloys are reviewed and compared with the requirements for high heat flux structural applications in fusion reactors. High heat flux structural materials must possess a combination of high thermal conductivity and high mechanical strength. The three most promising copper alloys at the present time are oxide dispersion-strengthened copper (Cu-Al_2O_3) and two precipitation-hardened copper alloys (Cu-Cr-Zr and Cu-Ni-Be). These three alloys are capable of room temperature yield strengths >400 MPa and thermal conductivities up to 350 W/m-K. All of these alloys require extensive cold working to achieve their optimum strength. Precipitation-hardened copper alloys such Cu-Cr-Zr are susceptible to softening due to precipitate overaging and recrystallization during brazing, whereas the dislocation structure in Cu-Al_2O_3 remains stabilized during typical high temperature brazing cycles. All three alloys exhibit good resistance to irradiation-induced softening and void swelling at temperatures below 300°C. The precipitation-strengthened alloys typically soften during neutron irradiation at temperatures above about 300°C and therefore should only be considered for applications operating at temperatures <300°C. Dispersion-strengthened copper may be used up to temperatures in excess of 500°C. Based on the available data, dispersion-strengthened copper (Cu-Al_2O_3) is considered to be the best candidate for high heat flux structural applications.

17223 (DOE/ER–0313/16, pp. 351-355) **Preparation of Russian copper alloy creep specimens.** Eiholzer, C.R. (Westinghouse Hanford Co., Richland, WA (United States)); Hamilton, M.L.; Barabash, V. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Eleven creep specimens of the Russian copper alloy MAGT-0.2 were pressurized and welded closed. The specimens were pressurized to levels ranging from 7.2 to 15.6 MPa (1052 to 2267 psia). These pressures will produce hoop stresses between 55 and 185 MPa (7,977 to 26,830 psia) when irradiated at 120°C.

17224 (DOE/ER–0313/16, pp. 356-363) **Void swelling of pure copper, Cu-5Ni and Cu-5Mn alloys irradiated with fast neutrons.** Watanabe, H.; Garner, F.A. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The effects of cold-work level and solute addition (nickel or manganese) on pure copper under fast neutron irradiation have been investigated. Neutron irradiation was conducted in the Fast Flux Test Facility (FFTF) at temperatures from 638 to 873K to doses ranging from 8 to 98 dpa. In pure copper, the void swelling behavior was investigated as a function of cold-work level. At 638 and 703K, 10% cold-work reduced swelling somewhat with little influence at higher cold-work levels. In comparison with pure copper, void swelling was suppressed by 5% nickel addition at 648K but slightly increased at 696K. Cu-5Mn resisted swelling in both annealed and 40% cold-worked specimens in all temperatures examined. At 648K, void formation was not detected. Only stacking fault tetrahedra were observed in this specimen.

17225 (DOE/ER–0313/16, pp. 364-367) **Influence of nickel and beryllium content on swelling of copper irradiated in COBRA-1A.** Garner, F.A. (Pacific Northwest Lab., Richland, WA (United States)); Singh, B.N. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

A series of annealed Cu-Ni dilute binary alloys were irradiated in COBRA-1A in EBR-II at temperatures of 373, 420 and 500°C. Density measurements have been performed for specimens irradiated at 373°C to 1.78 x 10^{22}n cm^{-2} (~11.3 dpa for pure copper). At this temperature and dose level nickel additions suppress swelling. There is a possible indication that some type of segregation-related phenomenon also occurs, yielding radiation-induced densification.

17226 (DOE/ER–0313/16, pp. 371-375) **Fabrication of aluminum nitride and its stability in liquid alkali metals.** Natesan, K. (Argonne National Lab., IL (United States)); Rink, D.L. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract W-31109-ENG-38. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

AlN has been selected as a prime candidate for electrically insulating the V-alloy first wall in the self-cooled ITER concept. Several methods are being evaluated for fabricating coatings that have adequate thickness and desirable physical, electrical, chemical, and mechanical properties. Coatings developed thus far are being exposed to liquid Li at 350 and 400°C.

17227 (DOE/ER–0313/16, pp. 376-381) **Development of electrical insulator coatings: In-situ electrical resistance measurements on CaO-coated V-5%Cr-5%Ti in liquid lithium.** Park, J.H. (Argonne National Lab., IL (United States)); Dragel, G.; Clark, R.W. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract W-31109-ENG-38. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The electrical resistance of CaO coatings produced on V-5%Cr-5%Ti by exposure of the alloy to liquid Li that contained 4 at.% dissolved Ca was measured as a function of time at temperatures of 250 to 698°C. The solute element, Ca in liquid Li, reacted with the alloy substrate at 420°C to produce a CaO coating. The resistance of the coating layer was ≈ 0.4 and 35.7 Ω at 267 and 698°C, respectively. Thermal cycling between 267 and 698°C changed the resistance of the coating layer, which followed insulator behavior. These results and those reported previously suggest that thin homogeneous coatings can be produced on variously shaped surfaces by controlling the exposure time, temperature, and composition of the liquid metal. This coating method is applicable to reactor components of various shapes (e.g., inside/outside of tubes, complex geometrical shapes) because the coating is formed by liquid-phase reaction. The liquid metal can be used over and over because only the solutes are consumed within the liquid metal.

17228 (DOE/ER–0313/16, pp. 385-391) **Performance of ceramic breeder materials in the SIBELIUS experiment.** Kopasz, J.P. (Argonne National Lab., IL (United States)); Johnson, C.E.; Baldwin, D.L. Oak Ridge National Lab., TN (United States). Sep

1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Lithium containing ceramics are among the leading candidates for use as tritium breeding materials in a fusion reactor. An issue affecting both the safety and economics of the reactor is the tritium inventory. The SIBELIUS experiment was designed to examine material compatibility between different components of a breeder blanket and to examine the tritium inventory in the components of the blanket. The tritium inventory in each of the ceramics was determined by measurements at end of life and were found to be quite low and in agreement with those determined in tests with no beryllium present. The inventory increased in the order lithium zirconate < lithium oxide < lithium orthosilicate < lithium aluminate with the inventory in the zirconate less than 0.03 wppm at 550°C.

17229 (DOE/ER–0313/16, pp. 392-405) **Ab initio calculations for hydrogen adsorption on lithium oxide surfaces.** Sutjianto, A. (Argonne National Lab., IL (United States)); Tam, S.W.; Curtiss, L.; Johnson, C.E.; Pandey, R. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The study of hydrogen chemisorption on the (110) and (111) lithium oxide surfaces have been investigated by means of ab initio Hartree-Fock calculations. In general, for the n-layer slab (where n = 2 and 3) of the neutral (110) and for the three-layer slab of the neutral (111) surfaces, there is no hydrogen chemisorption. The oxygen 2p band of the (110) surface is stabilized by the presence of more stacking sequences of layers which prevents charge transfer to the hydrogen. In the case of a neutral (110) layer due to low coordination of the anion, there is hydrogen chemisorption in the form of OH^- and $Li^+H^-Li^+$ with the chemisorption energy of 0.93 eV. For the neutral (111) surface, there is no hydrogen chemisorption since the oxygen layer is screened by the cation layers hindering the charge transfer to the hydrogen.

17230 (DOE/ER–0313/16, pp. 406-415) **Irradiation of lithium zirconate pebble-bed in BEATRIX-II, Phase II.** Verrall, R.A. (Chalk River Labs., Chalk River, Ontario (Canada)); Sullivan, J.D.; Slagle, O.D.; Hollenberg, G.W.; Kurasawa, T. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

BEATRIX-II was an in situ tritium recovery experiment that was designed to characterize the behavior of lithium ceramics irradiated to a high burnup, and to assess their suitability for use in a fusion reactor blanket. This paper describes the results from a vented canister containing lithium enriched lithium zirconate spheres (85% ^6Li) that were irradiated to a burnup of 5.2% (total lithium) in a steep temperature profile - 400°C edge, 1100°C center. The reference sweep gas was He-0.1%H_2, with systematic tests using alternate compositions: He-0.01%H_2 and pure He (maximum duration 8 days). Tritium recovery decreased slightly at lower H_2 concentrations. For example, the buildup of inventory during a 4-day test in pure He was 0.8 Ci which was approximately 6.5% of the tritium generated in the lithium zirconate during that period. The steadiness of the bed central temperature and the high tritium release rate, together with low moisture release rate, indicate good performance of the zirconate bed.

17231 (DOE/ER–0313/16, pp. 428-437) **Tensile behavior of irradiated SiC fibers.** Osborne, M.C. (Rensselaer Polytechnic Institute, Troy, NY (United States)); Steiner, D.; Snead, L.L. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC05-84OR21400 ; FG02-92ER54181. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Tensile results are presented for low oxygen Nicalon fibers neutron irradiated at damage levels of 0.013 displacements per atom (dpa), 0.13 dpa and 0.32 dpa. Single fibers were tensile tested and analyzed, using Weibull statistics, for mean strength and distribution. Tensile modulus was also determined. Using a diffractometer, the fiber grain size and percent crystallinity were determined. The mean strength and modulus decreased by 20% but then increased with the highest damage level tested. Both grain size and crystallinity decreased as dose increased. These initial results of low level neutron irradiation of low oxygen Nicalon fibers exhibit no substantial degradation of the properties investigated. Therefore, continued research at higher doses is recommended.

17232 (DOE/ER–0313/16, pp. 438-444) **Temperature dependence of the subcritical crack growth rate of a SiC/SiC composite.** Jones, R.H. (Pacific Northwest Labs., Richland, WA (United States)); Henager, C.H. Jr. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The long term stability of SiC/SiC composites is an issue regarding their use for fusion structural applications only because there is insufficient data to determine if there is really a problem. Crack growth measurements have been made over the temperature range of 800 to 1100°C, in high-purity Ar, to help assess the long term stability of these materials. Stage II crack growth rates ranging from 2×10^{-9} m/s at 1100°C down to 3×10^{-11} m/s at 800°C were found for a 2-D SiC/SiC composite reinforced with 40% Nicalon fibers. The Stage II velocities obeyed an Arrhenius relationship over this temperature range with an activation energy of 235 kJ/mol. At a fusion relevant temperature of 800°C, the crack velocity will result in a crack growth of 1 mm/yr. More creep resistant fibers are expected to reduce this crack growth amount to less than 1×10^{-2} mm/yr. at 800°C. This is not an excessive amount of crack extension for a material with a fracture toughness of about 20 MPa $m^{1/2}$.

17233 (DOE/ER–0313/16, pp. 445-458) **Defect energetics calculations of SiC using three representative empirical potentials.** Huang, Hanchen (Univ. of California, Los Angeles, CA (United States)); Wong, J.; Ghoniem, N.; Baskes, M. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract FG03-91ER54115 ; AC04-94AL85000. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Defect energetics is a critical issue not only for irradiation damage but also for semiconductor applications. Calculations of defect energetics rely mainly on using empirical potentials, which are developed based on information from equilibrium crystal configurations and which may not be suitable for investigating defected configurations. Therefore, not all potentials give accurate enough results. This paper first calibrates MEAM for silicon carbide. Calculations are then made for defect energetics of silicon carbide using the MEAM and two other representative empirical potentials. Results obtained with these potentials are compared with available first principal calculations and experimental data. The results not only provide more information for defect formation and migration in silicon carbide, but also provide a critical assessment of the three empirical potentials. The results are analyzed in terms of construction and calibration of the empirical potentials.

17234 (DOE/ER–0313/16, pp. 459-484) **Phenomenological inelastic constitutive equations for SiC and SiC fibers under irradiation.** El-Azab, A. (Univ. of California, Los Angeles, CA (United States)); Ghoniem, N.M. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental data on irradiation-induced dimensional changes and creep in β-SiC and SiC fibers is analyzed, with the objective of studying the constitutive behavior of these materials under high-temperature irradiation. The data analysis includes empirical representation of irradiation-induced dimensional changes in SiC matrix and SiC fibers as function of time and irradiation temperature. The analysis also includes formulation of simple scaling laws to extrapolate the existing data to fusion conditions on the basis of the physical mechanisms of radiation effects on crystalline solids. Inelastic constitutive equations are then developed for SCS-6 SiC fibers, Nicalon fibers and CVD SiC. The effects of applied stress, temperature, and irradiation fields on the deformation behavior of this class of materials are simultaneously represented. Numerical

results are presented for the relevant creep functions under the conditions of the fusion reactor (ARIES IV) first wall. The developed equations can be used in estimating the macro mechanical properties of SiC-SiC composite systems as well as in performing time-dependent micro mechanical analysis that is relevant to slow crack growth and fiber pull-out under fusion conditions.

17235 (DOE/ER–0313/16, pp. 485-492) **Tritium transport and retention in silicon carbide.** Tam, S.W. (Argonne National Lab., IL (United States)); Kopasz, J.; Johnson, C.E. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994*. 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

A theoretical framework describing trapping, diffusion and desorption of tritium from vapor-deposited β-silicon carbide has been proposed and an analytical version of this model was derived. This analytical model was used to extract trapping, diffusion, and desorption parameters from a limited part of the experimental data set. The resulting parameter-free model was then used to test its predictive capability by calculating the time-dependent release behavior for the high temperature regimes. General agreement with the release data was found supporting the suitability of the present approach. Tritium trapping was found to be strong. Both bulk diffusion and surface desorption make comparable contributions to tritium release from the silicon carbide. Improvements beyond the present analytical model to include dynamical detrapping can be achieved with the proposed framework.

17236 (DOE/ER–0313/16, pp. 517-522) **A comparison of the effect of radiation on the thermal conductivity of sapphire at low and high temperature.** White, D.P. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994*. 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

It has been proposed that sapphire be used in insulating feedthroughs and windows in radiofrequency and microwave heating systems in fusion reactors. The degradation of the thermal conductivity of sapphire with irradiation is a concern in the design of these windows. It has been proposed to cool microwave windows to liquid nitrogen temperatures to take advantage of the thermal conductivity peak, which occurs at approximately 30K in unirradiated sapphire, and the lower dielectric loss tangent at these temperatures. In this paper the methods used to calculate the thermal conductivity and the changes which occur with changes in point defect concentration will be reviewed and the results of the low temperature calculations will be compared to the high temperature calculations. It is found that vacancy scattering can significantly reduce the thermal conductivity over a wide temperature range; for example, a vacancy concentration of 0.01 per atom leads to a fractional change of about 90% at 77K versus 43% at 400K. This reduction has significance for the design and placement of radio frequency and microwave windows in fusion reactors.

17237 (DOE/ER/52143–T3) **Damage analysis and fundamental studies for fusion reactor materials development for the period March 1, 1991–February 28, 1994. Final report.** Odette, G.R.; Lucas, G.E. California Univ., Santa Barbara, CA (United States). Dept. of Chemical and Nuclear Engineering. Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-87ER52143. Order Number DE95008728. Source: OSTI; NTIS; INIS; GPO Dep.

The philosophy of the program at the University of California Santa Barbara has been to develop a fundamental understanding of both the basic damage processes and microstructural evolution that take place in a material during neutron irradiation and the consequent dimensional and mechanical property changes. This fundamental understanding can be used in conjunction with empirical data obtained from a variety of irradiation facilities to develop physically-based models of neutron irradiation effects in structural materials. The models in turn can be used to guide alloy development and to help extrapolate the irradiation data base to the fusion reactor regime. This philosophy is consistent with that of the national and international programs for developing structural materials for fusion reactors. During this period work has encompassed: (1) analysis of the degradation of the mechanical properties of austenitic stainless steels for the purpose of assessing the feasibility of using these steels in ITER; (2) examining helium effects on radiation damage in austenitic and ferritic stainless steels; (3) development and application of electropotential drop techniques to monitor the growth of cracks in steel specimens for a variety of specimen geometries (4) development of advanced methods of measuring fracture properties; (5) combining micromechanical modeling of fracture with finite element calculations of crack and notch-tip stress and strain fields to predict failure; (6) developing a data base on flow and fracture properties of ferritic steels. Each of these activities is described in more detail below and in greater detail in the attached publications.

17238 (ENEA-RT-ERG-FUS–93-35) **FTU collective scattering diagnostics: Scattering geometries, expected performances, antenna decoupling and detection requirements.** Orsitto, F.P. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Tartari, U. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Oct 1993. 37p. (RT/ERG-FUS–93-35). Order Number DE95771054. Source: OSTI; NTIS (US Sales Only).

The Collective Thomson Scattering (CTS) has been pointed out as a tool useful to measure the velocity distribution function of plasma ions: the present contains a proposal for an experimental program on the CTS for FTU (Frascati Tokamak Upgrade) where a 140 GHz ($lamda_0$=0.214 cm) gyrotron is used as main radiation source. The following arguments are examined: the concrete problems of the geometries interesting and feasible on FTU, i.e. the backscattering and the 30^0 scattering in the 'symmetric' configuration of the collecting and receiving antennas; the signal to noise ratio obtainable in that geometries, which results greater than 300; the figures of the antenna decoupling, which must be of the order of 80 dB, and the equivalent detection system temperature which must be around 10 eV.

17239 (ENEA-RT-ERG-FUS–94-01) **Electron-beam welding of grill flanges of FTU additional heating system.** Cucchiaro, A. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Marra, A. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Oct 1994. 12p. (CONF-9405291–2: 2. European conference on joining technology (Eurojoin-2), Florence (Italy), 16-18 May 1994; RT/ERG-FUS–94-01). Order Number DE95771036. Source: OSTI; NTIS (US Sales Only).

The research and development program of the fusion sector of ENEA (Italian Agency for New Technologies, Energy and Environment) Frascati center is mainly based on experiments on the Frascati Tokamak Upgrade (FTU) machine. The FTU is a medium-high magnetic field (8 T) tokamak with a radio-frequency (RF) additional heating system (8 MW, 8 GHz) that can heat the plasma to temperatures of fusionistic interest. The RF power is coupled to the plasma by a coupling structure consisting of three grills, each formed of an array of waveguides welded at the terminal flanges by an electron-beam technique. This solution allows highly accurate dimensions and optimum clean-surface conditions of the welded copper joints.

17240 (ENEA-RT-ERG-FUS–94-10) **Effect of argon injection on high Z impurity generation from poloidal inconel limiter in FTU.** Pieroni, L. (ENEA, Frascati (Italy). Centro Ricerche Energia); Franzoni, G.; Condrea, I. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Nov 1994. 20p. (RT/ERG-FUS–94-10). Order Number DE95771008. Source: OSTI; NTIS (US Sales Only).

Argon injection experiment on FTU (Frascati Tokamak Upgrade) plasma has been utilised to clarify the physical mechanism responsible for impurity production. A simple O-D model for the SOL (scrape off layer), coupled with sputtering by the main deuteron flux and self-sputtering can reproduce the variation of impurity concentration, Ni in the case of inconel limiter in FTU, when Argon is puffed into the plasma. The increase of radiation power losses leads to a decrease of the SOL temperature, and therefore to a decrease of the sputtering yield. Since Z_{eff} remains essentially unchanged by Ar puffing, a fraction of high Z impurity is substituted by Ar ions. As a consequence both the line radiation emission profile and the total radiation losses are modified, while all the other plasma parameters (temperature and density profiles, ohmic power and energy confinement time) remain unchanged. Radiation losses

increase up to 80% of the imput power, at relatively high densities, with a corresponding decrease of the heat load on the limiter surface.

17241 (GA-A–21757) **Optimized profiles for improved confinement and stability in the DIII-D tokamak.** Taylor, T.S. (General Atomics, San Diego, CA (United States)); St. John, H.; Turnbull, A.D. General Atomics, San Diego, CA (United States); Oak Ridge National Lab., TN (United States). Feb 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; AC05-84OR21400. (CONF-9406270–8: 21. EPS conference on controlled fusion and plasma physics, Montpellier (France), 27 Jun - 1 jul 1994). Order Number DE95009606. Source: OSTI; NTIS; INIS; GPO Dep.

Simultaneous achievement of high energy confinement, τ_E, and high plasma beta, β, leads to an economically attractive compact tokamak fusion reactor. High confinement enhancement, $H = \tau_E/\tau_{E-ITER89P} = 4$, and high normalized beta $\beta_N = \beta/(I/aB) = 6\%\text{-m-T/MA}$, have been obtained in DIII-D experimental discharges. These improved confinement and/or improved stability limits are observed in several DIII-D high performance operational regimes: VH-mode, high ℓ_i H-mode, second stable core, and high beta poloidal. The authors have identified several important features of the improved performance in these discharges: details of the plasma shape, toroidal rotation or ExB flow profile, q profile and current density profile, and pressure profile. From the improved physics understanding of these enhanced performance regimes, they have developed operational scenarios which maintain the essential features of the improved confinement and which increase the stability limits using localized current profile control. The stability limit is increased by modifying the interior safety factor profile to be non-monotonic with high central q, while maintaining the edge current density consistent with the improved transport regimes and the high edge bootstrap current. They have calculated high beta equilibria with $\beta_N = 6.5$, stable to ideal n = 1 kinks and stable to ideal ballooning modes. The safety factor at the 95% flux surface is 6, the central q value is 3.9 and the minimum in q is 2.6. The current density profile is maintained by the natural profile of the bootstrap current, and a modest amount of electron cyclotron current drive.

17242 (GA-A–21814) **Recent results from the DIII-D tokamak and implications for future devices.** Luxon, J.L. (General Atomics, San Diego, CA (United States)). General Atomics, San Diego, CA (United States); Oak Ridge National Lab., TN (United States); Lawrence Livermore National Lab., CA (United States); Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; AC05-84OR21400 ; W-7405-ENG-48 ; AC04-76DP00789. (CONF-940843–18: 18. European symposium on fusion technology, Karlsruhe (Germany), 22-26 Aug 1994). Order Number DE95009605. Source: OSTI; NTIS; INIS; GPO Dep.

Improvements to the DIII-D tokamak have led to significant new research results and enhanced performance. These results provide important inputs to the design of next generation divertor systems including the upgrade of the DIII-D divertor. The use of graphite for the plasma facing components and careful wall preparation has enabled the routine achievement of regimes of enhanced energy confinement. In elongated discharges, triangularity has been found to be important in attaining good discharge performance as measured by the product of the normalized plasma pressure and the energy confinement time, $\beta\tau_E$ This constrains the design of the divertor configuration (X-point location). Active pumping of the divertor region using an in-situ toroidal cryogenic pump has demonstrated control of the plasma density in H-mode discharges and allowed the dependence of confinement on plasma density and current to be separately determined. Helium removal from the plasma edge sufficient to achieve effective ash removal in reactor discharges has also been demonstrated using this pumping configuration. The reduction of the heat flux to the divertor plates has been demonstrated using two different techniques to increase the radiation in the boundary regions of the plasma and thus reduce the heat flux to the divertor plates; deuterium gas injection has been used to create a strongly radiating localized zone near the X-point, and impurity (neon) injection to enhance the radiation from the plasma mantle. Precise shaping of the plasma current profile has been found to be important in achieving enhanced tokamak performance. Transiently shaped current profiles have been used to demonstrate regimes of plasmas with high beta and good confinement. Control of the current profile also is important to sustaining the plasma in the Very High (VH)-mode of energy confinement.

17243 (GA-A–21957) **DIII-D power supply, design, and development.** Nerem, A. General Atomics, San Diego, CA (United States). Feb 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-9504138–1: International power electronics conference, Yokohama (Japan), 3-7 Apr 1995). Order Number DE95009603. Source: OSTI; NTIS; INIS; GPO Dep.

An overview of the DIII-D power supply system with information details concerning the configuration, power ratings, acquisition costs, and cost scaling relevant to the design of ITER and other tokamaks is presented. The power supplies for the DIII-D tokamak were installed and commissioned during the late 1970's and the beginning of the 1980's. Several upgrades have been implemented during the last two years to solve increasing reliability problems encountered as the equipment aged, to provide enhanced operational flexibilities, and to enable operation at the higher power levels needed to provide experimental data relevant to the ITER and TPX design activities. These upgrades ranged from redesign of the power supply control systems to the replacement of vacuum circuit breakers which had become unreliable in service. A new interlock and protection system has also been implemented using the latest programmable logic controllers (PLC) and computer technology. These upgrades have been highly successful and are described to provide insight to many issues in the specification of high power converters. Power supply models used in the design of the DIII-D Plasma Control System are also described along with model verification test data. These models are being used in the development of a new advanced plasma control system for the DIII-D tokamak. Recent operational experience and results are presented.

17244 (INDC(NDS)–316) **FENDL neutronics benchmark: Specifications for the calculational neutronics and shielding benchmark.** Sawan, M.E. (Wisconsin Univ., Madison, WI (United States). Fusion Technology Inst.). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Dec 1994. 12p. Order Number DE95629145. Source: OSTI; NTIS (US Sales Only); INIS.

During the IAEA Advisory Group Meeting on "Improved Evaluations and Integral Data Testing for FENDL" held in Garching near Munich, Germany in the period 12-16 September 1994, the Working Group II on "Experimental and Calculational Benchmarks on Fusion Neutronics for ITER" recommended that a calculational benchmark representative of the ITER design should be developed. This report describes the neutronics and shielding calculational benchmark available for scientists interested in performing analysis for this benchmark. (author).

17245 (INDC(NDS)–318) **FENDL activation benchmark: Specifications for the calculational activation benchmark.** Sawan, M.E. (Wisconsin Univ., Madison, WI (United States). Fusion Technology Inst.). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Dec 1994. 19p. Order Number DE95629146. Source: OSTI; NTIS (US Sales Only); INIS.

During the IAEA Advisory Group Meeting on "Improved Evaluations and Integral Data Testing for FENDL" held in Garching near Munich, Germany in the period 12-16 September 1994, the Working Group IV recommended that a calculational activation benchmark representative of the ITER design should be developed. This report gives detailed description and specifications for the calculational benchmark as well as the neutron flux and adjoint gamma flux. (author).

17246 (INDC(NDS)–319) **Comparison of activation cross section measurements and experimental techniques for fusion reactor technology. Summary report of the IAEA specialists' meeting held in St. Petersburg, Russia, 7 to 9 September 1994.** Pashchenko, A.B. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Feb 1995. 28p.

(CONF-9409333–: IAEA specialists' meeting on comparison of activation cross section measurement and experimental techniques for fusion reactor technology, St. Petersburg (Russian Federation), 7-9 Sep 1994). Order Number DE95629147. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains the Summary of the IAEA Specialists' Meeting on "Comparison of Activation Cross Section Measurements and Experimental Techniques for Fusion Reactor Technology". The meeting was organized by the IAEA Nuclear Data Section (NDS) with co-operation and assistance of local organizers from the V.G. Khlopin Radium Institute, KRI, and held in St. Petersburg, Russia, from 7 to 9 September 1994. The aim of the meeting was to discuss and evaluate the preliminary results of the researches carried out in the framework of the international programme on Comparison of Activation Cross Section Measurements and Experimental Techniques for Fusion Reactor Technology coordinated by the IAEA Nuclear Data Section and to identify further measurements and actions of participating laboratories. The detailed conclusions and recommendations of the meeting are presented in Attachment 1 of the summary report. It was confirmed that for further comparison of experimental techniques the experimental groups at JAERI (Tokai, Japan), KRI (St. Petersburg, Russia), IPPE (Obninsk, Russia) and IEP (Debrecen, Hungary) will join in a collaborative program on comparing their measurement techniques and do measurements for reactions where discrepancies between their previous measurements exist. In cases where the JAERI results are the only existing data or deviate strongly from previous measurements, collaboration between KRI, IEP, IPPE and other institutions can consider measurements of these cross sections in order to clarify the situation. (author).

17247 (INEL–95/0002) **Fusion Safety Program annual report, fiscal year 1994.** Longhurst, G.R.; Cadwallader, L.C.; Dolan, T.J.; Herring, J.S.; McCarthy, K.A.; Merrill, B.J.; Motloch, C.G.; Petti, D.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95008872. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the major activities of the Fusion Safety Program in fiscal year 1994. The Idaho National Engineering Laboratory (INEL) is the designated lead laboratory and Lockheed Idaho Technologies Company is the prime contractor for this program. The Fusion Safety Program was initiated in 1979. Activities are conducted at the INEL, at other DOE laboratories, and at other institutions, including the University of Wisconsin. The technical areas covered in this report include tritium safety, beryllium safety, chemical reactions and activation product release, safety aspects of fusion magnet systems, plasma disruptions, risk assessment failure rate data base development, and thermalhydraulics code development and their application to fusion safety issues. Much of this work has been done in support of the International Thermonuclear Experimental Reactor (ITER). Also included in the report are summaries of the safety and environmental studies performed by the Fusion Safety Program for the Tokamak Physics Experiment and the Tokamak Fusion Test Reactor and of the technical support for commercial fusion facility conceptual design studies. A major activity this year has been work to develop a DOE Technical Standard for the safety of fusion test facilities.

17248 (INIS-JP–028, pp. 71-73) **Irradiation effects on solid breeder materials of fusion reactor.** Nagae, Teruhito (Kyoto Univ. (Japan). Faculty of Engineering); Magari, Tadashi; Moriyama, Hirotake; Moritani, Kimikazu; Ito, Yasuhiko. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Irradiation defects are important for the tritium recovery performance of fusion reactor solid breeder materials under irradiation. In the present study, the production behavior of irradiation defects in Li_4SiO_4 and Li_2SiO_3 was studied by an in-situ luminescence measurement technique. Also, tritium recovery experiments were performed with neutron-irradiated Li_4SiO_4 and Li_2SiO_3 samples. Irradiation defects were observed to affect the tritium behavior. (author).

17249 (INIS-JP–029, pp. 57-59) **In situ observations of trapped deuterium in iron pre-bombarded with ^{3}He ions.** Matsuoka, Kotaro (Kyoto Univ. (Japan). Faculty of Engineering); Takagi, Ikuji; Fujita, Haruyuki; Higashi, Kunio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Experimental studies on radiation-induced traps for deuterium were conducted. Iron samples were pre-bombarded with 0.8-MeV ^{3}He ions and deuterium concentration was in-situ observed at elevated temperatures using the nuclear reaction $D(^3He,p)^4He$. The depth profiles of the trapped deuterium were similar to the distributions of the displaced host atoms. The trapping energy which is defined by a difference in the enthalpies between the trapped and the dissolved deuterium was 0.36eV. (author).

17250 (INIS-JP–029, pp. 72-74) **Study on performance of solid breeder materials of fusion reactor.** Magari, Tadashi (Kyoto Univ. (Japan). Faculty of Engineering); Nagae, Teruhito; Miyashita, Yousuke; Moritani, Kimikazu; Ito, Yasuhiko; Moriyama, Hirotake. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Irradiation defects are important for the tritium recovery performance of fusion reactor solid breeder materials under irradiation. In the present study, tritium recovery experiments were performed with neutron-irradiated Li_2SiO_3 and Li_4SiO_4 samples. Irradiation defects were observed to affect the tritium behavior on Li_2SiO_3 more than Li_4SiO_4 and most of the released tritium was recovered as condensable form, HTO. (author).

17255 (LA-UR–95-1057) **A self-assaying tritium storage bed for ITER.** Nasise, J.E.; Walthers, C.R.; Basinger, R.W. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950506–4: 5. topical meeting on tritium technology in fission, fusion and isotopic applications, Ispra (Italy), 28 May - 3 jun 1995). Order Number DE95009498. Source: OSTI; NTIS; INIS; GPO Dep.

A safe metal-hydride "self-assaying" tritium storage bed, featuring accurate tritium assaying measurements is being designed, built, and tested at the Tritium Systems Test Assembly (TSTA) at the Los Alamos National Laboratory (LANL) for the International Thermonuclear Experimental Reactor (ITER) program. Time consuming inventory operations can be shortened by utilizing "self-assaying" tritium storage beds. Design considerations, calculations, problems, and construction details of the bed are presented. Sensitivity, predictability, and simplicity are optimized in this design by utilizing thermal radiation as the primary mode of heat transfer. Thermal analysis calculations have shown that the design may provide 15 times the ITER required sensitivity at full capacity of 150 gT.

17256 (LA-UR–95-1089) **Demonstration of "regulatory" process controls on the TSTA cryogenic distillation system.** Willms, R.S.; Sherman, R.H.; Cole, S.P.; Riggs, J.B.; Okuno, K. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950506–5: 5. topical meeting on tritium technology in fission, fusion and isotopic applications, Ispra (Italy), 28 May - 3 jun 1995). Order Number DE95009494. Source: OSTI; NTIS; INIS; GPO Dep.

Due to the nature of its fusion reaction, most of the DT used to fuel the International Thermonuclear Experimental Reactor (ITER) will exit unreacted. This effluent will be purified by the fuel cleanup system so that the isotope separation system (ISS) will be fed only hydrogen isotopes and possibly some helium. The ISS will separate this feed into streams nominally composed of He/H2/HD, D2, DT, and T2. These products will be recycled through appropriate fueling systems back to the fusion reactor or returned to storage. The ISS will have to respond properly to feed conditions which change rapidly. Feed changes will propagate quickly through the entire cascade. It is apparent that an automatic control system will be required to respond to these changes and maintain product quality. It is convenient to divide such a distillation control system into 'regulatory' controls and composition controls. The 'regulatory' controls include liquid levels, flowrates, reboiler heats, and pressure. A system of regulatory controls has been devised and installed on the four-column cascade of cryogenic columns at the Tritium Systems Test Assembly (TSTA) at Los Alamos National Laboratory. This tritium-compatible ISS is designed for approximately 1/10 the ITER flowrate and is dedicated to fusion fuel studies. Details of the TSTA ISS have been published previously.

17257 (LA-UR–95-1110) **Basic science with pulsed power & some off-the-wall ideas.** Solem, J.C. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9504132–1: Spring workshop on basic science using pulsed power, Santa Barbara, CA (United States), 5-7 Apr 1995). Order Number DE95009486. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses aspects of pulsed power for use in basic research, with a principal emphasis on ATLAS, a planned 36-MJ pulsed-power machine with a circular architechture designed primarily for z-pinch implosion of cylindrical foils. The objective of the paper is to give an overview and touch on subjects which might test the limits of this technology.

17258 (NIFS-MEMO–14) **Proceedings of symposium on technology in laboratories (fiscal 1993) by department of engineering and technical services.** National Inst. for Fusion Science, Nagoya (Japan). Jul 1994. 327p. (In Japanese). (CONF-9403219–: Symposium on technology in laboratories, Toki (Japan), 23-24 Mar 1994). Order Number DE95768203. Source: OSTI; NTIS; INIS.

The Symposium on Technology in Laboratories was held on March 23 and 24 at Ceratopia Toki, and Toki Chamber of Commerce and Industry in Toki city, Gifu Prefecture, Japan. This symposium was hosted by National Institute for Fusion Science (NIFS). There were 273 participants from many Japanese universities and laboratories, from some Japanese industrial world. Seventy eight papers were presented in the symposium. Technical experience and new techniques were reported and discussed being divided into five sessions; technologies of fabrication, cryogenics, diagnostic and control system, computer and experimental apparatus. (author).

17259 (PNL-SA–25648) **Clean steels for fusion.** Gelles, D.S. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503118–1: Clean steel-supper clean steel conference, London (United Kingdom), 6-7 Mar 1995). Order Number DE95008939. Source: OSTI; NTIS; INIS; GPO Dep.

Fusion energy production has an inherent advantage over fission: a fuel supply with reduced long term radioactivity. One of the leading candidate materials for structural applications in a fusion reactor is a tungsten stabilized 9% chromium Martensitic steel. This alloy class is being considered because it offers the opportunity to maintain that advantage in the reactor structure as well as provide good high temperature strength and radiation induced swelling and embrittlement resistance. However, calculations indicate that to obtain acceptable radioactivity levels within 500 years after service, clean steel will be required because the niobium impurity levels must be kept below about 2 appm and nickel, molybdenum, nitrogen, copper, and aluminum must be intentionally restricted. International efforts are addressing the problems of clean steel production. Recently, a 5,000 kg heat was vacuum induction melted in Japan using high purity commercial raw materials giving niobium levels less than 0.7 appm. This paper reviews the need for reduced long term radioactivity, defines the advantageous properties of the tungsten stabilized Martensitic steel class, and describes the international efforts to produce acceptable clean steels.

17260 (PPPL-CFP–3205) **Tritium analysis at TFTR.** Voorhees, D.R.; Rossmassler, R.L.; Zimmer, G. Princeton Univ., NJ (United States). Plasma Physics Lab. [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-950506–6: 5. topical meeting on tritium technology in fission, fusion and isotopic applications, Ispra (Italy), 28 May - 3 jun 1995). Order Number DE95009625. Source: OSTI; NTIS; INIS; GPO Dep.

The tritium analytical system at TFRR is used to determine the purity of tritium bearing gas streams in order to provide inventory and accountability measurements. The system includes a quadrupole mass spectrometer and beta scintillator originally configured at Monsanto Mound Research Laboratory in the late 1970's and early 1980's. The system was commissioned and tested between 1991 and 1992 and is used daily for analysis of calibration standards, incoming tritium shipments, gases evolved from uranium storage beds and measurement of gases returned to gas holding tanks. The low resolution mass spectrometer is enhanced by the use of a metal getter pump to aid in resolving the mass 3 and 4 species. The beta scintillator complements the analysis as it detects tritium bearing species that often are not easily detected by mass spectrometry such as condensable species or hydrocarbons containing tritium. The instruments are controlled by a personal computer with customized software written with a graphical programming system designed for data acquisition and control. A discussion of the instrumentation, control systems, system parameters, procedural methods, algorithms, and operational issues will be presented. Measurements of gas holding tanks and tritiated water waste streams using ion chamber instrumentation are discussed elsewhere.

17261 (PPPL-CFP–3206) **Tokamak Physics Experiment (TPX) power supply design and development.** Neumeyer, C. (Raytheon Engineers and Constructors, Princeton, NJ (United States). EBASCO Div.); Bronner, G.; Lu, E.; Ramakrishnan, S. Princeton Univ., NJ (United States). Plasma Physics Lab. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-9504138–2: International power electronics conference, Yokohama (Japan), 3-7 Apr 1995). Order Number DE95009624. Source: OSTI; NTIS; INIS; GPO Dep.

The Tokamak Physics Experiment (TPX) is an advanced tokamak project aimed at the production of quasi-steady state plasmas with advanced shape, heating, and particle control. TPX is to be built at the Princeton Plasma Physics Laboratory (PPPL) using many of the facilities from the Tokamak Fusion Test Reactor (TFTR). TPX will be the first tokamak to utilize superconducting (SC) magnets in both the toroidal field (TF) and poloidal field (PF) systems. This new feature requires a departure from the traditional tokamak power supply schemes. This paper describes the plan for the adaptation of the PPPL/FTR power system facilities to supply TPX. Five major areas are addressed, namely the AC power system, the TF, PF and Fast Plasma Position Control (FPPC) power supplies, and quench protection for the TF and PF systems. Special emphasis is placed on the development of new power supply and protection schemes.

17262 (PPPL-CFP–3231) **Segmentation strategies for the irradiated and tritium contaminated PPPL TFTR.** Walton, G.R. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Litka, T.J.; Spampinato, P.T. Princeton Univ., NJ (United States). Plasma Physics Lab. 9 Feb 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-950414–1: American power conference, Chicago, IL (United States), 18-20 Apr 1995). Order Number DE95009626. Source: OSTI; NTIS; INIS; GPO Dep.

The Tokamak Fusion Test Reactor (TFTR) at Princeton Plasma Physics Laboratory is scheduled to complete its final experiments in the Fall of 1995. As a result, the TFTR will be activated and tritium contaminated. After the experiments are complete, the TFTR will undergo Shutdown and Removal (S and R). The space vacated by the TFTR will be used for a new test reactor, the Tokamak Physics Experiment (TPX). Remote methods may be required to remove components and to segment the Vacuum Vessel. The TFTR has been studied to determine alternatives for the segmentation of the Vacuum Vessel from the inside (In-Vessel). The methodology to determine suitable strategies to segment the Vacuum Vessel from In-Vessel included several areas of concentration. These areas were segmentation locations, cutting/removal technologies, pros and cons, and cutting/removal technology delivery systems. The segmentation locations for easiest implementation and minimal steps in cutting and removal have been identified. Each of these will also achieve the baseline for packaging and shipment. The methods for cutting and removal of components were determined. In addition, the delivery systems were conceptualized.

17263 (SAND–94-0282C) **Target diagnostics for intense lithium ion hohlraum experiments on PBFA II.** Leeper, R.J. (and others); Bailey, J.E.; Carlson, A.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940552–35: 10. topical conference on high-temperature plasma diagnostics, Rochester, NY (United States), 8-12 May 1994). Order Number DE95008517. Source: OSTI; NTIS; INIS; GPO Dep.

A review of the diagnostics used at Sandia National Laboratories to measure the parameters of intense lithium ion-beam hohlraum target experiments on PBFA II will be presented. This diagnostic package contains an extensive suite of x-ray spectral and imaging diagnostics that enable measurements of target temperature and x-ray output. The x-ray diagnostics include time-integrated and time-resolved pinhole cameras, energy-resolved I-D streaked imaging, diagnostics, time-integrated and time-resolved grazing, incidence spectrographs, a transmission grating spectrograph, an elliptical crystal spectrograph, a bolometer array, an eleven-element x-ray diode (XRD) array, and an eleven-element PIN diode detector array. The incident Li beam symmetry and an estimate of incident Li beam power density can be measured from ion beam-induced characteristic x-ray line emission and neutron emission.

17264 (SAND–95-0116) **Workshop on transport for a common ion driver.** Olson, C.C. (Sandia National Labs., Albuquerque, NM (United States)); Lee, E.; Langdon, B. Sandia National Labs., Albuquerque, NM (United States). [1994]. 447p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9409304–: Workshop on transport for a common ion driver, Albuquerque, NM (United States), 20-21 Sep 1994). Order Number DE95007298. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains research in the following areas related to beam transport for a common ion driver: multi-gap acceleration; neutralization with electrons; gas neutralization; self-pinched transport; HIF and LIF transport, and relevance to common ion driver; LIF and HIF reactor concepts and relevance to common ion driver; atomic physics for common ion driver; code capabilities and needed improvement.

17265 (UCRL–52000-94-12) **Energy & Technology Review, December 1994.** Bookless, W.A.; Wheatcraft, D. (eds.). Lawrence Livermore National Lab., CA (United States). Dec 1994. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE9501u261. Source: OSTI; NTIS; GPO Dep.

This issue of the review is devoted to articles on the proposed National Ignition Facility. This facility is proposed to achieve ignition via laser driven inertial confinement, and energy gain, for the first time in a laboratory plasma device. Separate articles from this issue have been indexed into the database.

17266 (UCRL-JC–116966) **Stability analysis of the TPX toroidal field coil.** Wong, R.L. Lawrence Livermore National Lab., CA (United States). 13 Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941013–33: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95009666. Source: OSTI; NTIS; INIS; GPO Dep.

The energy stability margin of the TPX/TF conductor has been calculated as a response to heat pulses with short initial quench zones and with long initial quench zones. The short IQZs approximate ramp-rate induced heating, and the long IQZs approximate heating from a plasma disruption. These IQZs are centered in the bore inner leg of the double pancake, where the operating field and temperature are maximum. Energy margin stability curves are plotted as a function of current. At the 33.5 kA design current, the minimum calculated stability margin with short IQZs is 390 mJ/cc. The minimum calculated stability margin with long IQZs is 205 mJ/cc. A comparison the stability margin with the available enthalpy (short IQZs) and with the available internal energy (long IQZs) shows that the conductor utilizes the available helium energy well. The energy margin stability curve is generally divided into two regions. The regions can be characterized on the basis of a decrease or an increase in heating after the initiating heat pulse during a marginal quench. The low current well-cooled region exists when the heating rate during the pulse is greater than the Joule heating after the pulse. Since the heating rate decreases, the energy margin is high. The high current ill-cooled region exists when the heating rate during the pulse is less than the Joule heating after the pulse. Since the heating rate increases, the energy margin is low. In the evaluation of a well-cooled or an ill-cooled condition, this Joule heating should be included in the strength of the initiating pulse. When this is done for the TPX/TF conductor, the limiting current approaches the critical current, explaining why the stability curves are entirely in the well-cooled region. The important result is that the conductor does not exhibit a large decrease in energy margin to an ill-cooled region until the current approaches the critical current.

17267 (UCRL-JC–119070) **The HYLIFE-II inertial fusion energy power plant concept and implications for IFE.** Moir, R.W. Lawrence Livermore National Lab., CA (United States). 4 Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941101–10: Meeting of the Division of Plasma Physics of the American Physical Society,

Minneapolis, MN (United States), 7-11 Nov 1994). Order Number DE95010561. Source: OSTI; NTIS; INIS; GPO Dep.

HYLIFE-II is based on nonflammable, renewable-liquid-wall fusion target chambers formed with Li_2BeF_4 molten-salt jets, a heavy-ion driver, and single-sided illumination of indirect-drive targets. Building fusion chambers from existing materials with life-of-plant structural walls behind the liquid walls, while still meeting non-nuclear grade construction and low-level waste requirements, has profound implications for IFE development. Fluid-flow work and computational fluid dynamics predict chamber clearing adequate for 6-Hz pulse rates. Predicted electricity cost is reduced about 30% to 4.4 cents/kWh at 1 GWe. Development can be foreshortened and cost reduced by obviating expensive neutron sources to develop first-wall materials. The driver and chamber can be upgraded in stages, avoiding separate and sequential facilities. The most important features of a practical inertial fusion power plant are sufficient ignition and gain in targets; a low-cost, efficient, repratable driver; and low-cost targets.

17268 (UCRL-JC–119584) **Can inertial electrostatic confinement work beyond the ion-ion collisional time scale?.** Nevins, W.M. Lawrence Livermore National Lab., CA (United States). Jan 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950170–2: DOE/EPRI workshop on the physics of spherical continuous inertial fusion, Santa Fe, NM (United States), 12-14 Jan 1995). Order Number DE95009530. Source: OSTI; NTIS; INIS; GPO Dep.

Inertial electrostatic confinement systems are predicated on a non-equilibrium ion distribution function. Coulomb collisions between ions cause this distribution to relax to a Maxwellian on the ion-ion collisional time-scale. The power required to prevent this relaxation and maintain the IEC configuration for times beyond the ion-ion collisional time scale is shown to be at least an order of magnitude greater than the fusion power produced. It is concluded that IEC systems show little promise as a basis for the development of commercial electric power plants.

17269 (UCRL-JC–120076) **Measurements of stability margins and current distribution in large-scale Nb_3Sn cable-in-conduit conductors.** Shen, S.S. (Lawrence Livermore National Lab., CA (United States). Applied Superconductivity Group); Isono, Takaaki. Lawrence Livermore National Lab., CA (United States). 7 Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9503127–2: 9. US/Japan workshop on high-field superconducting materials, Kyoto (Japan), 11-16 Mar 1995). Order Number DE95009869. Source: OSTI; NTIS; INIS; GPO Dep.

The main goal of the ITER Conductor Testing Program is to validate the design and the fabrication process of the CICC (Cable-In-Conduit Conductor) and its joints, in full-size samples. For testing large-scale cable-in-conduit conductors, several practical experimental techniques have been developed to specifically address the issues of conductor stability. The following described techniques enable experimentalists to quantify the effects and thus provide useful tools to improve the conductor performance in magnet applications. In this paper, the authors, present two experimental techniques: (a) stability margin calibration and (b) current distribution. Both are much needed in the laboratory for testing the conductor stability.

17270 (UCRL-LR–117512) **Reflectivity of plasmas created by high-intensity, ultra-short laser pulses.** Gold, D.M. Lawrence Livermore National Lab., CA (United States). Jun 1994. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009536. Source: OSTI; NTIS; GPO Dep.

Experiments were performed to characterize the creation and evolution of high-temperature ($T_e \sim 100eV$), high-density ($n_e > 10^{22} cm^{-3}$) plasmas created with intense ($\sim 10^{12}$-$10^{16} W/cm^2$), ultra-short (130fs) laser pulses. The principle diagnostic was plasma reflectivity at optical wavelengths (614nm). An array of target materials (Al, Au, Si, SiO_2) with widely differing electronic properties tested plasma behavior over a large set of initial states. Time-integrated plasma reflectivity was measured as a function of laser intensity. Space- and time-resolved reflectivity, transmission and scatter were measured with a spatial resolution of $\sim 3\mu m$ and a temporal resolution of 130fs. An amplified, mode-locked dye laser system was designed to produce ~3.5mJ, ~130fs laser pulses to create and nonintrusively probe the plasmas. Laser prepulse was carefully controlled to suppress preionization and give unambiguous, high-density plasma results. In metals (Al and Au), it is shown analytically that linear and nonlinear inverse Bremsstrahlung absorption, resonance absorption, and vacuum heating explain time-integrated reflectivity at intensities near $10^{16} W/cm^2$. In the insulator, SiO_2, a non-equilibrium plasma reflectivity model using tunneling ionization, Helmholtz equations, and Drude conductivity agrees with time-integrated reflectivity measurements. Moreover, a comparison of ionization and Saha equilibration rates shows that plasma formed by intense, ultra-short pulses can exist with a transient, non-equilibrium distribution of ionization states. All targets are shown to approach a common reflectivity at intensities $\sim 10^{16} W/cm^2$, indicating a material-independent state insensitive to atomic or solid-state details.

Source: OSTI; NTIS; INIS.

Since the JT-60 Upgrade (JT-60U) has a toroidally continued vacuum vessel with the small toroidal resistivity of 160 $\mu\Omega$, a large toroidal eddy current was predicted during disruptions. The toroidal current was measured directly and the behavior of the plasma and the eddy current were studied in the current quench phase. In the current quench phase, the fastest current decay is $Ip/(dIp/dt)_{MAX} \approx 5$ ms. The maximum toroidal eddy current is ≈40% of the plasma current which fits the design value and it increases linearly with Ip. Maximum total electromagnetic force of the vacuum vessel was radially 750 tons and vertically 120 tons with the inward motion of plasma in a 4MA disruption. The vibration of the vacuum vessel was measured during disruptions to estimate the electromagnetic forces and the stress of the vacuum vessel. The maximum amplitude of the vessel vibration increases with Ip^2. From this scaling, an amplitude at 6 MA disruption is expected to be 1.3 mm that is within the design limit of 2 mm. The poloidal halo current was observed at the simulation of the vertical displacement event. The time evolution of the halo current is consistent the estimated poloidal voltage produced by the plasma motion. The halo current increases with Ip and seems to increase with B_T. The maximum rate of halo current reaches ≈60% of the initial plasma current in the case of 1 MA disruption. The electromagnetic force due to halo current is ≈150 tons for vacuum vessel and ≈60kg for divertor tile. (author).

Source: OSTI; NTIS; INIS.

Estimation of electromagnetic force on coils and structural analyses by finite element method have been carried out for the Large Helical Device, which is a heliotron/torsatron-type fusion experimental device under construction. It has one pair of superconducting helical coils and three pairs of superconducting poloidal coils. The electromagnetic forces loaded on the coils are in the order of 10 MN/m. Accuracy of the position of the coils is very

important for the helical device to realize good magnetic configuration. All coils, therefore, are firmly fixed to a cylindrical supporting structure. In order to suppress the error field within $1x10^{-4}$ of the central toroidal field, it was provided that the asymmetric deformation of each coil caused by electromagnetic force should be within 3.4 mm for 4 T operation. After reformation of the thickness and the shape of the supporting structures according to the results of rough structural analyses, the detailed structural analysis with considering the rigidness of poloidal coils has been carried out. The maximum displacement of the supporting structures is calculated to be 2.39 mm. The maximum stress intensity is calculated to be 264 MPa. These satisfy allowable values. (author).

The design of the in-vessel components requires the verification of their structural thermal/mechanical and nuclear performances, and the validation of the solution of support systems to the vessel. But, the transient electromagnetic (EM) loads, caused by rapid variation of magnetic fields, e.g. during disruptions, in these structures surrounding the plasma ring, represent significant design factors. One of the major issues in fusion with magnetic confinement remains the study of these EM forces. The TESLA Laboratory of the JRC Ispra contributes, both theoretically and experimentally, to the European studies for the technical feasibility and acceptability of next step, e.g. ITER, and the commercial fusion reactors. The present paper describes the recent research and development (R and D) activities with regard to magnetomechanical behaviour of shield/blanket structures. (author).

FELIX is an experimental test facility at Argonne National Laboratory (ANL) for the study of electromagnetic effects in first wall, blanket, shield systems of fusion reactors. From 1983 to 1986 five major test series, including static and dynamic tests, were conducted and are reviewed in this paper. The dynamic tests demonstrated an important coupling effect between eddy currents and motion in a conducting structure. Recently the U.S. has proposed to the ITER Joint Central Team to use FELIX for testing mock-up components to study electromagnetic effects encountered during plasma disruptions and other off-normal events. The near and long term plans for ITER applications are discussed. (author).

Source: OSTI; NTIS; INIS.

Structure and features of three codes (NAPS, PROTEUS and CARIDDI) developed for design and analysis related to electromagnetic transients and plasma engineering are briefly reviewed. Some applications concerning first wall and blanket are presented, and general conclusions regarding the engineering and modelling of these components are drawn. (author).

17276 (UTNL-R–0302, pp. 69-79) **Numerical study on effect of magnetic field direction on flow behavior of metal melted by high heat flux.** Teramoto, Tokuo (Tsukuba Univ., Ibaraki (Japan)); Nagai, Takahiro; Ishiguro, Hiroshi. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

On plasma disruption a huge electromagnetic force is mechanically applied to the first wall etc. since the high eddy current is generated through vanishing of poloidal magnetic field. Besides, the first wall can be melted in part by high heat flux irradiation and the melted zone created is affected by the strong magnetic field. In the present paper, as actual case, it is investigated how a direction of applied magnetic field affects the development, the flow behavior and the temperature distribution of melted zone. An attempt is also made to correlate the flow behavior with magnetic field parameter. The following results are obtained. (1) The flow pattern in the melted zone is non-symmetric about center axis if the magnetic field is applied in a diagonal direction. This aspect is surely observed for a strong magnetic field. (2) The configuration of the melted zone by an application of weak magnetic field is close to that due to non-magnetic field while the configuration by an application of strong magnetic field is almost same as that due to heat conduction alone, i.e., neglect of convection. Both configurations, however, seem to be independent of applied direction. (3) In the case of weak magnetic field, the distributions of surface velocity and surface temperature are mostly dependent on applied direction while, in the case of strong magnetic field, they are not much affected by applied direction. (4) After a short time after high heat flux irradiation, the maximum surface velocity is inversely proportional to the square of the Hartmann number expressed in term of vertical component of magnetic field. (J.P.N.).

17277 (UTNL-R–0302, pp. 161-168) **Experimental and numerical analyses for effects of ferromagnetic material.** Tsuchimoto, M. (Hokkaido Univ., Sapporo (Japan). Faculty of Engineering); Oohira, T.; Hashimoto, M.; Takagi, T.; Miya, K. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. Source: OSTI; NTIS; INIS.

In strong and fluctuating magnetic field of a fusion reactor, ferromagnetic material receives magnetic body force as a result of magnetization. Experimental and numerical studies are explained to evaluate effects of ferromagnetic material. The magnetic torque for a ferromagnetic beam plate is analyzed for a ferromagnetic first wall. Iron loss and mechanical vibrations are also investigated for a ferromagnetic thin plate. (author).

structures surrounding the fusion plasma torus. 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

The choice of a martensitic steel (MANET) as the best candidate for the Demo blanket structural material entails a critical issue concerning its behaviour in presence of electromagnetic fields. In fact, MANET is a ferromagnetic material with a nonlinear magnetic behaviour followed by saturation of the magnetization. Its presence near the plasma region alter the distribution of the magnetic fields inside and outside the blanket structure in such a way that during a plasma disruption, as eddy currents are induced in the blanket structure, strong electromagnetic forces rise, which could seriously damage the blanket. A code which accounts for the presence of a saturated magnetic blanket structural material is being developed. It consists of a three dimensional program based on an integral volume method and using edge and constant elements for the calculation of eddy current and magnetization respectively. Analytical and numerical approach of the code are presented as well as the results of calculations performed for the KfK BOT Solid Breeder Blanket. (author).

17279 (UTNL-R–0302, pp. 189-200) **Fracture mechanics assessment of the Karlsruhe DEMO Blanket during plasma disruptions.** Boccaccini, L.V. (Kernforschungszentrum Karlsruhe GmbH (Germany). Institut fuer Neutronenphysik und Reaktortechnik). Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

The martensitic steel MANET has been chosen as structural material for the Karlsruhe DEMO Blanket Design. The main reason for this choice was that MANET is able to withstand the high neutron fluence in DEMO (70 d.p.a.) without swelling appreciably. Nevertheless, the fracture toughness behaviour of the material degrades considerably under irradiation especially at irradiation temperatures less than 400degC. As the minimum operating temperatures of the blanket structural material are just in the range between 300degC and 400degC, it is necessary to calculate the effects of plasma disruptions, in which a large amount of mechanical energy is discharged in few milliseconds into the blanket structure. The present paper shows procedures and results of a fracture mechanics assessment for the Karlsruhe Demo Solid Breeder Blanket Design. Local stress intensity factors K_I have been calculated for a first wall section in which the stresses are the highest. Comparing the K_I with the dynamic fracture toughness of the irradiated material, a critical crack dimension of 2.2 mm has been calculated. (author).

17280 (UTNL-R–0302, pp. 201-209) **Influence of static magnetic field on fatigue life.** Misumi, Masaaki (Seikei Univ., Musashino, Tokyo (Japan)); Ohkubo, Masafumi. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

The crack growth rate in a central notched carbon steel plate was not affected by static magnetic field under cyclic tension fatigue, but under reversed torsional fatigue some decrease of fatigue life was clearly observed in a static magnetic field for carbon steel bar. The decrease of fatigue life changed with specimen configuration, temperature, shear stress amplitude, specimen support condition. The additional tensile stress which gave almost same decrease of torsional fatigue life in the magnetic field was confirmed experimentally to be 20-50 MPa. The magnetostriction of tested steel was shrinkage in the longitudinal direction and elongation in the circumferential direction, and the volume magnetostriction was zero in this experimental condition. Some shift of fracture appearance to that of higher stress level were observed in a magnetic field: it would suggest a shear stress increase by the magnetic moment due to the Wertheim effect in which a circumferential magnetic field appears in a longitudinally magnetized bar when twisted. (author).

17281 (UTNL-R–0302, pp. 231-242) **Research on structural design guideline for the experimental fusion reactor.** Miya, K. (Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab.); Muto, Y.; Takatsu, H.; Hada, K.; Aoto, K.; Shiraishi, H.; Shimakawa, T. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

Research works to prepare a structural design guideline have been conducted based on the CDA-design of ITER. Though many further discussions are necessary, the present interim contents were described as follows. (1) Tritium boundary structures and the structures mitigating the effect of tritium-release accident are classified into a fusion class 1, which corresponds to the classes 3 or 4 in the Notification No.501. (2) Concerning the calculation of EM force, mesh generation associated with the skin effect and dynamic effect are major issues. (3) A simplified finite element model for the seismic calculation was presented. (4) Probable failure modes were listed up. (5) Concerning the issue of low ductility of 316 SS due to the irradiation, experiments to examine the validity of tearing modulus criterion, analytical methods to examine the applicability of the stress basis allowable stress limits to such a material were introduced. (6) The subjects related to the structural integrity evaluation for the EM loading such as the values of fracture toughness and the stress classification were described. (7) The results of analyses to develop simplified analysis methods for the buckling of the torus vacuum vessel under the outer pressure and for the buckling of rectangular bellows under the internal/external pressure were shown. (8) Concerning welding and nondestructive tests, issues pertaining to the vacuum vessel, blanket and divertor cooling tube were discussed. (J.P.N.).

17282 (UTNL-R–0302, pp. 243-250) **Application of shape memory alloy to a fusion structure component. A proposal of intelligent material system.** Furuya, Y. (Tohoku Univ., Sendai (Japan). Faculty of Engineering); Takagi, T.; Matsumoto, M.; Tani, J. Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1993. (CONF-9309405–: 2. international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus, Tokai (Japan), 15-17 Sep 1993). In *Proceedings of the 2nd international workshop on electromagnetic forces and related effects on blankets and other structures surrounding the fusion plasma torus.* 291p. Order Number DE94792667. Source: OSTI; NTIS; INIS.

1. We have proposed a new material structure system for use as structure components of a magnetic fusion reactor. (a) This system is composed of metal matrix and shape memory alloy (SMA) fiber. (b) Because of intelligent properties of SMA, this material could be an adaptive structure component against a plasma disruption. 2. In order to utilize this system as fusion structure components, the following items should be clarified: (a) High performance SMA, (b) Fabrication technique, (c) Compatibility with metal matrix, (d) Neutron irradiation, (e) Material properties, (f) Mechanical behavior. (J.P.N.).

Headquarters Procurement Operations. Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010696. Source: OSTI; NTIS; GPO Dep.

This booklet contains a listing of the Office of HQ Procurement Operations prime contractors required to implement a subcontracting plan in accordance with Public Law 95-507. It is intended to highlight potential subcontracting business opportunities for small business, small disadvantaged business, and woman-owned business firms.

17287 (DOE/IG–0369) **Report on inspection of Los Alamos National Laboratory's system for controlling cost overruns on work-for-others projects.** USDOE Office of Inspector General, Washington, DC (United States). Mar 1995. 28p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The Office of Inspector General previously issued Report No. DOE/IG-0335, "Report on Inspection of Selected Intelligence and Special Access Program Work-for-Others Projects". In this report, the authors noted that Los Alamos National Laboratory had internal control weaknesses involving work-for-others projects. Because of these weaknesses and the Department's continued interest in work-for-other Federal agencies, the authors initiated this inspection. this particular inspection reviewed Los Alamos National Laboratory's for controlling cost overruns on, and ensuring financial integrity of, work-for-others projects. The authors also reviewed Albuquerque Operations Office's implementation of internal processes for monitoring costs and ensuring financial integrity for these work-for-others projects.

17288 (DOE-STD–7501-95) **Development of DOE lessons learned programs.** USDOE, Washington, DC (United States). May 1995. 47p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011501. Source: OSTI; NTIS; GPO Dep.

Objective is to open lines of communication between DOE effective lessons-learned programs with minimal impact to existing processes and methods. Since the technical standard uses existing communication links, impact to resources should be minimal. Purpose of developing "lessons learned" is to share and use information to promote recurrence of desirable activities, or to preclude recurrence of undesirable activities. This technical standard is designed to facilitate the sharing of information in a consistent manner across the DOE complex.

The document reproduces the twenty-seven resolutions adopted and the fourteen other decisions taken by the IAEA General Conference at its thirty-seventh (1993) regular session. The resolutions are preceded by the agenda for the session.

17290 (HHS-CFR-B–7) **The development of risk acceptance and moral valuation.** Sjoeberg, L. (Stockholm School of Economics, Center for Risk Research, Stockholm (Sweden)); Torell, G. Stockholm School of Economics (Sweden). Center for Risk Research. Dec 1991. 21p. Order Number DE95627111. Source: OSTI; NTIS; INIS.

The relationship between acceptability of risk and moral valuation of risky activities was investigated in children, 10-16 years old. It was found that all age groups exhibited a strong correlation between the two dimensions of risky activities. Older children were more tolerant of risk taking than younger children. Individual actions were judged in a more lenient manner than collective actions. Girls tended to be more morally condemning towards risk taking, but the youngest girls were not less prone to accept risks than boys. General measures of moral development according to Piaget and Kohlberg were not associated with perceived acceptability of risk or the judged morality of risky activities but relations were found between risk taking and assertiveness and perceived freedom, which were the most important factors in accounting for risk and morality attitudes. 22 refs, 9 figs, 4 tabs.

17291 (HHS-CFR-B–8) **Center for risk research: A review of work 1988-1991.** Sjoeberg, L. Stockholm School of Economics (Sweden). Center for Risk Research. Jan 1992. 13p. Order Number DE95627112. Source: OSTI; NTIS; INIS.

This report gives a summary of the research published during the first 4 years of the Center for Risk Research at the Stockholm School of Economics. Risk research carried out so far at the Center has been concerned with mapping of attitudes and risk perceptions with regard to nuclear risks, AIDS, military flight risks, and economic risks. There has also been some methodological work and some work on the relationship between risk perception and interests.

17292 (IAEA-SM–317/12) **PCARRD's strategies for technology transfer: The agriculture and resources regional technology information system and the regional applied communication program.** Stuart, T.H. (Philippine Council for Agriculture, Los Banos, Laguna (Philippines). Forestry and Natural Resources); Mamon, C.R. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 20p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628891. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the Agriculture and Resources Regional Technology Information System (ARRTIS) and the Regional Applied Communication Outreach Program (RAC) of PCARRD. The ARRTIS and the RACO are the strategies in communicating scientific and technology-based information. The ARRTIS is an information system that provides an information base on the status of technologies at various levels of maturity (generation, adaptation, verification, piloting, dissemination and utilization) and offers technology alternatives based on environmental requirements, costs and returns analysis or feasibility of the technologies. This information base provides the repository of technology information from which the Applied Communication Program draws its information for packaging into various formats, using various strategies/media to cater to various users in the regions most especially the farmers. Meanwhile, as PCARRD executes its mission of developing the national research system, it incorporates a development support communication program through the RACO. The RACO is essentially a working component of a regional research center/

consortium in each region coordinated by the Applied Communication Division of PCARRD. It aims at reaching farmers and their families, extensionists, administrators, policy makers and entrepreneurs with research information and technology which use a variety of appropriate communication channels, modern communication technology and strategies so that they may actively participate in research diffusion and utilization. (author). 7 refs.

17293 (IAEA-SM–317/16) **Multilingual access to full text databases.** Fluhr, C. (Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France)); Radwan, K. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 11p. (In French). (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628893. Source: OSTI; NTIS (US Sales Only); INIS.

Many full text databases are available in only one language, or more, they may contain documents in different languages. Even if the user is able to understand the language of the documents in the database, it could be easier for him to express his need in his own language. For the case of databases containing documents in different languages, it is more simple to formulate the query in one language only and to retrieve documents in different languages. This paper present the developments and the first experiments of multilingual search, applied to french-english pair, for text data in nuclear field, based on the system SPIRIT. After reminding the general problems of full text databases search by queries formulated in natural language, we present the methods used to reformulate the queries and show how they can be expanded for multilingual search. The first results on data in nuclear field are presented (AFCEN norms and INIS abstracts). 4 refs.

17294 (IAEA-SM–317/17) **European Community initiatives and experience in scientific and technical information.** Steven, G. (Commission of the European Communities, Luxembourg (Luxembourg)). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 9p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628894. Source: OSTI; NTIS (US Sales Only); INIS.

Scientific and technical information (STI) is an increasingly important resource for R and D and industrial development. The rapid development of the market for electronic information and the increasing potential offered through new information technologies require new approaches for the collection and dissemination of STI. Activities of the Commission of the European Communities (CEC) in this area are reviewed. More recent CEC initiatives in the areas of biotechnology information and factual materials data banks have proved the need for international collaboration and for the implementation of infrastructural measures as a basis for such collaboration. The implementation of the EC Demonstrator Programme on materials property data systems has evaluated the potential of eleven European materials data banks against the market requirements and has helped to launch wide international collaboration. The concluding European workshop on materials data systems has developed a set of recommendations for future initiatives. These are shortly reviewed together with initial findings of a study aimed at developing a business plan for the establishment of a biotechnology information infrastructure for the bio-industries and research base in Europe. 17295 (IAEA-SM–317/20) **The online age and the agricultural user education.** Yousif-Aballi, A.F. (Scientific Research Council, Baghdad (Iraq). Scientific Affairs Office). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 10p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628895. Source: OSTI; NTIS (US Sales Only); INIS.

Accelerated developments in the computer and telecommunication technologies have been well exploited in production and provision of information to meet needs of different groups of agricultural user population; however, in developing countries topmost computerized agricultural scientific and technical services available serve groups who by profession are scientists and academics. User education became of crucial importance for optimum utilization of information. General user educational requirement, particular user response and problems, information resources, services, and available facilities were taken into consideration in designing an information service training course for agricultural researchers, a detailed outline of the course is given in this paper as well as trainees and trainers evaluation. (author). 6 refs.

17296 (IAEA-SM–317/21) **Computerized integrated data base production system (COMPINDAS).** Marek, D. (Fachinformationszentrum Karlsruhe, Gesellschaft fuer Wissenschaftlich-Technische Information mbH, Eggenstein-Leopoldshafen (Germany)); Buerk, K. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 19p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628896. Source: OSTI; NTIS (US Sales Only); INIS.

Based on many years of experience, and with the main objective in mind to guarantee long-term database quality and efficiency of input processes, Fachinformationszentrum Karlsruhe is developing an integrated interactive data management systems for bibliographic and factual databases. Its concept includes the following range of applications: Subject analysis with computer-assisted classification, indexing and translation; technical procedures with online acquisition and management of literature and factual data, recording by means of optical scanning, computer-assisted bibliographic description, control and update procedures; support of the whole process by continuous surveillance of document flow. All these procedures will be performed in an integrated manner. They system is to meet high standards for flexibility, data integrity and effectiveness of system functions. Independent of the type of data, the appropriate database or the subject field to be handled, all data will be stored in one large pool. One main goal is to avoid duplication of work and redundancy of data storage. The system will work online, interactive and conversational. COMPINDAS is being established on the basis of the ADABAS as database management system for storage and retrieval. The applications are being generated by means of aDis of ASTEC in Munich. aDis is used for the definition of the data structures, checking routines, coupling processes, and the design of dialogue and batch routines including masks. 17297 (IAEA-SM–317/23) **Industrial and technological information. Who has it and who needs it? The role of NTIS in acquisition and dissemination.** Khan, A.R. (National Technical Information Service (NTIS), Springfield, VA (United States). Office on International Affairs); Carroll, B.C. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 19p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628897. Source: OSTI; NTIS (US Sales Only); INIS.

Worldwide access to the results of research and development is critical for the effective advancement of science and its application. The U.S. National Technical Information Service (NTIS) has as its mission the collection and dissemination of scientific and technical

information (STI) produced worldwide, in order to increase U.S. competitiveness in the global economy. However, because of the interconnectedness of the world of science, NTIS also plays an important role in the world STI infrastructure. The paper describes the general STI transfer process, discusses the generators, products and services, and users of STI, and talks about the types of programs that have evolved to facilitate this process. The technical Report is highlighted as a significant information product. Finally, some future directions for NTIS to help meet the needs of users and acquire information more effectively are noted. In conclusion, the benefits and requirements for international cooperation and reciprocity are cited as cornerstones in building an effective worldwide STI infrastructure. (author). 7 figs.

17298 (IAEA-SM–317/27) **Structure and representation of data elements on factual database - SIST activity in Japan.** Nakamoto, H. (Integrated Researches for Information Science, Tokyo (Japan)); Onodera, N. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 7p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628898. Source: OSTI; NTIS (US Sales Only); INIS.

A factual database has a variety of forms and types of data structure that produces various kinds of records composed of a great number of data items, which differ from file to file. Second, a factual database needs higher speciality in preparation on content analysis, and users wish to process download-ed data successively for analysis, diagnosis, simulation, projecting, design, linguistic processing and so on. A meaningful quantitative datum can be divided into some consistent sub-elements. In addition to this fine structure of data elements, representation of data elements is also very important to integrate factual data on to public files. In this paper we shall discuss problems and thoughts about the structure and representation of data elements contained in numerical information on a practical basis. The guideline discussed here is under draft by sponsorship of the Government and is being implemented to build database of space experiments. The guideline involves expression, unification, notification and handling of data for numerical information in machine readable form, such as numerical value, numerical formula, graphics, semi-quantitative value, significant figures, ranged data, accuracy and precision, conversion of unit, semi-quantitative values, error information and so on. (author).

17299 (IAEA-SM–317/38) **Appropriate information systems in underdeveloped countries: The case of the Sudan.** Wesley, C. (National Council for Research, Khartoum (Sudan). National Documentation Centre); Weyers, R. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 12p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628899. Source: OSTI; NTIS (US Sales Only); INIS.

Considers the application of new technology to information systems in underdeveloped countries taking the case of the National Documentation Centre (NDC) in Khartoum, Sudan as an example. Describes the implementation of a project there to improve information collection and dissemination using microcomputers and micrographics. The scope of the project is to collect conventional and non-conventional documents produced in and about Sudan in the areas of science, technology and the social sciences, and to maintain databases containing bibliographic, research project, institutional and personnel data. Examines the advantages of microcomputers for underdeveloped countries and other technological developments such as CD-ROM, desktop publishing, expert systems and factors such as exchange of data, repackaging of information, and cooperation, all of which are likely to have an impact on scientific and technological information provision in the 1990s. Considers constraints to introducing new technology (hardware/software procurement and maintenance, operating conditions, existing document delivery systems, absence of information sharing culture) but argues that a longer term development strategy which allows for training, long term funding, cooperation and appropriate computer applications will result in sustainable information systems development in underdeveloped countries. (author). 11 refs.

17300 (IAEA-SM–317/41) **National scholarly information system in Japan. Extended synopsis.** Adachi, J. (National Center for Science Information System (NACSIS), Tokyo (Japan)). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 2p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628900. Source: OSTI; NTIS (US Sales Only); INIS.

A recent development of academic information network serving university community in Japan is reported. Quantitative aspects of academic activities in the sector of library and information services are reviewed.

17301 (IAEA-SM–317/42) **Hyperdatabase: A schema for browsing multiple databases.** Shepherd, M.A. (Dalhousie Univ., Halifax (Canada). Computer Science Div.); Watters, C.R. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 24p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628901. Source: OSTI; NTIS (US Sales Only); INIS.

In order to insure effective information retrieval, a user may need to search multiple databases on multiple systems. Although front end systems have been developed to assist the user in accessing different systems, they access one retrieval system at a time and the search has to be repeated for each required database on each retrieval system. More importantly, the user interacts with the results as independent sessions. This paper models multiple bibliographic databases distributed over one or more retrieval systems as a hyperdatabase, i.e., a single virtual database. The hyperdatabase is viewed as a hypergraph in which each node represents a bibliographic item and the links among nodes represent relations among the items. In the response to a query, bibliographic items are extracted from the hyperdatabase and linked together to form a transient hypergraph. This hypergraph is transient in the sense that it is "created" in response to a query and only "exists" for the duration of the query session. A hypertext interface permits the user to browse the transient hypergraph in a nonlinear manner. The technology to implement a system based on this model is available now, consisting of powerful workstation, distributed processing, high-speed communications, and CD-ROMs. As the technology advances and costs decrease such systems should be generally available. (author). 13 refs, 5 figs.

17302 (IAEA-SM–317/59) **Evaluation of networking and telecommunication; some experiences gained.** Podshibyakin, V. (United Nations Industrial Development Organization (UNIDO), Vienna (Austria)). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). 17303 (IAEA-SM–317/60) **Biotechnology information service of the GDR.** Poetzsch, E. (Academy of Sciences, Berlin (Germany). Scientific Information Center). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 13p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628903. Source: OSTI; NTIS (US Sales Only); INIS.

The paper gives a survey of the biotechnology information in the GDR and describes the establishment of the Biotechnology Information Service of the GDR (BioInfo GDR). BioInfo GDR is a referral database and is to provide information on information sources available in the GDR, and on institutions working in the various fields of biotechnology in the GDR. In addition, some general problems of the building and use of databases are discussed. (author). 8 refs.

17304 (IAEA-SM–317/62) **Information support for solving research and development problems.** Kornhauser, A. (Ljubljana Univ., Ljubljana (Yugoslavia). International Centre for Chemical Studies). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 2p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628904. Source: OSTI; NTIS (US Sales Only); INIS.

The approaches in developing specialized problem-oriented information systems for solving research and industrial problems are presented.

17305 (IAEA-SM–317/66) **The future of scientific, technical and industrial information to Third World users - A donors view. The experience of the International Development Research Centre (IDRC), Canada.** Broadbent, K.P. (International Development Research Centre, Ottawa (Canada). Science and Technology Information); Lafond, R. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 13p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628905. Source: OSTI; NTIS (US Sales Only); INIS.

Access to scientific information by poorer countries, sometimes referred to as the "South", is limited in contrast to the countries in the "North". The South lacks the infrastructure, management and technical expertise to develop and support the range of services now commonplace in the information rich industrial countries of the "North". The programme of support to information systems and services in poorer countries by the International Development Research Centre (IDRC) is described with specific examples drawn from its industry and technology information programme. Third world countries are in a difficult position and need help to keep on the cutting edge of new information-communication technologies. Any help, however must focus on such factors as persistence, impact and sustainability of information systems and services. (author). 5 refs.

17306 (IAEA-SM–317/70) **Needs, demands and motivation in the use of sources of information.** Lancaster, F.W. (Illinois Univ., Urbana, IL (United States). Graduate School of Library and Information Science). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 22p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628906. Source: OSTI; NTIS (US Sales Only); INIS.

For designers and managers of information services it is important to have some understanding of the factors that influence the probability that an information need will arise in the mind of some individual, that this individual will be sufficiently motivated to seek the needed information, and that he or she will select a particular information source. While our knowledge of these matters is still very far from complete, the many hundreds of "user studies" that have been performed have at least shed some light on them. Factors affecting the selection of a particular information source (e.g., information center or library) will include some user factors (e.g., previous experience with a source) and many source-related factors, including currency, cost, accessibility, reputation, dissemination and marketing efforts, and the format and content of the information available. Accessibility will be a major factor influencing use of an information source but this goes far beyond physical accessibility; intellectual and psychological accessibility must also be considered. This paper combines these various factors into a "model" of information-seeking behaviour and from this attempts to draw conclusions that may be useful in the design of future information services. 61 refs, 1 fig.

17307 (IAEA-SM–317/71) **Integration of library and information activities: The INIST challenge.** Dusoulier, N. (Institut de l'Information Scientifique et Technique (INIST-CNRS), Vandoeuvre-les-Nancy Cedex (France)). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 2p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628907. Source: OSTI; NTIS (US Sales Only); INIS.

A presentation of the INIST (Institut de l'Information Scientifique et Technique) of CNRS (France) as a complete information factory which combines all the activities involved in managing an important collection and a large-scale document delivery center with the production and operation of databases, online services, publication of current bibliographies and reference tools, production of CD-ROMs, and research activities in the field of information science and technology, is given.

17308 (IAEA-SM–317/75) **Strategic information for industrial policy-making in developing countries.** Gonod, P.F. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 23p. (In French). (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628908. Source: OSTI; NTIS (US Sales Only); INIS.

The practice shows that many crucial decisions for industrialization in developing countries have been taken based on incomplete information. For strategic decisions an incomplete information may have catastrophic consequences. The function of policy-making is defined as the process by which the information generated/or used in a particular context is reevaluated in a different context in order to formulate/or execute a policy of alternative decisions. It follows that the industrial information must be presented in such a manner to allow a reevaluation and alternative decisions. 30 notes.

Recent biochemical and carbon isotopic evidences from the Indian lithosphere (Archaean-Proterozoic sediments of the Peninsular and Lesser-Himalayan basins) suggest that early Earth's atmosphere-ocean system was buffered by mantle. The structure and palaeobiology of the early cells revealed that uni to multicellularity of cells reflects varying rates of photosynthesis and the mechanism of cell division may be as a result of mitosis or meiosis, recorded in Deoban cells of the Lesser Himalaya, India.

17312 (INIS-mf–14483) **Proceedings of the 11. conference of Czech and Slovak physicists.** Kolnik, S. (ed.). Slovenskych Matematikov a Fyzikov, Bratislava (Slovakia). Out of 146 papers presented at the conference, the proceedings contain full texts of 10 papers and 17 short communications. All these contributions have been inputted to INIS. The topics covered by the conference are subnuclear physics, nuclear physics, plasma physics, detectors, physics of metals, low-temperature physics, physics of superconductors and dielectrics, optics and quantum electronics, magnetism, thin layers, chemical physics and biophysics, acoustics and physics of molecular and macromolecular systems. (Z.S.).

17313 (ORNL/M–4156) **The Environmental Management Project Manager's Handbook for improved project definition.** Oak Ridge National Lab., TN (United States). Feb 1995. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009041. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy (DOE) is committed to providing high quality products that satisfy customer needs and are the associated with this goal, DOE personnel must possess the knowledge, skills, and abilities to ensure successful job performance. In addition, there must be recognition that the greatest obstacle to proper project performance is inadequate project definition. Without strong project definition, DOE environmental management efforts are vulnerable to fragmented solutions, duplication of effort, and wastes resources. The primary means of ensuring environmental management projects meet cost and schedule milestones is through a structured and graded approach to project definition, which is the focus of this handbook.

17314 (PNL-SA–24262) **Designing and implementing customer-focused functional support teams.** Levine, L.O.; Cejka, C.L. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950282–3: 3. international symposium on productivity and quality improvement conference, Vienna, VA (United States), 27 Feb - 1 mar 1995). Order Number DE95007814. Source: OSTI; NTIS; GPO Dep.

The contract services department of a U.S. Department of Energy research laboratory is radically revising how it serves its primary customers–the laboratory research and development staff. The department provides services that include contract research initiation (proposal preparation and contract negotiation) and acquisition of goods and services to support specific research projects. It previously provided these services with approximately 170 staff in four centralized functional units. In reorganizing, the department used a structured analysis and design process to categorize internal customers according to their unique attributes and specific support needs. Concurrently, it identified a number of conceptually distinct customer-focused units that could accomplish the contract processes in different ways and then chose a preferred concept for each customer category. The organizational concepts were designed to enhance customer service and improve staff morale and development opportunities. The new organization will have a total of 10 customer support units as well as other centralized services and activities. It will flatten the organizational structures and encourage more cooperation among contracts staff to meet customer needs for improved timeliness, communication, and teaming with researchers.

17315 (PNL-SA–25327) **A case study: Integrated work environment and organizational change.** Heubach. J.G. (Pacific Northwest Lab., Richland, WA (United States)); Montgomery, J.C.; Weimer, W.C.; Heerwagen, J.H. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950282–2: 3. international symposium on productivity and quality improvement conference, Vienna, VA (United States), 27 Feb - 1 mar 1995). Order Number DE95009119. Source: OSTI; NTIS; GPO Dep.

The failure to integrate environmental and organizational interventions may help explain the lack of success of many change efforts. The high rate of failure for change efforts (50% to 90% failure rates) has been noted by many writers. While specific causes of failure are diverse, a common theme has been failure to consider the organization as a system. That is, either significant aspects of the organization were ignored during the intervention or potential impacts of changes on the elements were overlooked or underestimated. Our own training, technical literature, and professional culture lead us to limited understandings of complex organizations. Change agents must consider all relevant components of organizational performance if interventions are to be meaningful and successful. This study demonstrated the value of an integrated organizational intervention involving redesign of the physical environment, introduction of a new information system, work process improvement, and extended organizational development intervention. The outcomes were extremely positive. The cost of improvement efforts was found to be recaptured within a short time, easily justifying the expenditures. One conclusion from the study is that integrated interventions are very powerful. Integrating improvement of the physical environment with organizational development and technological innovation greatly enhances the likelihood of achieving a successful intervention.

17316 (RERF-AR–91-92) **Annual report of Radiation Effects Research Foundation, April 1, 1991 - March 31, 1992.** Radiation Effects Research Foundation, Hiroshima (Japan). 1993. 165p. (In Japanese). Order Number DE95768250. Source: OSTI; NTIS; INIS.

This is an annual report concerning research activities and achievement in the Radiation Effects Research Foundation (RERF) in Japan during the period April 1, 1991-March 31, 1992. During this period, 25 publications were approved, including some epoch studies (such as the life span study that revealed a significant increase of cardiovascular disease of A-bomb survivors and the study on thyroid cancer). The present report deals with scientific achievement of each division of RERF; various activities including international cooperation programs, workshop, lectures, and in-house seminars; abstracts of new research topics, achievement reports, and review reports; a list of publications and presentations by staff members in academic meetings; and RERF organization affairs including activities, financial aspects, a list of visitors to RERF. An Appendix gives the proceedings; a brief summary of the workshop on 'the application of molecular genetics to the study of mutation in the children of A-bomb survivors' held in November 12-14, 1991; both ongoing and completed research topics as of March 31, 1992; and a list of RERF personnel. (N.K.).

17317 (RERF-AR–92-93) **Annual report of Radiation Effects Research Foundation, April 1, 1992 - March 31, 1993.** Radiation Effects Research Foundation, Hiroshima (Japan). 1994. 183p. (In Japanese). Order Number DE95768251. Source: OSTI; NTIS; INIS.

This is an annual report concerning research activities and achievement in the Radiation Effects Research Foundation (RERF) in Japan during the period April 1, 1992-March 31, 1993. Twenty-nine reports, including integrated report on the incidence of solid tumors (surveyed during the period 1958-1987) and the report on the incidence of leukemia (surveyed during the period 1950-1987), were approved in the fiscal year 1992. The present report deals with scientific achievement of each division of RERF; various activities including international cooperation programs, disease monitoring workshop, lectures, and in-house seminars; abstracts of new research topics, achievement reports, and review reports; a list of publications and presentations by staff members in academic meetings; and RERF organization affairs including activities, financial aspects, and a list of visitors to RERF. An Appendix gives the proceedings; a brief summary of disease monitoring workshop; ongoing and completed research topics; and a list of RERF personnel. (N.K.).

17318 (RISO-R–793(EN)) **Optics and fluid dynamics department annual progress report for 1994.** Hanson, S.G.; Lading, L.; Lynov, J.P.; Michelsen, P. Risoe National Lab., Roskilde (Denmark). Optics and Fluid Dynamics Dept. Jan 1995. 68p. Order Number DE95627114. Source: OSTI; NTIS; INIS.

Research in the Optics and Fluid Dynamics Department is performed within the following two programme areas: optics and continuum physics. In optics the activities are within (a) optical materials and electromagnetic propagation, (b) diagnostics and sensors, and (c) information processing. In continuum physics the activities are (a) nonlinear dynamics and (b) computer physics. The activities are supported by several EU programmes, including EURATOM, by research councils, and by industry. A special activity is the implementation of pellet injectors for fusion research. A summary of activities in 1994 is presented. (au) (27 ills., 44 refs.).

17319 (RISO-R–807(EN)) **Nuclear Safety Research Department annual progress report 1994.** Majborn, B.; Brodersen, K.; Damkjaer, A.; Hoejerup, C.F. (eds.). Risoe National Lab., Roskilde (Denmark). Nuclear Safety Research Dept. Mar 1995. 36p. Order Number DE95628910. Source: OSTI; NTIS; INIS.

The report describes the work of the Nuclear Safety Research Department during 1994. The activities cover health physics, reactor physics, operation of the small reactor DR1, and radioactive waste management. Lists of staff and publications are included together with a summary of the staff's participation in international committees. (au) (1 tab., 12 ills.).

17320 (UTRCN-G–23) **Report on progress of researches by common utilization of JAERI nuclear facilities, for fiscal 1993.** Tokyo Univ. (Japan). Research Center for Nuclear Science and Technology. Jul 1994. 378p. (In Japanese, English). Order Number DE95768241. Source: OSTI; NTIS; INIS.

The results of the joint researches by utilizing the facilities of JAERI in 1993 fiscal year were summarized. The number of research themes in 1993 was 228 cases. In this book, 243 reports are collected. (J.P.N.).

17321 (WHC-SD-GN-UM–30008-Rev.1) **Westinghouse Hanford Company Data Management Plan Template. Revision 1.** Friday, K.K. Westinghouse Hanford Co., Richland, WA (United States). 1 Mar 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010046. Source: OSTI; NTIS; INIS; GPO Dep.

The Data Management Plan Template provides guidelines for the content and writing of data management plans. These plans discuss how data management is being implemented within the scope of any given project, program, or business function. (The entire document was revised and changed to reflect a simplified outline and clarification of required information.)

17322 (BNL–52458) **Introduction to computers: Reference guide.** Ligon, F.V. Brookhaven National Lab., Upton, NY (United States). [1995]. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95009412. Source: OSTI; NTIS; GPO Dep.

The "Introduction to Computers" program establishes formal partnerships with local school districts and community-based organizations, introduces computer literacy to precollege students and their parents, and encourages students to pursue Scientific, Mathematical, Engineering, and Technical careers (SET). Hands-on assignments are given in each class, reinforcing the lesson taught. In addition, the program is designed to broaden the knowledge base of teachers in scientific/technical concepts, and Brookhaven National Laboratory continues to act as a liaison, offering educational outreach to diverse community organizations and groups. This manual contains the teacher's lesson plans and the student documentation to this introduction to computer course.

17323 (CERN–94-06) **1993 CERN school of computing. Proceedings.** Vandoni, C.E. (ed.); Verkerk, C. (ed.). European Organization for Nuclear Research, Geneva (Switzerland). 14 Oct 1994. 304p. (CONF-9309478–: 16. CERN School of Computing, L'Aquila (Italy), 12-25 Sep 1993). Order Number DE95627098. Source: OSTI; NTIS (US Sales Only); INIS.

These proceedings contain the majority of the lectures given at the 1993 CERN School of Computing. Artificial neural networks were treated with particular emphasis on applications in particle physics. A discussion of triggering for experiments at the proposed LHC machine provided a direct connection to data acquisition in this field, whereas another aspect of signal processing was seen in the description of a gravitational wave interferometer. Some of the more general aspects of data handling covered included parallel processing, te IEEE mass storage system, and the use of object stores of events. Lectures on broadband telecommunications networks and asynchronous transfer mode described some recent developments in communications. The analysis and visualization of the data were discussed in the talks on general-purpose portable software tools (PAW++, KUIP and PIAF) and on the uses of computer animation and virtual reality to this end. Lectures on open software discussed operating systems and distributed computing, and the evolution of products like Unix, NT and DCE. (orig.) e.

17324 (CONF-9406279–Absts.) **Fifth international conference on hyperbolic problems – theory, numerics, applications: Abstracts.** State Univ. of New York, Stony Brook, NY (United

States). Dept. of Applied Mathematics and Statistics. [1994]. 111p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract FG02-94ER25195. From 5. international conference on hyperbolic problems; Stony Brook, NY (United States); Jun 1994. Order Number DE95008173. Source: OSTI; NTIS; INIS; GPO Dep.

The conference demonstrated that hyperbolic problems and conservation laws play an important role in many areas including industrial applications and the studying of elasto-plastic materials. Among the various topics covered in the conference, the authors mention: the big bang theory, general relativity, critical phenomena, deformation and fracture of solids, shock wave interactions, numerical simulation in three dimensions, the level set method, multidimensional Riemann problem, application of the front tracking in petroleum reservoir simulations, global solution of the Navier-Stokes equations in high dimensions, recent progress in granular flow, and the study of elastic plastic materials. The authors believe that the new ideas, tools, methods, problems, theoretical results, numerical solutions and computational algorithms presented or discussed at the conference will benefit the participants in their current and future research.

17325 (CONF-950181–1) **Use of the NII to study impacts of new technologies and policies on supply and demand of electric power.** Munro, J.K. Jr. (Oak Ridge National Lab., TN (United States). Instrumentation and Controls Div.). Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Information and telecommunications technology for the U.S. utilities industry; Atlanta, GA (United States); 30-31 Jan 1995. Order Number DE95009075. Source: OSTI; NTIS; GPO Dep.

This paper describes a proposal to use an implementation of client-server technology on the Internet for simulating a number of aspects of electric power production, distribution, and consumption within a wholly new regulatory, financing, operating, and control environment. This approach would use a large number of people to generate strategies and decisions, in a real-time context, needed to drive the simulation. A World Wide Web server would provide background information about the simulation for those who chose to participate as actors in one of supported roles. Roles would be based on activities associated with different business areas and would include utility manager, independent power producer (entrepreneur), electric power futures trader, electric power futures investor, electric power wheeler, industrial customer, commercial customer, and residential customer. The simulation program would run on a system of high-performance computers (parallel computer system) that communicate between each other on a high speed communications bus. These computers would also be the server systems for the client programs used by the actors. People who want to be actors would be required to register before being given a client program, as a way to have some control over the simulation results. Each role will have its corresponding client program with graphical user interface. Each client program will support a common view of the simulation results and a role specific view.

17326 (CONF-950226–33) **An evaluation of an automatic markup system.** Taghva, K.; Condit, A.; Borsack, J. Nevada Univ., Las Vegas, NV (United States). Information Science Research Inst. [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. From SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine; San Jose, CA (United States); 5-10 Feb 1995. Order Number DE95009885. Source: OSTI; NTIS; GPO Dep.

One predominant application of OCR is the recognition of full text documents for information retrieval. Modern retrieval systems exploit both the textual content of the document as well as its structure. The relationship between textual content and character accuracy have been the focus of recent studies. It has been shown that due to the redundancies in text, average precision and recall is not heavily affected by OCR character errors. What is not fully known is to what extent OCR devices can provide reliable information that can be used to capture the structure of the document. In this paper, the authors present a preliminary report on the design and evaluation of a system to automatically markup technical documents, based on information provided by an OCR device. The device the authors use differs from traditional OCR devices in that it not only performs optical character recognition, but also provides detailed information about page layout, word geometry, and font usage. Their automatic markup program, which they call Autotag, uses this information, combined with dictionary, lookup and content analysis, to identify structural components of the text. These include the document title, author information, abstract, sections, section titles, paragraphs, sentences, and de-hyphenated words. A visual examination of the hardcopy will be compared to the output of their markup system to determine its correctness.

17327 (CONF-950226–34) **Prediction of OCR accuracy using simple image features.** Blando, L.R.; Kanai, Junichi; Nartker, T.A. Nevada Univ., Las Vegas, NV (United States). Information Science Research Inst. [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. From SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine; San Jose, CA (United States); 5-10 Feb 1995. Order Number DE95009887. Source: OSTI; NTIS; GPO Dep.

A classifier for predicting the character accuracy of a given page achieved by any Optical Character Recognition (OCR) system is presented. This classifier is based on measuring the amount of white speckle, the amount of character fragments, and overall size information in the page. No output from the OCR system is used. The given page is classified as either good quality (i.e., high OCR accuracy expected) or poor (i.e., low OCR accuracy expected). Six OCR systems processed two different sets of test data: a set of 439 pages obtained from technical and scientific documents and a set of 200 pages obtained from magazines. For every system, approximately 85% of the pages in each data set were correctly predicted. The performance of this classifier is also compared with the ideal-case performance of a prediction method based upon the number of reject markers in OCR generated text. In several cases, this method matched or exceeded the performance of the reject based approach.

17328 (CONF-950226–35) **A preliminary evaluation of histogram-based binarization algorithms.** Kanai, Junichi; Grover, K. Nevada Univ., Las Vegas, NV (United States). Heat Transfer Lab. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. From SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine; San Jose, CA (United States); 5-10 Feb 1995. Order Number DE95009886. Source: OSTI; NTIS; GPO Dep.

To date, most Optical Character Recognition (OCR) systems process binary document images, and the quality of the input image strongly affects their performance. Since a binarization process is inherently lossy, different algorithms typically produce different binary images from the same gray scale image. The objective of this research is to study effects of global binarization algorithms on the performance of OCR systems. Several binarization methods were examined: the best fixed threshold value for the data set, the ideal histogram method, and Otsu's algorithm. Four contemporary OCR systems and 50 hard copy pages containing 91,649 characters were used in the experiments. These pages were digitized at 300 dpi and 8 bits/pixel, and 36 different threshold values (ranging from 59 to 199 in increments of) 4 were used. The resulting 1,800 binary images were processed by all four OCR systems. All systems made approximately 40% more errors from images generated by Otsu's method than those of the ideal histogram method. Two of the systems made approximately the same number of errors from images generated by the best fixed threshold value and Otsu's method.

17329 (CONF-9505145–2) **Finite-sample based learning algorithms for feedforward networks.** Rao, N.S.V. (Oak Ridge National Lab., TN (United States)); Protopopescu, V.; Mann, R.C.; Oblow, E.M.; Iyengar, S.S. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Symposium on theory of computing; Las Vegas, NV (United States); 29

May - 1 jun 1995. Order Number DE95009123. Source: OSTI; NTIS; GPO Dep.

We discuss two classes of convergent algorithms for learning continuous functions (and also regression functions) that are represented by FeedForward Networks (FFN). The first class of algorithms, applicable to networks with unknown weights located only in the output layer, is obtained by utilizing the potential function methods of Aizerman et al. The second class, applicable to general feedforward networks, is obtained by utilizing the classical Robbins-Monro style stochastic approximation methods. Conditions relating the sample sizes to the error bounds are derived for both classes of algorithms using martingale-type inequalities. For concreteness, the discussion is presented in terms of neural networks, but the results are applicable to general feedforward networks, in particular to wavelet networks. The algorithms can also be directly applied to concept learning problems. A main distinguishing feature of the this work is that the sample sizes are based on explicit algorithms rather than information-based methods.

17330 (ENEA-RT-AMB–95-02) **About Unix.** Caiaffa, E. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Jan 1995. 25p. (In Italian). (RT/AMB–95-02). Order Number DE95771030. Source: OSTI; NTIS (US Sales Only).

The aim of the present study is to investigate the main technical and historical reasons that led to Unix system birth, evolution and diffusion. Nowadays Unix is a phenomenon involving various aspects such as technology, market trends and industrial politics. Unix operating system has widely contributed to the bases and growth of open system. This paper reviews ideas behind the concept of open system and its evolution together with instruments which allowed its practical development. Also care has been taken to clarify the meaning and scopes associations, organizations and committees such as X/Open, OSF (Open Software Foundation), SCO (Santa Cruz Operation), ACE (Advanced Computing Environment) and others.

17331 (ES/ER/TM–146) **Geostatistical applications in environmental remediation.** Stewart, R.N. (Univ. of Tennessee, Knoxville, TN (United States)); Purucker, S.T.; Lyon, B.F. Oak Ridge National Lab., TN (United States). Feb 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009998. Source: OSTI; NTIS; GPO Dep.

Geostatistical analysis refers to a collection of statistical methods for addressing data that vary in space. By incorporating spatial information into the analysis, geostatistics has advantages over traditional statistical analysis for problems with a spatial context. Geostatistics has a history of success in earth science applications, and its popularity is increasing in other areas, including environmental remediation. Due to recent advances in computer technology, geostatistical algorithms can be executed at a speed comparable to many standard statistical software packages. When used responsibly, geostatistics is a systematic and defensible tool can be used in various decision frameworks, such as the Data Quality Objectives (DQO) process. At every point in the site, geostatistics can estimate both the concentration level and the probability or risk of exceeding a given value. Using these probability maps can assist in identifying clean-up zones. Given any decision threshold and an acceptable level of risk, the probability maps identify those areas that are estimated to be above or below the acceptable risk. Those areas that are above the threshold are of the most concern with regard to remediation. In addition to estimating clean-up zones, geostatistics can assist in designing cost-effective secondary sampling schemes. Those areas of the probability map with high levels of estimated uncertainty are areas where more secondary sampling should occur. In addition, geostatistics has the ability to incorporate soft data directly into the analysis. These data include historical records, a highly correlated secondary contaminant, or expert judgment. The role of geostatistics in environmental remediation is a tool that in conjunction with other methods can provide a common forum for building consensus.

17332 (ESTSC–000158D0VAX03) **DOE2.1E. Building Energy Consumption Analysis.** Birdsall, B. (Lawrence Berkeley National Lab., CA (United States)); Buhl, W.; Ellington, K.; Erdem, E.; Meldem, R; Winkelmann, F.; Hirsch, J.J.; Gates, S. Lawrence Berkeley Lab., CA (United States). 1 Oct 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Source: ESTSC.

Description: DEC VAX; VMS; FORTRAN; 1 Mag Tape (VAX/VMS Backup Format). File naming conventions: .SRC UPDATE source file, .UPL UPDATE program library, .MOD UPDATE modification file, .FOR FORTRAN source code, .OBJ object file (output of compiler), .EXE executable file (output of linker), .TMP temporary file, .BIN binary file, .DAT ASCII data file, .INP input file, .INC include file for macro input, and .OUT output file.

DOE2.1E is a set of programs for the analysis of energy consumption in residental and commercial buildings. Programs are included to enter input data (Building Description Language Processor), to calculate the heating and cooling loads for each space in a building for each hour of a year (LOADS subprogram), to simulate the operation and response of the equipment and systems that control temperature and humidity and distribute heating and cooling to the building (SYSTEMS subprogram), to model primary energy conversion equipment that uses fuel or electricity to provide the required heating, cooling, and electricity (PLANT subprogram), to compute the cost of energy and building operation based on utility rate schedules and economic parameters (ECONOMICS subprogram), to display results (Reports subprogram), and to convert raw weather files into DOE-2 compatible weather files (Weather Processor). A library of materials, constructions, and windows is provided.

17333 (ESTSC–000158SUN0001) **DOE2.1E. Building Energy Consumption Analysis.** Birdsall, B. (Lawrence Berkeley National Lab., CA (United States)); Buhl, W.; Ellington, K.; Erdem, E.; Meldem, R.; Winkelmann, F.; Hirsch, J.; Gates, S. Lawrence Berkeley Lab., CA (United States). 1 Oct 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Source: ESTSC.

Description: SUN; UNIX; FORTRAN; 1 QIC 150/250 Cartridge. File naming conventions: .SRC UPDATE source file, .UPL UPDATE program library, .MOD UPDATE modification file, .FOR FORTRAN source code, .OBJ object file (output of compiler), .EXE executable file (output of linker), .TMP temporary file, .BIN binary file, .DAT ASCII data file,. INP input file, .INC include file for macro input, .OUT output file.

DOE2.1E is a set of programs for the analysis of energy consumption and cost in residential and commercial buildings. Programs are included to enter input data (Building Description Language Processor), to calculate the heating and cooling loads for each space in a building for each hour of a year (LOADS subprogram), to simulate the operation and response of the equipment and systems that control temperature and humidity and distribute heating and cooling to the building (SYSTEMS subprogram), to model primary energy conversion equipment that uses fuel or electricity to provide the required heating, cooling, and electricity (PLANT subprogram), and to compute the cost of energy and building operation based on utility rate schedules and economic parameters (ECONOMICS subprogram), to display results (Reports subprogram)), and to convert raw weather files into DOE-2 compatible weather files (Weather Processor). A library of materials, constructions, and windows is provided.

17334 (ESTSC–000175IBMPC02) **INTERLINE5.0. Railroad Routing Model.** Johnson, Paul E. (Oak Ridge National Lab., TN, (United States)); Joy, David S. Oak Ridge National Lab., TN (United States). 1 Mar 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: IBM PC; DOS 3.1 or greater.; FORTRAN 77; 1 3.5 Diskette. INTERLINE expects data files to conform to its standard names. Program uses calls to MICROSOFT FORTRAN extensions.

INTERLINE/PC is an interactive program designed to simulate the routing practices of the United States rail system. The rail industry is divided into a large number of independent competing companies. The INTERLINE data base represents these rail companies as 94 separate subnetworks. An additional two subnetworks represent navigable inland/intracoastal and deep draft marine

routes. Interchange points between individual rail systems and waterway systems are also identified.

17335 (ESTSC–000702D0VAX00) **NUMBERDENSITY. Provides Core/Region Atomic Densities for Physics Codes.** Shirley, G. (CEGA Corporation, San Diego, CA (United States)). General Atomics, San Diego, CA (United States). 13 Mar 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90CH10438. Source: ESTSC.

Description: DEC VAX; VMS; FORTRAN; 1 Mag Tape. Many input quantities are currently hardwired for the NP-MHTGR design. Package compiled and linked without error.

NUMBERDENSITY provides core/region atomic densities, Dancoff factors, particle packing fractions for various physics codes, including MICROX, GARGOYLE, and GAUGE.

17336 (ESTSC–000723IB38600) **FLUFIXMOD2. Two-fluid Hydrodynamic Model for Fluid-Flow Simulation in Fluid-Solids Systems.** Lyczkowski, R.W. (Argonne National Lab., IL (United States)); Bouillard, J.X.; Folga, S.M. Aerolab Development Co., Pasadena, CA (United States). 1 Apr 1992. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: IBM PC 386; Designed to be portable; FORTRAN 77; 1 3.5 Diskette.

FLUFIX is a two-dimensional , transient, Eulerian, and finite-difference program, based on a two-fluid hydrodynamic model, for fluid flow simulation in fluid-solids systems. The software is written in a modular form using the Implicit Multi-Field (IMF) numerical technique. Quantities computed are the spatial distribution of solids loading, gas and solids velocities, pressure, and temperatures. Predicted are bubble formation, bed frequencies, and solids recirculation. Applications include bubbling and circulating atmospheric and pressurized fluidized bed reactors, combustors, gasifiers, and FCC (Fluid Catalytic Cracker) reactors.

17337 (ESTSC–000749IBMPC00) **KINETICSV3.2. A Computer Program to Analyze Chemical Reaction Rate Data.** Braun, R.L. (Lawrence Livermore National Laboratory, Livermore, CA (United States)); Burnham, A.K. Lawrence Livermore National Lab., CA (United States). 1 Sep 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC.

Description: IBM PC; MS-DOS; Fortran; 4 3.5 Diskettes.

KINETICS (Version 3.2) is a copyrighted, user-friendly kinetics analysis computer program designed for reactions such as kerogen or polymer pyrolysis. It uses least-squares refinement to fit rate parameters to chemical reaction data (rate or cumulative reacted) measured at a series of constant temperatures, constant heating rates, or arbitrary thermal histories.

17338 (ESTSC–000749SPARC00) **KINETICSV3.2. A Computer Program to Analyze Chemical Reaction Rate Data.** Braun, R.L. (Lawrence Livermore National Laboratory, Livermore, CA (United States)); Burnham, A.K. Lawrence Livermore National Lab., CA (United States). 1 Sep 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC.

Description: SUN SPARC; UNIX; Fortran; 5 3.5 Diskettes.

KINETICS (Version 3.2) is a copyrighted, user-friendly kinetics analysis computer program designed for reactions such as kerogen or polymer pyrolysis. It uses least-squares refinement to fit rate parameters to chemical reaction data (rate or cumulative reacted) measured at a series of constant temperatures, constant heating rates, or arbitrary thermal histories.

17339 (ESTSC–000766AL00000) **TEAM. Technology Evaluation and Analysis Methodology Systems Analysis.** Bingham, T.A. (Lockheed Idaho Technologies Company, Idaho Falls, ID (United States)); Caldwell, M.A.; Nichols, T.T.; Pincock, L.F.; Reiser, S.I. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1 Oct 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Source: ESTSC.

Description: APPLE MACINTOSH; Apple System 7 or higher; Prograph CPX; 1 3.5 Diskette.

TEAM provides a computer simulation/systems model for evaluation of process technology options to process nuclear waste at the Idaho Chemical Processing Plant. The model uses a life-cycle approach to evaluate costs for user specified options, as well as time phasing effects to cost, waste volumes, time to completion of processing, and other variables.

17340 (ESTSC/NRC–000004IBMPC02) **RASCAL2.1. Radiological Dose Assessment System.** Sjoreen, A.L. (Oak Ridge National Lab., TN (United States)); Athey, G.F.; Ramsdell, J.V.; McKenna, T.J. Oak Ridge National Lab., TN (United States). 1 Dec 1994. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data. Source: ESTSC; Source Code Not Included.

Description: IBM PC; MS-DOS 3.1 or later, 6.0 recommeMicrosoft Fortran 5.0 (60%) and Microsoft C 7.0 (40%); 1 3.5 Diskette. SOURCE CODE NOT INCLUDED.

RASCAL was developed to estimate doses during response to radiological emergencies. Revisions to RASCAL 2.0 have required the release of version 2.1. Three new source term calculations have been added: (1) a source term based on the reactor containment monitor reading, (2) a source term for a spent fuel pool accident, and (3) an isotopic concentration source term. The tabular output has been modified to include Environmental Protection Agency (EPA) Protective Action Guidance (PAGS). FM-DOSE calculations have been extended to include consideration of the effect of delay for re-entry on first-year and second-year dose, to incorporate a variable resupension rate, and to compute a factor used to estimate first-year dose from R/hr measurements on the ground. Also, RASCAL 2.1 supports the saving of cases and the use of a mouse for user input.

17341 (ESTSC/NRC–000005IBMPC01) **IMPACTS-BRC 2.1. Analyses of Potential Radiological Impacts.** Rao, R.R. (Sandia National Labs., Albuquerque, NM (United States)); Kozak, M.W.; Harlan, C.P.; Austin, V.; Rollstin, J.A. Sandia National Labs., Albuquerque, NM (United States). 1 Jul 1990. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Material Safety and Safeguards. Source: ESTSC.

Description: IBM PC; DOS 2.1 or higher, however will FORTRAN 77; 1 3.5 Diskette. Because IMPACTS-BRC 2.1 is a compliance code, the source code is not included with the package.

IMPACTS-BRC2.1 is a generic radiological assessment code that allows calculation of potential impacts to maximum individuals, waste disposal workers, and the general population resulting from exemption of very low-level radioactive wastes from regulatory control. The code allows calculations to be made of human exposure to the waste by many pathways and exposure scenarios.

17342 (ESTSC/NRC–000007D113400) **PSDREC. Continuous On-line Reactor Monitor.** Smith, C.M. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). 13 Jan 1992. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. DOE Contract AC05-84OR21400. (NESC–1107). Source: ESTSC.

Description: DEC PDP11/34; RT-11 V4.0; FORTRAN IV (85%) and MACRO (15%); 1 Mag Tape.

PSDREC is a statistically-based pattern recognition system developed for continuous, on-line, unattended surveillance of dynamic reactor signals. The system provides a detailed record of the power spectral density values (PSDs) of the signals and their statistical characteristics. PSD measurements on process signals are the performance signatures that characterize the health of the monitored equipment. PSDREC can monitor 16 signals, use 15 signals in determining the operational state of the reactor, and store traceable historical data on suspect conditions. The PSDREC surveillance system uses four types of power spectral densities. These are formed over time spans. PSDZ is the short-term trend spectrum used to detect rapidly occurring signals. Each of the other three spectra is formed by ensemble averaging different numbers of PSDZ spectra. PSDB, the baseline spectrum, is formed over the longest time span. It is formed only once for each operational state. PSDT and PSDC are the long-term reference and candidate trend spectra which are formed over a relatively long time span and are used to reflect slow changes in the signal.

17343 (ETDE-IT–95-14) **Geometrical approach to direct solution of linear algebraic systems on Quadrics parallel computers.** Ricci, A. (ENEA, Bologna (Italy). Progetto Interdipartimentale Calcolo e Reti ad alte Prestazioni (HPCN)). ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione. Sep 1994. 10p. Order Number DE95771053. Source: OSTI; NTIS (US Sales Only).

Direct methods for the solution of linear algebraic systems are described which require neither pivoting nor any integer variable, thus lending themselves to a convenient use on Quadrics parallel computers. As to computing speed they fairly compare with the commonly used direct methods.

17344 (FEI–2344) **Modern programming system for numerical simulation of thermohydraulics and thermomechanics processes.** Korolev, V.N.; Sorokin, A.P.; Ukhov, V.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1993. 14p. (In Russian). Order Number DE95628885. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the first step of the elaboration of a modern computer code for structural analysis and hydrodynamic processes of primary coolant circuit are presented in this work. The conceptual scheme of a program and specifications for the key components have been proposed. 79 refs., 1 fig.

17345 (IFVE-OEA–93-136) **EUR6500 auxiliary controllers for data readout, filtering and buffering.** Matveev, M.Yu. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 13p. (In Russian). Order Number DE95628812. Source: OSTI; NTIS (US Sales Only); INIS.

Four types of CAMAC/SUMMA EUR6500 auxiliary controllers and T-312 CAMAC testing module are described. 10 refs., 5 figs.

17346 (IFVE-OEIUNK/OEA–93-118) **Fastbus multifunctional interface module.** Kipiani, K.K. (AN Gruzinskoj SSR, Tbilisi (Georgia). Inst. Fiziki); Koshtoev, V.V.; Matveev, M.Yu. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 11p. (In Russian). Order Number DE95628814. Source: OSTI; NTIS (US Sales Only); INIS.

Fastbus multifunctional interface module for Fastbus Crate Segment, MISS readout and trigger electronic system and two SCSI busses interconnection is described. 8 refs., 3 figs., 1 tab.

17347 (IHEP–93-130) **Improved numerical algorithm for Newton's minimization of χ^2 functionals.** Alekhin, S.I. Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation). 1993. 11p. Order Number DE95628886. Source: OSTI; NTIS (US Sales Only); INIS.

Numerical stability of Newton's algorithm applied to minimization of χ^2 functionals is considered. It is shown that the increase of experimental data precision leads to growth of numerical instability of this algorithm as well as of its modifications. As one of possible ways to suppress these instabilities 'semi-analytical' algorithm of χ^2 derivatives calculation is investigated. It is shown that application of the algorithm can save at least one order of magnitude of the required calculation precision of theoretical expectation in Z-boson line shape fitting. 3 refs., 3 figs., 1 tab.

17348 (INEL–94/0074) **Constrained noninformative priors.** Atwood, C.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Oct 1994. 16p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-94ID13223. Source: OSTI; NTIS; INIS.

The Jeffreys noninformative prior distribution for a single unknown parameter is the distribution corresponding to a uniform distribution in the transformed model where the unknown parameter is approximately a location parameter. To obtain a prior distribution with a specified mean but with diffusion reflecting great uncertainty, a natural generalization of the noninformative prior is the distribution corresponding to the constrained maximum entropy distribution in the transformed model. Examples are given.

17349 (INEL–94/0121) **Data management system: User's guide.** Idaho National Engineering Lab., Idaho Falls, ID (United States). 15 Nov 1994. 29p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95008692. Source: OSTI; NTIS; GPO Dep.

Data Management System (DMS) is a menu-driven, user-friendly system that allows you to manipulate software and data files as follows: Download files and software from the network to your personal computer; Compress files into a single archive file; Decompress files from an archive file; Remove files from your PC; Copy files from the source directory to the destination directory; and Configure DMS for your specific PC and network configuration. This user's guide provides instructions for operating the system and setup configuration.

17350 (INIS-mf–14519) **Quantitative schemes in energy dispersive X-ray fluorescence implemented in AXIL.** Tchantchane, A. (Centre de Developpement des Techniques Nucleaires, Algiers (Algeria)); Benamar, M.A.; Tobbeche, S. No corporate text available. Jan 1995. 9p. Order Number DE95628148. Source: OSTI; NTIS (US Sales Only); INIS.

E.D.X.R.F (Energy Dispersive X-ray Fluorescence) has long been used for quantitative analysis of many types of samples including environment samples. the software package AXIL (Analysis of x-ray spectra by iterative least quares) is extensively used for the spectra analysis and the quantification of x-ray spectra. It includes several methods of quantitative schemes for evaluating element concentrations. We present the general theory behind each scheme implemented into the software package. The spectra of the performance of each of these quantitative schemes. We have also investigated their performance relative to the uncertainties in the experimental parameters and sample description.

The computing community has long faced the problem of scientifically comparing different computers and different algorithms. When speeds or architectures or methods are very different, it is difficult or misleading to compare by taking the ratio of execution times, keeping all other things fixed. This paper presents a practical and fair approach that provides mathematically sound comparison of computational performance even when the algorithm, the computer, and the precision are changed. The HINT method removes the need for pseudo-work measures such as "Mflop/s" or "MIPS." It is designed to be particularly revealing of memory bandwidth and memory hierarchies. The scalability of HINT allows it to compare computing as slow as hand calculation to computing as fast as the largest supercomputer systems. It ports to every sequential and parallel programming environment with very little effort, permitting fair but low-cost comparison of any architecture capable of digital arithmetic.

17354 (JAERI-Data/Code–94-021) **Vectorization and improvement of nuclear codes. 3. DGR, STREAM V3.1, Cella, GGR.** Nemoto, Toshiyuki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Eguchi, Norikuni; Watanabe, Hideo; Machida, Masahiko; Yokokawa, Mitsuo; Fujii, Minoru. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1995. 125p. (In Japanese). Order Number DE95767954. Source: OSTI; NTIS; INIS.

In FORTRAN 77EX for FACOM VP2600 supercomputer.

Four nuclear codes have been vectorized and improved in order to realize the high speed performance on the VP2600 supercomputer at Computing and Information Systems Center of JAERI in the fiscal year 1993. Molecular Dynamics simulation code DGR which simulates the irradiation damage on diamond crystalline, three-dimensional non-steady compressible fluid dynamics code STREAM V3.1, two-dimensional fluid simulation code using Cell Automaton model Cella and Molecular Dynamics code GGR which simulates the irradiation damage on black carbon crystalline have been vectorized and improved, respectively. Speed up ratios by the vectorization to scalar mode on VP2600 show 2.8, 6.8-14.8, 15-16 and 1.23 times for DGR, STREAM V3.1, Cella and GGR, respectively. In this report, we present vectorization techniques, vectorization effects, evaluations of the numerical results and techniques for the improvement. (author).

17355 (JINR-E–2-94-417) **Electronic Guide for Nuclear Cross-Sections (Version 1994).** Barashenkov, V.S.; Polanski, A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1994. 4p. Order Number DE95628146. Source: OSTI; NTIS (US Sales Only); INIS.

A short description of a fortran CROSEC code providing the integral cross-sections for pion-nucleus, nucleus-nucleus interactions (total, inelastic, elastic) is given. The hadron-nucleus cross-sections are obtained by means of interpolation between estimated experimental data at target charge numbers Z>3 and energies from 14 MeV up to 1 TeV. The nucleus-nucleus cross sections are calculated with the help of approximation formula with fitted coefficient at energies above several MeV/nucleons. The CROSEC code uses 168 KB RAM and can be used in interactive way to generate separate values or tables of cross sections on a display screen or file. Fractions of the CROSEC code can be used as subroutines employed by other codes. 8 refs.

Submitted to Nuclear Instruments and Methods in Physics Research. Section A, Accelerators, Spectrometers, Detectors and Associated Equipment.

Computed results of the 3D magnetic field of a spectrometer intended for investigation of hadron production of charmed particles and the indication of the narrow resonances in neutron-nucleus interaction are presented. The methods, used in computations - finite element method and finite element method with suggested new infinite elements are described. For accuracy control the computations were carried out on a sequence of three-dimensional meshes. Special attention is devoted to the behaviour of the magnetic field in the basic detectors (proportional chambers) region. The performed results can be used for the field behaviour estimate of similar spectrometer magnets. 12 refs., 16 figs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 12p. (In Russian). Order Nu.nber DE95627096. Source: OSTI; NTIS (US Sales Only); INIS.

A program for unfolding the true distribution from experimental data distorted by a detector is described. For the given detector a result is obtained by the least squares method, hence, without bias and involving minimal statistical errors. Stability of the result is achieved at the expense of its information content and/or using additional information on the shape of the distribution to be measured. (author). 4 refs.

Submitted to Zhurnal Vychislitel'noj Matematiki i Matematicheskoj Fiziki.

An iterative method for numerical investigation of the spherically-nonsymmetric polaron in the limit of strong coupling is proposed. An expansion in spherical harmonics is used for an approximation of the solution. An originality of the method consists in creating an iterative Newtonian scheme with an additional parametrization of the initial equation, owing to that a transition from a simple linear problem to the initial nonlinear one is fulfilled. A classification for solutions of the problem is constructed in accordance with a numeration of the spherical harmonics. The testing calculations for various parameters of the problem and a comparison of obtained results with famous ones confirm the efficiency of the elaborated algorithms. 13 refs., 1 fig., 3 tabs.

17373 (LA-UR–94-3256) **A two-timescale approach to nonlinear Model Predictive Control.** Buescher, K.L.; Baum, C.C. Los Alamos National Lab., NM (United States). [1994]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950653–1: 1995 American control conference, Seattle, WA (United States), Jun 1995). Order Number DE95000943. Source: OSTI; NTIS; GPO Dep.

Model Predictive Control (MPC) schemes generate controls by using a model to predict the plant's response to various control strategies. A problem arises when the underlying model is obtained by fitting a general nonlinear function, such as a neural network, to data: an exorbitant amount of data may be required to obtain accurate enough predictions. We describe a means of avoiding this problem that involves a simplified plant model which bases its predictions on averages of past control inputs. This model operates on a timescale slower than- the rate at which the controls are updated and the plant outputs are sampled. Not only does this technique give better closed-loop performance from the same amount of open-loop data, but it requires far less on-line computation as well. We illustrate the usefulness of this two-timescale approach by applying it to a simulated exothermic continuously stirred tank reactor with jacket dynamics.

17374 (LA-UR–94-4088) **Bicriteria network design problems.** Marathe, M.V.; Ravi, R.; Sundaram, R.; Ravi, S.S.; Rosenkrantz, D.J.; Hunt, H.B. III. Los Alamos National Lab., NM (United States). [1994]. 16p. Sponsored by USDOE, Washington,

DC (United States);Department of Defense, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. DARPA Contract N0014-92-J-1799; NSF Grant CCR 92-12184; NSF Gran (CONF-950644–1: Conference on functional programming languages and computer architectures, La Jolla, CA (United States), 26-28 Jun 1995). Order Number DE95005261. Source: OSTI; NTIS; GPO Dep.

We study several bicriteria network design problems phrased as follows: given an undirected graph and two minimization objectives with a budget specified on one objective, find a subgraph satisfying certain connectivity requirements that minimizes the second objective subject to the budget on the first. Define an (α, β)-approximation algorithm as a polynomial-time algorithm that produces a solution in which the first objective value is at most α times the budget, and the second objective value is at most α times the minimum cost of a network obeying the budget oil the first objective. We, present the first approximation algorithms for bicriteria problems obtained by combining classical minimization objectives such as the total edge cost of the network, the diameter of the network and a weighted generalization of the maximum degree of any node in the network. We first develop some formalism related to bicriteria problems that leads to a clean way to state bicriteria approximation results. Secondly, when the two objectives are similar but only differ based on the cost function under which they are computed we present a general parametric search technique that yields approximation algorithms by reducing the problem to one of minimizing a single objective of the same type. Thirdly, we present an O(log n, log n)-approximation algorithm for finding a diameter-constrained minimum cost spanning tree of an undirected graph on n nodes generalizing the notion of shallow, light trees and light approximate shortest-path trees that have been studied before. Finally, for the class of treewidth-bounded graphs, we provide pseudopolynomial-time algorithms for a number of bicriteria problems using dynamic programming. These pseudopolynomial-time algorithms can be converted to fully polynomial-time approximation schemes using a scaling technique.

17375 (LA-UR–95-20) **Periodically specified problems: An exponential complexity gap between exact and approximate solutions.** Hunt, H.B. III (Univ. at Albany, NY (United States). Dept. of Computer Science); Rosenkrantz, D.J.; Stearns, R.E.; Marathe, M.V.; Radhakrishnan, V. Los Alamos National Lab., NM (United States). 28 Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. National Science Foundation Grant CCR 89-03319; Grant CCR 89-052 (CONF-9503122–1: 27. ACM annual symposium on theory of computing (STOC), Livermore, CA (United States), Mar 1995). Order Number DE95009435. Source: OSTI; NTIS; GPO Dep.

We study both the complexity and approximability of various graph and combinatorial problems specified using two dimensional narrow periodic specifications (see [CM93, HW92, KMW67, KO91, Or84b, Wa93]). The following two general kinds of results are presented. (1) We prove that a number of natural graph and combinatorial problems are NEXPTIME- or EXPSPACE-complete when instances are so specified; (2) In contrast, we prove that the optimization versions of several of these NEXPTIME-, EXPSPACE-complete problems have polynomial time approximation algorithms with constant performance guarantees. Moreover, some of these problems even have polynomial time approximation schemes. We also sketch how our NEXPTIME-hardness results can be used to prove analogous NEXPTIME-hardness results for problems specified using other kinds of succinct specification languages. Our results provide the first natural problems for which there is a proven exponential (and possibly doubly exponential) gap between the complexities of finding exact and approximate solutions.

17376 (LA-UR–95-38) **Off-training-set error for the Gibbs and the Bayes optimal generalizers.** Grossman, T. (Los Alamos National Lab., NM (United States)); Knill, E.; Wolpert, D. Los Alamos National Lab., NM (United States). 3 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950778–1: ACM conference on computational learning theory, Santa Cruz, CA (United States), Jul 1995). Order Number DE95006344. Source: OSTI; NTIS; GPO Dep.

In this paper we analyze the average off-training-set behavior of the Bayes-optimal and Gibbs learning algorithms. We do this by exploiting the concept of refinement, which concerns the relationship between probability distributions. For non-uniform sampling distributions the expected off training-set error for both learning algorithms can rise with, training set size. However we show in this paper that for uniform sampling and either algorithm, the expected error is a non-increasing function of training set size. For uniform sampling distributions, we also characterize the priors for which the expected error of the Bayes-optimal algorithm stays constant. In addition we show that when the target function is fixed, expected off-training-set error can increase with training set size if and only if the expected error averaged over all targets decreases with training set size. Our results hold for arbitrary noise and arbitrary loss functions.

17377 (LA-UR–95-423) **Training neural networks using sequential extended Kalman filtering.** Plumer, E.S. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950789–1: 1995 world congress on neural networks, Washington, DC (United States), Jul 1995). Order Number DE95007874. Source: OSTI; NTIS; GPO Dep.

Recent work has demonstrated the use of the extended Kalman filter (EKF) as an alternative to gradient-descent backpropagation when training multi-layer perceptrons. The EKF approach significantly improves convergence properties but at the cost of greater storage and computational complexity. Feldkamp et al. have described a decoupled version of the EKF which preserves the training advantages of the general EKF but which reduces the storage and computational requirements. This paper reviews the general and decoupled EKF approaches and presents sequentialized versions which provide further computational savings over the batch forms. The usefulness of the sequentialized EKF algorithms is demonstrated on a pattern classificatio.ı problem.

17378 (LA-UR–95-883) **Sensor fusion and nonlinear prediction for anomalous event detection.** Hernandez, J.V.; Moore, K.R.; Elphic, R.C. Los Alamos National Lab., NM (United States). 7 Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950472–4: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95009429. Source: OSTI; NTIS; GPO Dep.

The authors consider the problem of using the information from various time series, each one characterizing a different physical quantity, to predict the future state of the system and, based on that information, to detect and classify anomalous events. They stress the application of principal components analysis (PCA) to analyze and combine data from different sensors. They construct both linear and nonlinear predictors. In particular, for linear prediction the authors use the least-mean-square (LMS) algorithm and for nonlinear prediction they use both backpropagation (BP) networks and fuzzy predictors (FP). As an application, they consider the prediction of gamma counts from past values of electron and gamma counts recorded by the instruments of a high altitude satellite.

17379 (LA-UR–95-1117) **Approaches to implementing deterministic models in a probabilistic framework.** Talbott, D.V. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950740–21: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95009483. Source: OSTI; NTIS; GPO Dep.

The increasing use of results from probabilistic risk assessments in the decision-making process makes it ever more important to eliminate simplifications in probabilistic models that might lead to conservative results. One area in which conservative simplifications are often made is modeling the physical interactions that occur during the progression of an accident sequence. This paper demonstrates and compares different approaches for incorporating deterministic models of physical parameters into probabilistic models; parameter range binning, response curves, and integral deterministic models. An example that combines all three approaches in a probabilistic model for the handling of an energetic

material (i.e. high explosive, rocket propellant,...) is then presented using a directed graph model.

17380 (ORNL/TM–12820) **A posteriori pointwise error estimates for the boundary element method.** Paulino, G.H. (Cornell Univ., Ithaca, NY (United States). School of Civil and Environmental Engineering); Gray, L.J.; Zarikian, V. Oak Ridge National Lab., TN (United States). Jan 1995. 39p. Sponsored by USDOE, Washington, DC (United States);Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (CNPq), Sao Paulo, SP (Brazil);National Science Foundation, Washington, DC (United States);Tennessee Univ., Knoxville, TN (United States). DOE Contract AC05-84OR21400. Order Number DE95008099. Source: OSTI; NTIS; GPO Dep.

This report presents a new approach for a posteriori pointwise error estimation in the boundary element method. The estimator relies upon the evaluation of hypersingular integral equations, and is therefore intrinsic to the boundary integral equation approach. This property allows some theoretical justification by mathematically correlating the exact and estimated errors. A methodology is developed for approximating the error on the boundary as well as in the interior of the domain. In the interior, error estimates for both the function and its derivatives (e.g. potential and interior gradients for potential problems, displacements and stresses for elasticity problems) are presented. Extensive computational experiments have been performed for the two dimensional Laplace equation on interior domains, employing Dirichlet and mixed boundary conditions. The results indicate that the error estimates successfully track the form of the exact error curve. Moreover, a reasonable estimate of the magnitude of the actual error is also obtained.

17381 **Stacked generalization.** Wolpert, D.H. To Dept. of Energy. 1993. Filed date 23 Mar 1993. U.S. Patent Application 8-035,837. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009983. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Stacked generalization is used to minimize the generalization errors of one or more generalizers acting on a known set of input values and output values representing a physical manifestation and a transformation of that manifestation, e.g., hand-written characters to ASCII characters, spoken speech to computer command, etc. Stacked generalization acts to deduce the biases of the generalizer(s) with respect to a known learning set and then correct for those biases. This deduction proceeds by generalizing in a second space whose inputs are the guesses of the original generalizers when taught with part of the learning set and trying to guess the rest of it, and whose output is the correct guess. Stacked generalization can be used to combine multiple generalizers or to provide a correction to a guess from a single generalizer.

17382 (PNL-SA–24897) **Visualization of parallel molecular dynamics simulation on a remote visualization platform.** Lee, T.Y. (Washington State Univ., Pullman, WA (United States)); Raghavendra, C.S.; Nicholas, J.B. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409278–4: GVIS '94: graphics and visualization conference, Richland, WA (United States), 8 Sep 1994). Order Number DE95007806. Source: OSTI; NTIS; GPO Dep.

Visualization requires high performance computers. In order to use these shared high performance computers located at national centers, the authors need an environment for remote visualization. Remote visualization is a special process that uses computing resources and data that are physically distributed over long distances. In their experimental environment, a parallel raytracer is designed for the rendering task. It allows one to efficiently visualize molecular dynamics simulations represented by three dimensional ball-and-stick models. Different issues encountered in creating their platform are discussed, such as I/O, load balancing, and data distribution.

17383 (SAND–94-2205C) **Treatment of uncertainties in risk-based regulation.** Camp, A.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950740–2: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95004523. Source: OSTI; NTIS; GPO Dep.

Over the past several years, we have begun to fully appreciate the value of probabilistic risk assessment (PRA) as a decision support tool. Risk assessment has allowed us to focus on problems of real importance and provided discipline to prioritization processes. Many government agencies now consider risk assessment as a normal and essential element of their decision making. Due to the inherent uncertainty in the results, use of absolute PRA numbers to make specific decisions was not encouraged by risk assessment experts in the past. The current trend , however, is to make more and more use of the absolute numbers and (in some cases) to use them directly to make regulatory decisions. Whether or not we approve of this trend, it will almost certainly continue. Therefore, it is incumbent upon risk assessment experts to provide information to decision-makers that is properly characterized. This characterization should include a clear presentation of the uncertainties involved in the risk estimates. Uncertainty analysis is often considered undesirable by decision-makers, because it muddies up the waters of an other-wise clear cut decision.

17384 (SAND–94-3129C) **A simple and efficient procedure for polyhedral assembly partitioning under infinitesimal motions.** Guibas, L.J. (Stanford Univ., CA (United States)); Halperin, D.; Latombe, J.C.; Hirukawa, Hirohisa; Wilson, R.H. Sandia National Labs., Albuquerque, NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Grant IRI-9306544; Grant CCR-9215219. (CONF-9505193–4: 1995 international conference on robotics and automation, Nagoya (Japan), 21-27 May 1995). Order Number DE95009838. Source: OSTI; NTIS; GPO Dep.

The authors study the following problem: given a collection A of polyhedral parts in 3D, determine whether there exists a subset S of the parts that can be moved as a rigid body by an infinitesimal translation and rotation, without colliding with the rest of the parts, A/S. A negative result implies that the object whose constituent parts are the collection A cannot be taken apart with two hands. A positive result, together with the list of movable parts in S and a direction of motion for S, can be used by an assembly sequence planner. This problem has attracted considerable attention within and outside the robotics community. They devise an efficient algorithm to solve this problem. The solution is based on the ability to focus on selected portions of the tangent space of rigid motions and efficiently access these portions. The algorithm is complete (in the sense that it is guaranteed to find a solution if one exists), simple, and improves significantly over the best previously known solutions. The authors report experimental results with an implementation of their algorithm.

17385 (SAND–95-0140C) **Distributed multitasking ITS with PVM.** Fan, W.C.; Halbleib, J.A. Sr. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950601–3: Annual meeting of the American Nuclear Society, Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95006821. Source: OSTI; NTIS; GPO Dep.

Advances of computer hardware and communication software have made it possible to perform parallel-processing computing on a collection of desktop workstations. For many applications, multitasking on a cluster of high-performance workstations has achieved performance comparable or better than that on a traditional supercomputer. From the point of view of cost-effectiveness, it also allows users to exploit available but unused computational resources, and thus achieve a higher performance-to-cost ratio. Monte Carlo calculations are inherently parallelizable because the individual particle trajectories can be generated independently with minimum need for interprocessor communication. Furthermore, the number of particle histories that can be generated in a given amount of wall-clock time is nearly proportional to the number of processors in the cluster. This is an important fact because the inherent statistical uncertainty in any Monte Carlo result decreases as the number of histories increases. For these reasons, researchers have expended considerable effort to take advantage of different parallel architectures for a variety of Monte Carlo radiation transport codes, often with excellent results. The initial interest in

this work was sparked by the multitasking capability of MCNP on a cluster of workstations using the Parallel Virtual Machine (PVM) software. On a 16-machine IBM RS/6000 cluster, it has been demonstrated that MCNP runs ten times as fast as on a single-processor CRAY YMP. In this paper, we summarize the implementation of a similar multitasking capability for the coupled electron/photon transport code system, the Integrated TIGER Series (ITS), and the evaluation of two load balancing schemes for homogeneous and heterogeneous networks.

17386 (SAND–95-0349C) **Evaluation of nonlinear structural dynamic responses using a fast-running spring-mass formulation.** Benjamin, A.S.; Altman, B.S.; Gruda, J.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950788–2: International conference on computational engineering science, Mauna Lani, HI (United States), 30 Jul - 3 aug 1995). Order Number DE95008503. Source: OSTI; NTIS; GPO Dep.

In today's world, accurate finite-element simulations of large nonlinear systems may require meshes composed of hundreds of thousands of degrees of freedom. Even with today's fast computers and the promise of ever-faster ones in the future, central processing unit (CPU) expenditures for such problems could be measured in days. Many contemporary engineering problems, such as those found in risk assessment, probabilistic structural analysis, and structural design optimization, cannot tolerate the cost or turnaround time for such CPU-intensive analyses, because these applications require a large number of cases to be run with different inputs. For many risk assessment applications, analysts would prefer running times to be measurable in minutes. There is therefore a need for approximation methods which can solve such problems far more efficiently than the very detailed methods and yet maintain an acceptable degree of accuracy. For this purpose, we have been working on two methods of approximation: neural networks and spring-mass models. This paper presents our work and results to date for spring-mass modeling and analysis, since we are further along in this area than in the neural network formulation. It describes the physical and numerical models contained in a code we developed called STRESS, which stands for "Spring-mass Transient Response Evaluation for structural Systems". The paper also presents results for a demonstration problem, and compares these with results obtained for the same problem using PRONTO3D, a state-of-the-art finite element code which was also developed at Sandia.

17387 (SAND–95-0492C) **The role of advanced engineering simulation in model-based design.** Hommert, P.J. (Sandia National Labs., Albuquerque, NM (United States). Engineering Sciences Center); Biffle, J.H. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503112–2: Agile Manufacturing conference (AMC '95), Albuquerque, NM (United States), 16-17 Mar 1995). Order Number DE95008815. Source: OSTI; NTIS; GPO Dep.

The agile manufacturing paradigm engenders many new concepts and work approaches for manufacturing operations. A technology often invoked in the concept of agility is modeling and simulation. Few would disagree that modeling and simulation holds the potential to substantially reduce the product development cycle and lead to improve product reliability and performance. Advanced engineering simulation can impact manufacturing in three areas: process design, product design, and process control. However, despite that promise, the routine utilization of modeling and simulation by industry within the design process is very limited. Advanced simulation is still used primarily in a troubleshooting mode examining design or process problems after the fact. Sandia National Laboratories has been engaged in the development of advanced engineering simulation tools for many years and more recently has begun to focus on the application of such models to manufacturing processes important for the defense industry. These efforts involve considerable interaction and cooperative research with US industry. Based upon this experience, this presentation examines the elements that are necessary for advanced engineering simulation to become an integral part of the design process.

17388 (SAND–95-0501C) **Toward a risk-based approach to the assessment of the surety of information systems.** Wyss, G.D.; Fletcher, S.K.; Halbgewachs, R.D.; Jansma, R.M.; Lim, J.J.; Murphy, M.; Sands, P.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950740–14: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95008821. Source: OSTI; NTIS; GPO Dep.

Traditional approaches to the assessment of information systems have treated system security, system reliability, data integrity, and application functionality as separate disciplines. However, each areas requirements and solutions have a profound impact on the successful implementation of the other areas. A better approach is to assess the "surety" of an information system, which is defined as ensuring the "correct" operation of an information system by incorporating appropriate levels of safety, functionality, confidentiality, availability, and integrity. Information surety examines the combined impact of design alternatives on all of these areas. We propose a modelling approach that combines aspects of fault trees and influence diagrams for assessing information surety requirements under a risk assessment framework. This approach allows tradeoffs to be based on quantitative importance measures such as risk reduction while maintaining the modelling flexibility of the influence diagram paradigm. This paper presents an overview of the modelling method and a sample application problem.

17389 (SAND–95-0590C) **Encryption and networking applications.** Long, J.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505191–2: 17. Department of Energy computer security group training conference, Milwaukee, WI (United States), 1-4 May 1995). Order Number DE95009587. Source: OSTI; NTIS; GPO Dep.

The DOE requires that sensitive unclassified data be protected while being transmitted electronically. On most large networks it is difficult and expensive to provide the required level of physical protection. At Sandia National Laboratories, we are assembling the structure necessary to protect sensitive unclassified data using software-based encryption. This approach has the advantage that the data can be protected after arrival at its destination without additional investment While Sandia has expertise in cryptography, we had not used cryptography in this field. This discussion deals with the client-server model of file-based data exchange and interactive access to on-line data bases using Unix workstations, Macs and PCs.

17390 (SAND–95-8100) **Estimation in second order dependency model for multivariate binary data.** Ip, E.H.S. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010326. Source: OSTI; NTIS; GPO Dep.

This paper proposes a normal model for multivariate binary data. The normal model is an extension to the bivariate normal model for 2×2 contingency table proposed by Pearson. A stochastic algorithm using Gibbs sampler is developed to estimate the parameters for high dimensional binary data. The method is compared to the second order dependency Bahadur-Lazarsfeld representation of binary density. Two examples, one from psychological testing and one from medical science, are used to substantiate the above ideas.

17391 (SAND–95-8101) **A stochastic difference equation approach to inference with missing data: Some new results.** Ip, E.H.S. (Stanford Univ., CA (United States). Dept. of Statistics); Diebolt, J. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010327. Source: OSTI; NTIS; GPO Dep.

This paper is concerned with the study of the properties of the Stochastic EM estimator. The Stochastic EM estimator is an estimator derived from an iterative algorithm which handles statistical model with missing data. The first result we obtain is on the decomposition of a general stochastic difference equation underlying the Stochastic EM iterates into an additive form. Such decomposition allows a further analysis of the Markov chain underlying the

Stochastic EM algorithm. The second result indicates that the Stochastic EM estimator differs from the maximum likelihood estimate by O (1/n) where n is the sample size. It also shows that iterates derived from the additive stochastic difference equation converges to a normal distribution which is centered at the true value of the parameter as n → ∞.

17392 (SAND–95-8102) **A Stochastic EM algorithm for approximating the maximum likelihood estimate.** Diebolt, J. (Stanford Univ., CA (United States). Dept. of Statistics); Ip, E.H.S. Sandia National Labs., Livermore, CA (United States). Mar 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010328. Source: OSTI; NTIS; GPO Dep.

Stochastic EM is an algorithm designed to handle missing data in statistical applications. Instead of performing the expectation step in the Expectation-Maximization (EM) algorithm, Stochastic EM impute a sample value drawn from the conditional distribution of the missing data given the parameter. This paper explains how the algorithm can be applied in statistical inference to avoid numerical integrations and presents two examples using the Stochastic EM algorithm. The first example deals with censored Weibull data and the second example deals with an empirical Bayes model that arises in educational testing. Some variants of the algorithm are also discussed. This report only treats the theory underlying the Stochastic EM briefly. The properties of the Stochastic EM estimates are dealt with in depth in a sequel of this report.

17393 (SAND–95-8103) **A stochastic EM estimator in the presence of missing data - theory and applications.** Ip, E.H.S. (Stanford Univ., CA (United States). Dept. of Statistics). Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 116p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010329. Source: OSTI; NTIS; GPO Dep.

This thesis provides a study of a Monte Carlo version of the EM (for Expectation-Maximization) algorithm for handling complex missing-data structure in which high-dimensional integrations may be involved. Assuming a parametric model for the complete data, we propose a method for imputing values for missing data and then iteratively perform direct parametric inference based on the pseudo-complete data. If the iteration converges, the result of the procedure is a sample from a stationary distribution derived from the Markov chain formed by the iterations of the parameter. This algorithm is called Stochastic EM and the estimator we propose is the mean of the stationary distribution. We provide new theoretical results on the Stochastic EM estimator. First, under an exponential family setting, we show that asymptotically the Markov chain kernel of Stochastic EM can be decomposed into an additive stochastic difference equation. This decomposition allows us to provide useful results for the asymptotic behavior of the stationary distribution under specific conditions. The next result we obtain is that the Stochastic EM estimator is close to the maximum likelihood estimate. Another result shows that asymptotically the Stochastic EM iterations converge to a normal distribution with the true parameter as its mean. Bounds are obtained for the norm of the covariance matrix. There are two examples, one from medical science and one from education to substantiate the theory. In the education example, the use of straightforward EM would require performing an overwhelmingly large number of high-dimensional numerical integrations even for a moderate sample of a thousand multivariate binary observations.

17394 (SAND–95-8211) **Video conferencing using DAVE user's guide.** Friesen, J.A. Sandia National Labs., Livermore, CA (United States). Mar 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010341. Source: OSTI; NTIS; GPO Dep.

This guide is intended to provide information to new users of Sandia National Laboratories Distributed Audio Video Environment (DAVE) applications.

17395 (SAND–95-8218) **Congestion control over ATM local area networks.** Chen, H.Y.; Fang, C.; Hutchins, J.A. Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010343. Source: OSTI; NTIS; GPO Dep.

Asynchronous Transfer Mode (ATM) has emerged as a standard which offers integration of different classes of service as well as scalability in terms of network size and speed. While the early focus on ATM was mainly on wide-area networks, the driving force behind this new technology is increasingly coming from local-area applications. The need for an ATM LAN to support existing protocols (e.g., TCP/IP) transparently is key to its adoption in the local-area environment. In traditional shared medium LANS, congestion control on the medium is handled by medium access control (MAC) protocol. Once a network device gains access to the shared medium, it has the full bandwidth to itself. Other contending network devices must wait until the shared medium becomes free. In ATM LANS, the MAC protocol is removed, and as a result the congestion control it provides is also removed. Each network device can transmit at the full link bandwidth, and can thus potentially cause congestion at some output ports of an ATM switch. This report presents some simulation results and demonstrates the importance of congestion control in ATM networks. First, we show the effects of cell loss on TCP performance in a congested ATM LAN. When congestion results in switch buffer overflow, cells are dropped. The effect of a small cell loss rate is found to translate into a much larger TCP packet retransmission rate, resulting in poor TCP performance. Secondly, we will describe a credit-based, per virtual circuit, per hop flow control algorithm proposed by Digital Equipment Corporation (DEC). We show that when flow control is employed, cell loss and TCP retransmissions are eliminated, resulting in greatly improved TCP performance.

17396 (SAND–95-8220) **A modification to the GMRES method for ill-conditioned linear systems.** Meza, J.C. Sandia National Labs., Livermore, CA (United States). Apr 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010661. Source: OSTI; NTIS; GPO Dep.

This paper concerns the use of a method for the solution of ill-conditioned linear systems. We show that the Generalized Minimum Residual Method (GMRES) in conjunction with a truncated singular value decomposition can be used to solve large nonsymmetric linear systems of equations which are nearly singular. Error bounds are given for the right singular vectors and singular values computed. A consequence of the error bounds results in a method for computing some of the singular values and right singular vectors for large matrices.

17397 (SINS–2153/8) **The Monte Carlo event generator for modelling the coherence and chaos in high energy hadronic and nuclear collisions.** Wilk, G. (Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland)); Wlodarczyk, Z.; Weiner, R.M. Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland). Sep 1993. 32p. Order Number DE95628887. Source: OSTI; NTIS; INIS.

The quantum statistical concepts of coherence and chaos used to describe fluctuations in multiparticle production processes are exhibited in a generalized version of the Interacting Gluon Model (IGM). The two components in the multiplicity distributions found previously are derived in this approach as originating from the two components of the energy flow existing in the IGM: the one provided by the interacting gluons and the other containing the initial valence quarks of the projectiles. The first Monte Carlo event generator with coherence and chaos built in is then presented and successfully used to describe the pp and p p-bar data. It is then generalized to hA and AA collisions and compared with data. (author). 62 refs, 16 figs, 1 tab.

17398 (SKB-TR–94-21) **Verification of HYDRASTAR: Analysis of hydraulic conductivity fields and dispersion.** Morris, S.T. (AEA Technology, Harwell (United Kingdom)); Cliffe, K.A. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Oct 1994. 74p. Order Number DE95627100. Source: OSTI; NTIS; INIS.

HYDRASTAR is a code for the stochastic simulation of groundwater flow. It can be used to simulate both time-dependent and steady-state groundwater flow at constant density. Realizations of the hydraulic conductivity field are generated using the Turning Bands algorithm. The realizations can be conditioned on measured

values of the hydraulic conductivity using Kriging. This report describes a series of verification studies that have been carried out on the code. The first study concerns the accuracy of the implementation of the Turning Bands algorithm in HYDRASTAR. The implementation has been examined by evaluating the ensemble mean and covariance of the generated fields analytically and comparing them with their prescribed values. Three other studies were carried out in which HYDRASTAR was used to solve problems of uniform mean flow and to calculate the transport and dispersion of fluid particles. In all three cases the hydraulic conductivity fields were unconditioned. The first two were two-dimensional: one at small values of the variance of the logarithm of the hydraulic conductivity for which there exists analytical results that the code can be compared with, and one at moderate variance where the results can only be compared with those obtained by another code. The third problem was three dimensional with a small variance and again analytical results are available for comparison. 14 refs, 24 figs.

17399 (SKB-TR–94-22) **Evaluation of stationary and non-stationary geostatistical models for inferring hydraulic conductivity values at Aespoe.** La Pointe, P.R. (Golder Associates Inc., Seattle, WA (United States)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Nov 1994. 92p. Order Number DE95627101. Source: OSTI; NTIS; INIS.

This report describes the comparison of stationary and non-stationary geostatistical models for the purpose of inferring block-scale hydraulic conductivity values from packer tests at Aespoe. The comparison between models is made through the evaluation of cross-validation statistics for three experimental designs. The first experiment consisted of a 'Delete-1' test previously used at Finnsjoen. The second test consisted of 'Delete-10%' and the third test was a 'Delete-50%' test. Preliminary data analysis showed that the 3 m and 30 m packer test data can be treated as a sample from a single population for the purposes of geostatistical analyses. Analysis of the 3 m data does not indicate that there are any systematic statistical changes with depth, rock type, fracture zone vs non-fracture zone or other mappable factor. Directional variograms are ambiguous to interpret due to the clustered nature of the data, but do not show any obvious anisotropy that should be accounted for in geostatistical analysis. Stationary analysis suggested that there exists a sizeable spatially uncorrelated component ('Nugget Effect') in the 3 m data, on the order of 60% of the observed variance for the various models fitted. Four different nested models were automatically fit to the data. Results for all models in terms of cross-validation statistics were very similar for the first set of validation tests. Non-stationary analysis established that both the order of drift and the order of the intrinsic random functions is low. This study also suggests that conventional cross-validation studies and automatic variogram fitting are not necessarily evaluating how well a model will infer block scale hydraulic conductivity values. 20 refs, 20 figs, 14 tabs.

17400 (UCRL-CR–114243) **DOE Integrated Security System (DISS) preliminary communication security analysis.** Sweeney, D.J. Lawrence Livermore National Lab., CA (United States). Oct 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009527. Source: OSTI; NTIS; GPO Dep.

The purpose of this analysis is to document a technical approach to improve DOE Integrated Security System (DISS) dial-up communications security and the requirements to address them. This document is not intended as a comprehensive analysis of the security aspects of the DISS computer system but rather as an analysis of the dial-up communications security as it pertains to the use of the DISS database in the new DOE Automated Visitors Access Control System (DAVACS) procedures. Current access controls into the DISS will be discussed with emphasis on the DAVACS procedures. Recommendations will be provided for increasing the dial-up communications security into DISS as it relates to the automated visit procedures. Finally a design for an encrypted dial-up communication link to DISS will be given.

17401 (UCRL-JC–116695) **Image enhancement by edge-preserving filtering.** Wong, Yiu-fai. Lawrence Livermore National Lab., CA (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411104–3: Institute of Electrical and Electronics Engineers (IEEE) international conference on image processing, Austin, TX (United States), 13-16 Nov 1994). Order Number DE95008077. Source. OSTI; NTIS; GPO Dep.

Image enhancement is useful when the details in an image are lost due to various reasons. It is common to subtract a mask from a given image to enhance the details. The trick is how to obtain a good mask. We describe here how an edge-preserving filter can be used to generate a mask which is smooth over areas with fine details, yet preserving most of the edges. Experiments with real images show that our scheme is very effective.

17402 (UCRL-JC–119529) **Implementation and performance of the pseudoknot problem in sisal.** Feo, J. (Lawrence Livermore National Lab., CA (United States)); Ivory, M. Lawrence Livermore National Lab., CA (United States). Dec 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504126–1: High performance functional computing, Denver, CO (United States), 9-11 Apr 1995). Order Number DE95009573. Source: OSTI; NTIS; GPO Dep.

The Pseudoknot Problem is an application from molecular biology that computes all possible three-dimensional structures of one section of a nucleic acid molecule. The problem spans two important application domains: it includes a deterministic, backtracking search algorithm and floating-point intensive computations. Recently, the application has been used to compare and to contrast functional languages. In this paper, we describe a sequential and parallel implementation of the problem in Sisal. We present a method for writing recursive, floating-point intensive applications in Sisal that preserves performance and parallelism. We discuss compiler optimizations, runtime execution, and performance on several multiprocessor systems.

17403 (UCRL-JC–119773) **Automated volumetric grid generation for finite element modeling of human hand joints.** Hollerbach, K. (Lawrence Livermore National Lab., CA (United States)); Underhill, K.; Rainsberger, R. Lawrence Livermore National Lab., CA (United States). Feb 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506173–1: 1995 ASME summer bioengineering conference, Beaver Creek, CO (United States), 28 Jun - 2 jul 1995). Order Number DE95009575. Source: OSTI; NTIS; GPO Dep.

We are developing techniques for finite element analysis of human joints. These techniques need to provide high quality results rapidly in order to be useful to a physician. The research presented here increases model quality and decreases user input time by automating the volumetric mesh generation step.

17404 (UCRL-JC–119879) **Visualization methods for high-resolution, transient, 3-D, finite element situations.** Christon, M.A. Lawrence Livermore National Lab., CA (United States). 10 Jan 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9401114–1: International workshop on visualization, Paderborn (Germany), 18-20 Jan 1994). Order Number DE95009479. Source: OSTI; NTIS; GPO Dep.

Scientific visualization is the process whereby numerical data is transformed into a visual form to augment the process of discovery and understanding. Visualizing the data generated by large-scale, transient, three-dimensional finite element simulations poses many challenges due to geometric complexity, the presence of multiple materials and multiple element types, and the inherent unstructured nature of the meshes. In this paper, the direct use of finite element data structures, nodal assembly procedures, and element interpolants for volumetric adaptive surface extraction, surface rendering, vector grids and particle tracing is discussed. A brief description of a "direct-to-disk" animation system is presented, and case studies which demonstrate the use of isosurfaces, vector plots, cutting planes, reference surfaces and particle tracing are then discussed in the context of several case studies for transient incompressible viscous flow, and acoustic fluid-structure interaction simulations. An overview of the implications of massively parallel computers on visualization is presented to highlight the issues in parallel visualization methodology, algorithms. data locality and the

ultimate requirements for temporary and archival data storage and network bandwidth.

17405 (CRIE-R–93010) **Development of customer information network system research on remote operation for customer.** Yoshimitsu, T. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Suzuki, T. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 24p. (In Japanese). Order Number DE95769746. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

A discussion was given on a customer-based information network to perform automatic meter-reading and provide information to electric power companies. As a first step, remote processing of operations accompanying visits was discussed as to methods of confirming and processing the operations. As a result, it was found that the following items may be performed by the remote processing: reading the power meters, notification of amount of power used and the power charge, processing such changes that are caused by house moving, handling of power failures in low voltage systems and inside the users' houses, requests on unpaid power charges, power transmission shutdown, resumption of power transmission, supply voltage measurement according to the electric power business law, insulation resistance survey in small users' houses, power leakage investigations, changes in the contract contents, and survey on work completion. In executing these items, it was thought necessary to have communicating functions for measuring voltages and currents and automatic meter-reading, as well as information exchange with customers. Remotely processing such events as handling power failures in low voltage systems, and changes in the contract capacity processed previously at the customers' place would be possible by monitoring and controlling different breakers. An image has been prepared for structures and functions for a system at users' ends for remote processing. 11 refs., 4 figs., 6 tabs.

17406 (CRIE-R–93011) **Utility broad-band network architecture and its OAM. Part 1.** Fukuda, M. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Kondo, T.; Horizawa, T.; Okamura, K.; Oba, E.; Inoue, Y. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 82p. (In Japanese). Order Number DE95769741. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

With an objective to install an ATM communications network for the future power transmission, investigations were made on the research trends in structuring the communications networks by means of the ATM transmission and exchange systems, and discussions were given on problems that the electric power companies should solve. The result of the investigation on the research trends on the ATM network revealed that the investigation placed the main point on the quality and flexibility of the communications, and more research is required on the necessary reliability of the power communications. Since the reliability required on each classified virtual path varies with respect to the method of evaluating the reliability in the power ATM communications network, it was found necessary that the reliability on impediment resistance and operation factors be evaluated on each virtual path network. It was made clear that the control technologies being studied for the public network may be applied to the traffic control. It was also disclosed that the operation and management of the power communications network require expansion in functions for the operation patterns and control systems characteristic to electric power. Furthermore, for the necessity in verifying the communication quality, a traffic investigation was carried out on the current power communications network. 57 refs., 26 figs., 11 tabs.

17407 (CRIE-R–93014) **Study of reliability evaluation on configuration of utility communication network.** Oba, E. (Central Research Institute of Electric Power Industry, Tokyo (Japan)). Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 23p. (In Japanese). Order Number DE95769744. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

A discussion was given on indexes to accurately evaluate the reliability of a utility communication network, and a program to calculate the reliability was developed. The discussion was made on a method in which a utility communication network was expressed as a graph composed of nodes and links, and a physical network evaluated the reliability against impediments when expressed as described above. As a result, degrees of the linkage and the bonds were selected to express how many impediments that occur simultaneously the network can withstand to maintain the linkage of the communication network; a probability that communications are possible among all of the two nodes was used as an overall reliability to express quantitatively the degree of achievement of the communicating functions in the network when an impediment has occurred; and the ratio that shows how many sets of the nodes that are capable of communications during impediments remain was used as the functional operation factor. A program was developed to calculate the degrees of linkage and bond, the overall reliability, and the functional operation factor. A model network was used to calculate the effect of reliability improvement when links are added. 9 refs., 12 figs., 7 tabs.

17408 (DOE/ER/25063–T14) **Supporting data intensive applications with medium grained parallelism. Final report, July 1991–June 1994.** Pfaltz, J.L.; French, J.C.; Grimshaw, A.S.; Son, S.H. Virginia Univ., Charlottesville, VA (United States). School of Engineering and Applied Science. Jul 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER25063. (UVA–527437/CS95/101). Order Number DE95010164. Source: OSTI; NTIS; GPO Dep.

The purpose of this second three year grant was to investigate opportunities for medium grained parallelism in data intensive applications; or more succinctly, can one create effective parallel database systems? It should be noted that the last three years have not been kind to parallel object-oriented database systems – to their knowledge none of those that have been implemented has been particularly effective. Nevertheless, this research has been some of the most successful that the principal investigators have conducted. One reason is that the authors took a multi-way approach. In consequence, they seem to have made far more progress than comparable research groups. A second, implicit goal was to complete the innovative functional, object-oriented database language and system, called ADAMS, and to demonstrate its performance in a parallel environment. Thus the overall agenda was (a) to create new mechanisms that exploit parallel computing power, (b) install it in ADAMS, and (c) analyze its behavior. It will be seen, that while they did come up with several new innovative ideas which they thoroughly tested, they did not always have time to install them into the run-time ADAMS library. Although the authors proposed rewriting their storage manager to take advantage of the Concurrent File System (CFS) on the Intel iPSC/2, they did not. During the grant period, the Computer Science Department acquired a dedicated cluster of 8 SPARC 10's. Gradually the hypercube implementation has been phased out, and replaced by that on the SPARC cluster.

17409 (DOE/MC/29467–3986) **Management, visualization, and analysis of environmental and geotechnical data. Topical report.** West Virginia Univ. Research Corp., Morgantown, WV (United States). Sep 1994. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE95000063. Source: OSTI; NTIS; GPO Dep.

This document is a topical report evaluating current technology on the management, visualization, and analysis of engineering and environmental data. This report gives an overview and assessment of the Integrated Computer Assisted Site Evaluation /Graphical Remedial Assessment and Cost Evaluation (ISACE/GRACE) system and includes brief descriptions of the Environmental Technology

'94: Computing and Information Conference and the National Conference on Environmental Problem Solving with GIS.

17410 (DOE/NV/10872–T176) **Adaptive image enhancement of text images that contain touching or broken characters.** Stubberud, P.; Kalluri, V.; Kanai, J. Nevada Univ., Las Vegas, NV (United States). 29 Nov 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE95010173. Source: OSTI; NTIS; GPO Dep.

Text images that contain touching or broken characters can significantly degrade the accuracy of optical character recognition (OCR) systems. This paper proposes an adaptive image restoration technique that can improve OCR accuracy by enhancing touching or broken character images. The technique begins by processing a distorted text image with an OCR system. Using the distorted text image and output information from the OCR system, an inverse model of the distortion that caused the touching or broken character problem is generated. After generating the inverse model, the unrecognized distorted characters are filtered by the inverse model and then processes by the OCR system. To demonstrate its feasibility, six distorted text images were processed using this technique. Four of the text images, two with touching characters and two with broken characters, were synthesized using mathematical distortion models. The remaining two distorted text images, one with touching characters and one with broken characters, were distorted using a photocopier. The performance of the adaptive image restoration technique was measured using pixel accuracy and OCR improvement. The examples demonstrate that this technique can improve both the pixel and OCR accuracy of text images containing touching or broken characters.

17411 (IAEA-NDS–107(rev.9)) **Index to BROND-2, CENDL-2, ENDF/B-6, JEF-2, JENDL-3, IRDF.** IAEA-NDS-Documentation series, IAEA-NDS-Documentation series. Lemmel, H.D. International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section. Jul 1994. 19p. Order Number DE95628876. Source: OSTI; NTIS (US Sales Only); INIS.

This document contains a brief index to the five main data libraries for evaluated neutron reaction data, including BROND-2 from USSR (1992 update), CENDL-2 from China (1993 version), ENDF/B-6 from USA (including 1993 revisions), JEF-2 from OECD/NEA (1992) and JENDL-3.2 (1994) from Japan. It also indexes IRDF-90, the International Reactor Dosimetry File from IAEA (1993 update), and the available data libraries for fission-product yield data. (author).

17412 (IAEA-NDS–150(rev.94/9)) **Online nuclear data service.** IAEA-NDS-Documentation series, IAEA-NDS-Documentation series. Dunford, C.L. (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section); Burrows, T.W. International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section. 1994. 90p. Order Number DE95628877. Source: OSTI; NTIS (US Sales Only); INIS.

The US National Nuclear Data Center and the IAEA Nuclear Data Section offer online computer access through international networks to their nuclear-physics and photo-atomic numeric databases, related bibliographic systems and other related information of interest to basic and applied research and technology. A detailed description of the access procedures, the technical requirements, and the available databases is given. (author).

17413 (IAEA-SM–317) **Opening statement by the scientific secretary.** Todeschini, C. (International Atomic Energy Agency, Vienna (Austria). INIS Section). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 12p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628860. Source: OSTI; NTIS (US Sales Only); INIS.

The International Symposium on the Future of Scientific, Technological and Industrial Information Services was co sponsored by four International Organizations: IAEA, FAO, UNESCO and UNIDO. The involvement of each of these Organizations in information transfer activities is described. The main three themes of the symposium: Information needs of users, Information retrieval and dissemination systems, Information management and strategy, are briefly presented.

17414 (IAEA-SM–317/1) **Evolution of scientific and technological documentation services at ENEA.** Sano, A. (ENEA, Rome (Italy)); Li Puma, G. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 10p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628861. Source: OSTI; NTIS (US Sales Only); INIS.

The expected evolution of documentation and information Centers in research Organizations is presented, on the base of experience matured at ENEA (Italy) in this field. The growth of the available information, consequent to the integration of different information systems, to the realization of library network, to the increase of on-line data bases, the evolution of interfaces between information and users, and the growth of the capacity of Centers to understand in depth the information they manage (capability to analyse, validate and elaborate the data), represents the main aspects of the evolution of this sector. The role of Centers is then changing shifting gradually from the management of documentation to the management of information. New professional skills are therefore necessary in the Centers. Competences in computer science and in other areas of major interest to the Organization are requested. In this way the Centers tend to become an active information point reference in the life of the Organization and have a specific role of notable interest and responsibility. (author). 3 figs.

17415 (IAEA-SM–317/4) **Conversion and distribution of bibliographic information for further use on microcomputers with database software such as CDS/ISIS.** Nieuwenhuysen, P. (Vrije Univ., Brussels (Belgium)); Besemer, H. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 6p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628866. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes methods to work on microcomputers with data obtained from bibliographic and related databases distributed by online data banks, on CD-ROM or on tape. Also, we mention some user reactions to this technique. We list the different types of software needed to perform these services. Afterwards, we report about our development of software, to convert data so that they can be entered into UNESCO's program named CDS/ISIS (Version 2.3) for local database management on IBM microcomputers or compatibles; this software allows the preservation of the structure of the source data in records, fields, subfields and field occurrences. (author). 10 refs, 1 fig.

17416 (IAEA-SM–317/7) **Toward common working tools: Arab League Documentation and Information Centre experience.** Redissi, M. (ALDOC (Tunisia)). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 16p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628874. Source: OSTI; NTIS (US Sales Only); INIS.

The adoption of Arab common working tools in information handling has been one of the priorities of Arab League Documentation and Information Centre (ALDOC). Problems arising from the processing of Arabic language have been progressively settled. The Tunisian experience in the elimination of transliteration is worth mentioning. (author). 17 refs.

17417 (IAEA-SM–317/10) **The use of CD-ROMs for storage and document delivery at the British Library Document Supply Centre.** Bradbury, D. (British Library Document Supply Centre, Boston SPA (United Kingdom)). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 12p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628862. Source: OSTI; NTIS (US Sales Only); INIS.

The British Library Document Supply Centre (BLDSC) has been in the forefront of international document delivery for 20 years. During the last 5 years it has been very actively involved in the ADONIS Project, through which the full text of some 200 journals in the life sciences have been stored, accessed, and delivered through the medium of CD-ROM. The BLDSC's involvement in this project is described and indications of the lessons learned and of the implications for international document delivery systems in the future are given. (author).

17418 (IAEA-SM–317/11) **Spectroscopic databases - A tool for structure elucidation.** Luksch, P. (Fachinformationszentrum Karlsruhe, Gesellschaft fuer Wissenschaftlich-Technische Information mbH, Eggenstein-Leopoldshafen (Germany)). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 12p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628878. Source: OSTI; NTIS (US Sales Only); INIS.

Spectroscopic databases have developed to useful tools in the process of structure elucidation. Besides the conventional library searches, new intelligent programs have been added, that are able to predict structural features from measured spectra or to simulate for a given structure. The example of the C13NMR/IR database developed at BASF and available on STN is used to illustrate the present capabilities of online database. New developments in the field of spectrum simulation and methods for the prediction of complete structures from spectroscopic information are reviewed. (author). 10 refs, 5 figs.

17419 (IAEA-SM–317/14) **Information needs of engineers. The methodology developed by the WFEO Committee on Engineering Information and the use of value analysis for improving information services.** Darjoto, S.W. (Indonesian Inst. of Sciences, Bandung (Indonesia)); Martono, A.; Michel, J. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 9p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628863. Source: OSTI; NTIS (US Sales Only); INIS.

The World Federation of Engineering Organizations - WFEO - through the work of its Committee on Engineering Information, aims at improving the efficiency of engineers and particularly at developing new attitudes and practices concerning the specialized information mastering. One important part of the WFEO/CEI programme of activities during the last years and for the next years was and is devoted to a better understanding of the information needs of engineers. But also, it seems now essential to WFEO/CEI to better evaluate information services in order to correctly adapt them to the identified needs of engineers. The following communication will emphasize these two main and related perspectives: identifying the information needs of engineers; developing Value Analysis approaches for engineering information services. (author). 3 refs.

17420 (IAEA-SM–317/29) **Information retrieval and services with the help of the ASPID–5/ES and ASPID-7/SM software for mainframe or mini-computer.** Grigyanets, R.V. 17427 (IAEA-SM–317/56) **Multilingual indexing and retrieval in bibliographic retrieval systems: The AGRIS experience.** Bonnichon, M.; Lebowitz, A.I.; Portegies Zwart, R.; Schmid, H. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 8p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628872. Source: OSTI; NTIS (US Sales Only); INIS.

In the field of agriculture, experience with AGRIS has shown that the language barrier is among thr greatest obstacles to preparing input to the database as well as to using its output products. The implementation of the multilingual thesaurus AGROVOC in AGRIS is described in this paper.

17428 (IAEA-SM–317/57) **Interaction between national and international information systems: The case of AGRIS and CARIS.** Samaha, E.K. (Food and Agriculture Organization of the United Nations, Rome (Italy). Library and Documentation Systems Div.). International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 3p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628880. Source: OSTI; NTIS (US Sales Only); INIS.

The international cooperative information system as exemplified by IAEA's INIS and FAO's AGRIS and CARIS is based on national partnership. A unique type of interaction exists between this system and national systems. This paper outlines this relationship with examples drawn from AGRIS and CARIS, and looks at future prospects in the 1990s.

17429 (IAEA-SM–317/58) **Expert system for quality control in the INIS database.** Todeschini, C. (International Atomic Energy Agency, Vienna (Austria)); Tolstenkov, A. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 17p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628881. Source: OSTI; NTIS (US Sales Only); INIS.

An expert system developed to identify input items to INIS database with a high probability of containing errors is described. The system employs a Knowledge Base constructed by the interpretation of a large number of intellectual choices or expert decisions made by human indexers and incorporated in the INIS database. On the basis of the descriptor indexing, the system checks the correctness of the categorization. A notable feature of the system is its capability of self improvement by the continuous updating of the Knowledge Base. The expert system has also been found to be extremely useful in identifying documents with poor indexing. 3 refs, 9 figs.

17430 (IAEA-SM–317/63) **User needs in chemical information.** Lehmann, H. (FIZ Chemie GmbH, Berlin (Germany)); Poetzscher, G.; Wilson, A.J.C. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 25p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628873. Source: OSTI; NTIS (US Sales Only); INIS.

Information has become an absolutely indispensable factor in the modern industrial society. In chemistry, detailed information about all compounds known is required. Learned journals, research and conference reports, publications from universities and learned societies, and dissertations present the progress in research. It is important that all properties of compounds (stereochemistry, physical values, chemical and environmental behaviour, toxicity etc.) reported in these publications be indexed and made available to the users. There is also a need for factual and/or numerical data and reviews concerning general or specific topics. High on the list of desiderata are timeliness, accuracy and completeness of the information. Abstracting and indexing services and database producers have to take in consideration that a high degree of user-friendliness is necessary. In the future, most of the information will be offered in computer readable form (factual and numerical databases, reaction databases, information on CD-ROM etc.), a fact which will require many improvements in the flow of information in order to render possible an easy and direct access to the chemical information worldwide. (author). 15 refs.

17431 (IAEA-SM–317/76) **Databases in the documentation management for big industrial projects.** Cauchet, A. (Societe EURODOC, Saint Quentin en Yvenlines (France)); Chevillard, F.; Parisot, Y.; Tirefort, C. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 12p. (In French). (CONF-900550–: International symposium on the future of scientific, technological and industrial information services,

Leningrad (USSR), 28-31 May 1990). Order Number DE95628875. Source: OSTI; NTIS (US Sales Only); INIS.

The documentation management of a big industrial project involves a continuous update of information, both in the study and realization phase or in the operation phase. The organization of the technical documentation for big industrial projects requests complex information systems. In the first part of this paper are presented the methods appropriate for the analysis of documentation management procedures and in the second part are presented the tools by the combination of which a documentation system for the user is provided. The case of the documentation centres for the Hague reprocessing plant is described.

17432 (INDC(NDS)–320) **Establishment of an international reference data library of nuclear activation cross sections. Summary report of the first research co-ordination meeting held in Debrecen, Hungary, from 4 to 7 October 1994.** Pashchenko, A.B. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Feb 1995. 28p. (CONF-9410342–: 1. research co-ordination meeting on establishment of an international reference data library of nuclear activation cross sections, Debrecen (Hungary), 4-7 Oct 1994). Order Number DE95628879. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains the Summary of the First IAEA Research Co-ordination Meeting (RCM) of the new Co-ordinated Research Programme (CRP) on "Establishment of an International Reference Data Library of Nuclear Activation Cross Sections". The meeting was organized by the IAEA Nuclear Data Section with co-operation and assistance of local organizers from the Institute of Experimental Physics and held in Debrecen, Hungary, from 4 to 7 October 1994. The purpose of the RCM was to discuss the scope and goals of the CRP, to report and evaluate the first results of the research carried out by each participating laboratory, to review the current tasks, identify further actions of participants and agree on the coordination of work under this CRP. The detailed agenda, the list of participants, conclusions and recommendations of the meeting are presented in the summary report. (author).

17433 (INIS-mf–14504) **Nuclear data newsletter. No. 18.** International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section. Nov 1993. 13p. Order Number DE95628142. Source: OSTI; NTIS (US Sales Only); INIS.

This issue of the Nuclear Data Newsletter dated November 1993 gives information on the following topics: data indexes and bibliographies, new nuclear data libraries received including a package of three data libraries on photon-electron interaction, a list of selected new publications on nuclear data.

17434 (INIS-mf–14505) **Nuclear data newsletter. No. 19.** International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section. Sep 1994. 12p. Order Number DE95628143. Source: OSTI; NTIS (US Sales Only); INIS.

This issue of the Nuclear Data Newsletter dated September 1994 contains information on the following topics: WRENDA 93/94, online nuclear data service, data indexes and bibliographies, new nuclear data libraries received, a list of publications on nuclear data libraries grouped by type and field.

17435 (SAND–94-3125) **Summary report for the viability of asynchronous transfer mode (ATM) in local area network (LAN) environments Laboratory Directed Research and Development Project.** Gossage, S.A.; Naegle, J.H.; Testi, N.; Tarman, T.D. Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009664. Source: OSTI; NTIS; GPO Dep.

This report summarizes the activities of a Lab Directed Research and Development (LDRD) Project to investigate the viability of asynchronous transfer mode (ATM) switching technology in the local area network (LAN) environment. A number of ATM based LANs were constructed and their performance capabilities were measured. The summary report notes the measurements and lessons learned from the two-year effort.

17436 (SAND–95-0305C) **Risk-based assessment of the surety of information systems.** Jansma, R.; Fletcher, S.; Halbgewachs, R.; Lim, J.; Murphy, M.; Sands, P.; Wyss, G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503111–1: Toward an electronic patient record '95, Orlando, FL (United States), 14-19 Mar 1995). Order Number DE95008545. Source: OSTI; NTIS; GPO Dep.

Correct operation of an information system requires a balance of "surety" domains – access control (confidentiality), integrity, utility, availability, and safety. However, traditional approaches provide little help on how to systematically analyze and balance the combined impact of surety requirements on a system. The key to achieving information system surety is identifying, prioritizing, and mitigating the sources of risk that may lead to system failure. Consequently, the authors propose a risk assessment methodology that provides a framework to guide the analyst in identifying and prioritizing sources of risk and selecting mitigation techniques. The framework leads the analyst to develop a risk-based system model for balancing the surety requirements and quantifying the effectiveness and combined impact of the mitigation techniques. Such a model allows the information system designer to make informed trade-offs based on the most effective risk-reduction measures.

17437 (SAND–95-0661C) **Scalable ATM encryption.** Sandia National Labs., Albuquerque, NM (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503129–1: Cray User Group spring conference, Denver, CO (United States), 15 Mar 1995). Order Number DE95009868. Source: OSTI; NTIS; GPO Dep.

In order to provide needed security assurances for traffic carried in Asynchronous Transfer Mode (ATM) networks, methods of protecting the integrity and privacy of traffic must be employed. Cryptographic methods can be used to assure authenticity and privacy, but are hard to scale and the incorporation of these methods into computer networks can severely impact functionality, reliability, and performance. To study these trade-offs, a research prototype encryptor/decryptor is under development. This prototype is to demonstrate the viability of implementing certain encryption techniques in high speed networks by processing Asynchronous Transfer Mode (ATM) cells in a SONET OC-3 payload. This paper describes the objectives and design trade-offs intended to be investigated with the prototype. User requirements for high performance computing and communication have driven Sandia to do work in the areas of functionality, reliability, security, and performance of high speed communication networks. Adherence to standards (including emerging standards) achieves greater functionality of high speed computer networks by providing wide interoperability of applications, network hardware, and network software.

17438 (SAND–95-0665C) **A proposed Generic Authentication Information Element.** Tarman, T.D. Sandia National Labs., Albuquerque, NM (United States). 10 Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504139–2: ATM forum technical committee meeting, Denver, CO (United States), 10 Apr 1995). Order Number DE95009862. Source: OSTI; NTIS; GPO Dep.

This contribution describes a proposed information element that can convey authentication information within an ATM signaling message. The design of this information element provides a large amount of flexibility to the user because it does not specify a particular signature algorithm, and it does not specify which information elements must accompany the Authentication IE in a signaling message. This allows the user to implement authenicated signaling based on her site's security policies and performance requirements.

17439 (SAND–95-0666C) **Proposed DDS-specific fields for the Generic Authentication Information Element.** Tarman, T.D. Sandia National Labs., Albuquerque, NM (United States). 10 Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504139–1: ATM forum technical committee meeting, Denver, CO (United States), 10 Apr 1995). Order Number DE95009839. Source: OSTI; NTIS; GPO Dep.

This contribution proposes the format of the "Algorithm-Specific Information" and "Signature" fields within the "Proposed Generic Authentication Information Element" for authentication IEs based on the Digital Signature Standard (DSS). These fields are designed to allow various levels of authentication "strength" (or robustness), and many of these fields may be omitted in systems that optimize authentication performance by sharing common (public) Digital Signature Algorithm (DSA) parameters. This allows users and site security officers to design their authenicated signaling according to site security and performance requirements.

17440 (WHC-SD-GN-PMP–30012) **QUEST2: Project plan for preliminary analysis/system architecture phase (PA/SA).** Braaten, F.D. Westinghouse Hanford Co., Richland, WA (United States). 8 Mar 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008835. Source: OSTI; NTIS; INIS; GPO Dep.

This Project Management Plan combines the project management deliverables from the P+ methodology that are applicable to this part of the QUEST2 work. This consolidation reflects discussions with WHC QA regarding an appropriate method for ensuring that P+ deliverables fulfill the intent of WHC-CM-3-10 and QR-19.

17441 (WHC-SD-WM-CSUD–010) **Computer software user document for Employee Position Requirements Tracking System (EMPORTS).** Davidson, S.M. Westinghouse Hanford Co., Richland, WA (United States). 13 Feb 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008049. Source: OSTI; NTIS; GPO Dep.

The Engineering and Projects Departments of ICF Kaiser have requested the development of a data base system to track training certification records of employees assigned to their respective divisions. The requested system is to provide division administrative staff with a flexible tool to track the status of employee completion of assigned project training and reading assignments based on established division/project discipline prerequisites. This user document provides instructions for EMPORTS program execution (log in and log off), entry and revision of data, generation of user reports, and modification of user access.

17442 (IAEA–12-SP-384.37, pp. 58-85) **IAEA activity on operator support systems in nuclear power plants.** Dounaev, V. (Consyst Co., Ltd., Moscow (Russian Federation)); Fujita, Y.; Juslin, K.; Haugset, K.; Kossilov, A.; Lux, I. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Various operator support systems for nuclear power plants are already operational or under development in the IAEA Member States. Operator support systems are based on intelligent data processing and, in addition to plant operation, they are also becoming more important for safety. A key feature of operator support systems is their availability to restructure data to increase its relevance for a given situation. This can improve the user's ability to identify plant mode, system state, and component state and to identify and diagnose faults. Operator support systems can also assist the user in planning and implementing corrective actions to improve the nuclear power plant's availability and safety. In September 1991, the IAEA Committee for Contractual Scientific Services approved the Co-ordinated Research Programme (CRP) on "Operator Support Systems in Nuclear Power Plants" in the framework of the Project "Man-Machine Interface Studies". The main objective of this programme is to provide guidance and technology transfer for the development and implementation of operator support systems. This includes the experience with human-machine interfaces and closely related issues such as instrumentation and control, the use of computers in nuclear power plants, and operator qualification. (author).

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3 (Rev.1), *International Energy: Research Organizations 1988–1992*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

Injection and laser acceleration of ions based on the resonant surface photoionization, 20:16381 (R;RU;In Russian)

ARCTECH, Inc., Chantilly, VA (United States)
Development of biological coal gasification (MicGAS process). 18th Quarterly report, 20:14721 (R;US)

Argonne National Lab., Idaho Falls, ID (United States)
A reconfigurable hybrid supervisory system for process control, 20:15481 (R;US)
Pyrophoricity of uranium in long-term storage environments, 20:14917 (R;US)
Simplified risk assessment for transporting ATR spent fuel within the INEL, 20:14916 (R;US)
System modeling of spent fuel transfers at EBR-II, 20:15452 (R;US)

Argonne National Lab., IL (United States)
Accelerating RCRA corrective action: The principles of the DOE approach, 20:15645 (R;US)
Accident analysis for transuranic waste management alternatives in the U.S. Department of Energy waste management program, 20:15161 (R;US)
Alternative catalyst and exhaust gas sensor work at Argonne National Laboratory, 20:15810 (R;US)
An overview of the corrective action management unit and temporary unit regulations, 20:15165 (R;US)
Analysis of boron dilution in a four-loop PWR, 20:15406 (R;US)
Analysis of the potential for new automotive uses of magnesium, 20:15809 (R;US)
APSTNG: Associated particle sealed-tube neutron generator studies for arms control. Final report on NN-20 Project ST220, 20:15814 (R;US)
Argonne-West facility requirements for a radioactive waste treatment demonstration, 20:14955 (R;US)
Assessment of transportation risk for the U.S. Department of Energy Environmental Management programmatic environmental impact statement, 20:14951 (R;US)
Behavior of spent fuel under unsaturated conditions, 20:14949 (R;US)
Case study: Evaluation of a scenario for the reuse of structures in the production area at Fernald, 20:15163 (R;US)
Coal use in the People's Republic of China, Volume 2: The economic effects of constraining coal utilization, 20:14770 (R;US)
Competition between SMES and flywheels, 20:15629 (R;US)
Conversion of holes into reducing species on surface modified small-particle TiO_2, 20:15775 (R;US)
Criticality control during conditioning of spent nuclear fuel in the Fuel Cycle Facility, 20:16256 (R;US)

Derivation of residual radioactive material guidelines for uranium in soil at the Middlesex Sampling Plant Site, Middlesex, New Jersey, 20:15166 (R;US)
Development of aluminum nitride insulator coatings for fusion reactor applications, 20:17195 (R;US)
Development of chemical profiles for U.S. Department of Energy low-level mixed wastes, 20:14952 (R;US)
Development of radiological profiles for U.S. Department of Energy low-level mixed wastes, 20:14953 (R;US)
Environmentally assisted cracking in light water reactors. Semiannual report, October 1993–March 1994. Volume 18, 20:15384 (R;US)
Factors affecting minority population proximity to hazardous facilities, 20:15636 (R;US)
Faster, cheaper radioanalytical methods, 20:16123 (R;US)
Field assessment of an aluminum intensive passenger car, 20:15808 (R;US)
First assessment of computations of turbulent bubbly flow and particulate flow with the COMMIX-M program, 20:16287 (R;US)
First-principles calculations of surface energy and electronic structure of LiF, NaCl and MgO (100) surfaces, 20:16053 (R;US)
Geophysical exploration in the Lautertal at the Combat Maneuver Training Center, Hohenfels, Germany, 20:16518 (R;US)
Influence of fiber content on mechanical performance of SiC-fiber-reinforced reaction-bonded silicon nitride composites, 20:16052 (R;US)
Interim progress report addendun - environmental geophysics: Building E5032 decommissioning, Aberdeen Proving Ground, January 1994 resurvey, 20:16454 (R;US)
Issues related to uncertainty in projections of hazardous and mixed waste volumes in the U.S. Department of Energy's environmental restoration program, 20:15162 (R;US)
Lessons learned in acquiring new regulations for shipping advanced electric vehicle batteries, 20:15631 (R;US)
New Technology for America's Electric Power Industry. Emissions reduction in gas turbines, 20:14908 (R;US)
NMR imaging and hydrodynamic analysis of neutrally buoyant non-Newtonian slurry flows, 20:16962 (R;US)
On the possibility of a two-state magnetic structure for nanocrystalline chromium, 20:15816 (R;US)
Performance evaluation of high-temperature superconducting current leads for micro-SMES systems, 20:17024 (R;US)
Producing usable fuel from municipal solid waste, 20:15240 (R;US)
Progress on integrating environmental restoration data into mixed waste updates, 20:15164 (R;US)
Pyroprocessing oxide spent nuclear fuels for efficient disposal, 20:14950 (R;US)
Radiological accidents potentially important to human health risk in the U.S. Department of Energy waste management program, 20:15160 (R;US)
Removal of actinide elements from liquid scintillation cocktail wastes using liquid-liquid extraction and demulsification techniques, 20:14948 (R;US)
Status report on the Experimental Boiling Water Reactor (EBWR) Decontamination and Decommissioning (D&D) Project, 20:15595 (R;US)
Summary report for ITER Task - T226B: Evaluation of ITER disruption erosion, 20:17196 (R;US)
The modeling of contaminant flow during proposed treatment of U.S. Department of Energy low-level radioactive mixed wastes, 20:14954 (R;US)
Training implications of skills needed for environmental cleanup, 20:15635 (R;US)

Arizona State Univ., Tempe, AZ (United States). Dept. of Chemistry and Biochemistry
Photoinitiated electron transfer in multichromophoric species: Synthetic tetrads and pentads, 20:15288 (R;US)

Arizona Univ., Tucson, AZ (United States)
Role of pectolytic enzymes in the programmed separation of cells from the root cap of higher plants. Final report, 20:16601 (R;US)

Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering
Interactions between trace metals, sodium and sorbents in combustion. Quarterly report No. 1, October 1, 1994–December 31, 1994, 20:14789 (R;US)

Arizona Univ., Tucson, AZ (United States). Dept. of Geosciences
Electrochemical determination of the Gibbs free energies of rock-forming minerals. Final report, 20:15331 (R;US)

Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)
Benchmark experiment on stainless steel bulk shielding at Frascati neutron generator, 20:16925 (R;IT)
Consistent determination of pressure/toroidal magnetic field profiles in Grad-Shafranov's equation, 20:17152 (R;IT)
Effect of argon injection on high Z impurity generation from poloidal inconel limiter in FTU, 20:17240 (R;IT)
Electromagnetic forces on ITER first wall and blanket, 20:17151 (R;IT)
Electron-beam welding of grill flanges of FTU additional heating system, 20:17239 (R;IT)
Exact and appoximate geometric calculations for toroidal D-shaped plasmas: Application to Ignitor-Ult, 20:17154 (R;IT)
Experimental plasma equilibrium reconstruction from kinetic and magnetic measurements in FTU Tokamak, 20:17153 (R;IT)
Formation and evolution of wall protective plasma shield in hard disruption, 20:17150 (R;IT)
FTU collective scattering diagnostics: Scattering geometries, expected performances, antenna decoupling and detection requirements, 20:17238 (R;IT)
Proposal for two colour interferometer for FTU, 20:17161 (R;IT)
Self-consistent analysis of impurity dynamics on FTU-Tokamak, 20:17163 (R;IT)

Auburn Univ., AL (United States)
Low severity coal liquefaction promoted by cyclic olefins. Quarterly report, October 1994–December 1994, 20:14731 (R;US)
Role of the resid solvent in catalytic coprocessing. Quarterly report, October 1994–December 1994, 20:14730 (R;US)

B

Battelle, Columbus, OH (United States)
Assessment of short through-wall circumferential cracks in pipes. Experiments and analysis: March 1990–December 1994, 20:15606 (R;US)
Refinement and evaluation of crack-opening-area analyses for circumferential through-wall cracks in pipes, 20:15607 (R;US)

Bechtel Hanford, Inc., Richland, WA (United States)
100-BC-5 operable unit focused feasibility study report. Draft A, 20:15144 (R;US)

Bechtel National, Inc., Richland, WA (United States)
100-BC-2 limited field investigation report, 20:14977 (R;US)
Hanford Site waste management units report. Revision 4, Volume 1, 20:14974 (R;US)
Hanford Site waste management units report: Sample and data management. Revision 4, Volume 2, 20:14975 (R;US)
Limited field investigation report for the 100-BC-2 Operable Unit, 20:15173 (R;US)
Limited field investigation report for the 100-HR-2 Operable Unit, 20:15174 (R;US)
Proposed plan for the Environmental Restoration Disposal Facility (ERDF) at the Hanford Site, Richland, Washington. Revision 1, 20:14978 (R;US)
Risk evaluation of remedial alternatives for the Hanford Site, 20:15172 (R;US)

Bettis Atomic Power Lab., West Mifflin, PA (United States)
Homogeneous critical Monte Carlo eigenvalue calculations with revised ENDF/B-VI data sets, 20:16924 (R;US)
Laboratory robotics – An automated tool for preparing ion chromatography calibration standards, 20:16178 (R;US)

Bhabha Atomic Research Centre, Bombay (India)
"HFLOWR" - a computer code for predicting flow regimes in a horizontal channel with rod cluster, 20:15451 (R;IN)
An ICP-AES method for the determination of trace metals in uranium by solvent extraction using KSM-17, 20:16125 (R;IN)

An improved scheme for the evaluation of λ-modes of a multi-group neutron diffusion equation, 20:15459 (R;IN)
Automatic processing of gamma ray spectra employing classical and modified Fourier transform approach, 20:16392 (R;IN)
Composition and leachability of trace elements in coal ash and their migration in ground water at thermal power plant site at Manuguru, 20:14764 (R;IN)
Dicyclohexano-18-crown-6 as a novel carrier in the liquid membrane permeation of actinides, 20:16207 (R;IN)
Elasto-plastic finite element analysis of axial surface crack in PHT piping of 500 MWe PHWR, 20:15450 (R;IN)
Experimental and analytical studies of leak-before-break on circumferentially through-wall cracked pipes under bending load : Part-1 (September 1993 - June 1994), 20:15462 (R;IN)
Generation of data base for on-line fatigue life monitoring of Indian nuclear power plant components: Part I - Generation of Green's functions for end fitting, 20:15449 (R;IN)
Ion-bombardment etching of nuclear materials, 20:15904 (R;IN)
Laser and Plasma Technology Division annual report 1993, 20:17145 (R;IN)
Partitioning of actinide from simulated high level wastes arising from reprocessing of PHWR fuels: counter current extraction studies using CMPO, 20:14956 (R;IN)
Physical, anatomical, physiological and metabolic data for reference Indian man - a proposal, 20:16620 (R;IN)
Preparation of carbonaceous electrodes and evaluation of their performance by electrochemical techniques, 20:16124 (R;IN)
Studies on the diffusional and electrical transport of the daughter aerosols of radon and thoron in moving gases, 20:16481 (R;IN)

Bonn Univ. (Germany)

Studies on the uptake and incorporation of anthropogenic nitrogen oxides (NO_x) by sunflowers and maize by using ^{15}N isotope tracers, 20:16709 (R;DE;In German)

Brookhaven National Lab., Upton, NY (United States)

^{3}He RFQ for PET isotope production: A UW/SAIC progress report, 20:16338 (RA;US)
A new radioisotope - production research facility utilizing ion beams from AVF cyclotron, 20:16233 (RA;US)
A new versatile target design, 20:16365 (RA;US)
A novel solid graphite target for the production of ^{13}N-ammonia, 20:16213 (RA;US)
A simple liquid detector for radiopharmaceutical processing systems, 20:16223 (RA;US)
A target chamber for the routine production of $[^{18}F]$-F_2, 20:16368 (RA;US)
Advances in the robotic production of radiopharmaceuticals, 20:16229 (RA;US)
An efficient system for the preparation of $[^{11}C]$-HCN, CO_2 and CO, 20:16226 (RA;US)
An experimental carbon/steam stack target for in-situ production of $[^{13}N]$ammonia with low energy deuterons, 20:16218 (RA;US)
An investigation of aluminum alloy 6061 heat treatment and its effect on iodine absorption in Nordion gas targets, 20:16210 (RA;US)
An ultra-compact ^{13}N-ammonia generator, 20:16339 (RA;US)
Application of an industrial robot to nuclear pharmacy, 20:16607 (RA;US)
Application of biochemical interactions in fossil fuels, 20:14713 (R;US)
Applications of chiral symmetry, 20:16782 (R;US)
Biochemical processing of geothermal brines and sludges, 20:15332 (R;US)
Control of radioactive material pneumatic transport system using an inexpensive programmable logic controller, 20:16369 (RA;US)
Cylindrical shell buckling through strain hardening, 20:16257 (R;US)
Detectors and transducers for target operation and automated P.E.T. chemistry, 20:16222 (RA;US)
Determination of excitation functions for $^{20}Ne(p,p2n)^{18}Ne \rightarrow {}^{18}F$ and $^{20Ne}(p,2n)^{18}F$ and a reexamination of production of $[^{18}F]F_2$ with protons on neon, 20:16872 (RA;US)
Effects of temperature ramp rate during heat treatment on hysteresis loss and critical current density of internal tin processed wires, 20:17025 (R;US)
Environmental and health aspects of copper-indium-diselenide thin-film photovoltaic modules, 20:15286 (R;US)
Establishment of an European Astatine Collaboration, 20:16237 (RA;US)
Excitation function for ^{178}W production in the $^{181}Ta(p,4n)^{178}W$ reaction over proton energy range 28.8-71.8 MeV, 20:16871 (RA;US)
Experience with the IBA automated chemistry systems, 20:16230 (RA;US)
Experience with the NIH ethanol water target, 20:16197 (RA;US)
Experiences with a new high pressure water target for the production of $[^{13}N]$ ammonia, 20:16215 (RA;US)
FDG production and quality control at North Carolina Baptist Hospital Bowman Gray School of Medicine P.E.T. Center, 20:16372 (RA;US)

Environmental policy in (former) centrally planned economics. A Polish perspective, 20:15639 (RA;DK)
Pollution taxes and international competitiveness, 20:15662 (RA;DK)
Public participation in water management planning, 20:15660 (RA;DK)
Sustainable development as a planning goal for energy systems in the Nordic and Baltic area, 20:15633 (RA;DK)
The economic incentive of pollution control charges. Exceptions to the 'rule', 20:15640 (RA;DK)

CQ, Inc., Homer City, PA (United States)
Development of a coal quality expert. Technical progress report No. 17, April 1994–June 1994, 20:14707 (R;US)

D

Danmarks Geologiske Undersoegelske, Copenhagen (Denmark)
A Mid-Miocene progradational, sandy barrier island and backbarrier section, central Jylland, Denmark, 20:14807 (R;DK)
Cenozoic sequence stratigraphy in the eastern North Sea, 20:16715 (R;DK)
Contribution to the meeting 'Stratigraphy of the Paleocene', 20:16725 (R;DK)
Correlation of Miocene North Sea sequences with the Danish land area based on foraminifera, 20:16730 (R;DK)
Detailed foraminiferal biostratigraphy of the Danish marine Miocene formations, 20:16731 (R;DK)
Ecocene and Oligocene calcareous nannofossil biostratigraphy in the Linde-1 and Borg-1 boreholes, 20:16728 (R;DK)
Foraminiferal biostratigraphy of Cenozoic sections in five wells from the Danish area, 20:16729 (R;DK)
Foraminiferal biostratigraphy of the post mid-Miocene in two boreholes in the Danish North Sea, 20:16734 (R;DK)
Foraminiferal biostratigraphy of the post mid-Miocene in the Danish Central Trough, North Sea, 20:16735 (R;DK)
Introduction to the project and a summary of the results, 20:14803 (R;DK;In Danish)
Late Cenozoic sequences in the Southern North Sea Basin, 20:14805 (R;DK)
Linde-1 borehole: Paleogene dinocysts, palynofacies and stratigraphy, 20:16727 (R;DK)
Low-sinuosity river deposits from the Middle Miocene quarts sands of Jylland, 20:16724 (R;DK)
Neogene and Quaternary dinoflagellate cyst biostratigraphy and paleoclimatology of the Karl-1 borehole, Central Trough in the Danish North Sea area, 20:16732 (R;DK)
Neogene and Quaternary dinoflagellate cyst, foraminiferal, and molluscan biostratigraphy and paleoclimatology and paleoenvironment of the Lille Toende borehole, southern Jylland, Denmark, 20:16733 (R;DK)
Numerical biostratigraphy and depositional environments: benthic microfaunas in the Tertiary (Neogene) clastic sequence, Danish North Sea, 20:16736 (R;DK)
Occurrence of major sequence stratigraphic boundaries in relation to basin development in Cenozoic deposits of the southeastern North Sea, 20:16716 (R;DK)
Oligocene sequence stratigraphy and basin development in the Danish North Sea sector based on log interpretation, 20:16720 (R;DK)
Palaeocene/Eocene diatomite in wells in the eastern North Sea, 20:14806 (R;DK)
Paleogene radiolaria and diatoms from three exploration wells from the Central Graben, North Sea (Danish Sector): stratigraphic and palaeoenvironmental significance, 20:16726 (R;DK)
Seismic sequence stratigraphy of the Tertiary in the Danish North Sea. Incl. 7 structural maps of the main sequences, and 35 isochore maps of main sequences and smaller units, 20:16718 (R;DK)
Seismic stratigraphy and foraminiferal biofacies in a profile into the Central Trough, North Sea, 20:14804 (R;DK)
Sequence and systems tract interpretation of the epicontinental Oligocene deposists in the Danish North Sea sector, 20:16719 (R;DK)
Stratigraphic correlation of the Danish onshore and offshore Tertiary successions based on sequence stratigraphy, 20:16717 (R;DK)
Stratigraphical correlation of late Paleocene sand deposits in the Soegne Basin and adjacent areas, Central North Sea, 20:16721 (R;DK)
Tertiary fluvial deposits of Jylland, Addit area, 20:16723 (R;DK)
Transitional Palaeocene-Eocene ash bearing diatomite in the eastern North Sea, 20:16722 (R;DK)

Danmarks Miljoeundersoegelser, Roskilde (Denmark)
Atmospheric deposition of nitrogen. The Nation-Wide Danish Monitoring Programme 1993, 20:16586 (R;DK;In Danish)

Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms, 20:15482 (R;XA)
Prototype of an expert system based nuclear power plant information systems, 20:15497 (RA;XA)
SACRI: A measure of situation awareness for use in the evaluation of nuclear power plant control room systems providing information about the current process state, 20:15498 (RA;XA)
The development of functional requirement for integrated test facility, 20:15496 (RA;XA)
The proposed human factors engineering program plan for man-machine interface system design of the next generation NPP in Korea, 20:15490 (RA;XA)
The role of the artificial intelligence within the context of the human factors in the nuclear safety, 20:15505 (RA;XA)
Verification and validation of software related to nuclear power plant control and instrumentation, 20:15501 (RA;XA)

Institutul Politehnic, Bucharest (Romania)
Enhancement of heliothermal systems efficiency, 20:15284 (I;BG)

International Atomic Energy Agency, Vienna (Austria)
A case study in information needs of ISTIC users, 20:17421 (I;XA)
An approach to evaluate task allocation between operators and automation with respect to safety of Nuclear Power Plants, 20:15493 (RA;XA)
Analytical information for management of a scientific research institute, 20:17425 (I;XA)
APACS: Monitoring and diagnosis of complex processes, 20:15483 (RA;XA)
Application of isotope and geochemical techniques to geothermal exploration in Southeast China - A review, 20:15317 (RA;XA)
Applications of autoassociative neural networks for signal validation in accident management, 20:15504 (RA;XA)
Applications of stable isotopes in geothermal exploration in the Philippines - A review, 20:15323 (RA;XA)
Appropriate information systems in underdeveloped countries: The case of the Sudan, 20:17299 (I;XA)
Biotechnology information service of the GDR, 20:17303 (I;XA)
Ceramic coatings for HTR graphitic structures, 20:15446 (RA;XA)
Chemical and isotopic studies of fluids in the Bacon-Manito geothermal field, Philippines, 20:15325 (RA;XA)
China's HTR test module project, 20:15428 (RA;XA)
Computer managed emergency operating procedures, 20:15494 (RA;XA)
Computerized integrated data base production system (COMPINDAS), 20:17296 (I;XA)
Concept of automated system development for production and processing of scientific and technical data texts, 20:17422 (I;XA;In Russian)
Contribution of qualitative analysis and fuzzy sets to industrial process fault diagnosis: Application to the DIAPASON project, 20:15500 (RA;XA)
Conversion and distribution of bibliographic information for further use on microcomputers with database software such as CDS/ISIS, 20:17415 (I;XA)
Databases in the documentation management for big industrial projects, 20:17431 (I;XA;In French)
Development prospects of automated data service in the USSR, 20:17423 (I;XA;In Russian)
Diagnostic knowledge generation of nuclear power plants using knowledge compilers, 20:15503 (RA;XA)
Enabling technologies and methods for the retro-fitting of AI software into NPPS, 20:15502 (RA;XA)
Environmental isotope-aided studies on geothermal water in the republic of Korea, 20:16540 (RA;XA)
European Community initiatives and experience in scientific and technical information, 20:17294 (I;XA)
Evaluating on graphite oxidation during an air ingress accident in HTTR, 20:15438 (RA;XA)
Evaluation of graphite oxidation during water ingress accidents in HTTR, 20:15442 (RA;XA)
Evaluation of human fitness for duty in a real working situation, 20:15506 (RA;XA)
Evaluation of networking and telecommunication; some experiences gained, 20:17302 (I;XA)
Evolution of scientific and technological documentation services at ENEA, 20:17414 (I;XA)
Experience from development and operation of the core surveillance systems SCORPIO, 20:15488 (RA;XA)
Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993, 20:14921 (R;XA)
Experience with the upgraded VERONA-u WWER-440 core monitoring system, 20:15487 (RA;XA)
Experience with underwater storage of spent fuel from research reactors in India, 20:14929 (RA;XA)
Experimental investigations of reactivity effects caused by water ingress in a LEU-LHTR pebble-bed core, 20:15433 (RA;XA)

Experimental results of air ingress in heated graphite channels: A summary of American analyses of the Windscale and Chernobyl accidents, 20:15434 (RA;XA)
Experimental study on structural integrity of oxidized support post for HTTR, 20:15430 (RA;XA)
Expert system aided operator's mental activities training, 20:15491 (RA;XA)
Expert system for quality control in the INIS database, 20:17429 (I;XA)
French gas cooled reactor experience with moisture ingress, 20:15431 (RA;XA)
Fuel irradiation experiments on HFR-K6 and HFR-B1 with intermittent water vapour injections, 20:15429 (RA;XA)
Fuel storage handling at the R2 reactor at Studsvik, 20:14932 (RA;XA)
Geochemical and isotope studies of the geothermal areas of central and Northern India, 20:15319 (RA;XA)
Geochemical and isotopic investigation of Biliran geothermal discharges, Philippines, 20:15324 (RA;XA)
Guidelines for comparative assessment of the environmental impacts of wastes from electricity generation systems. A framework for the assessment and comparison of environmental impacts, 20:14766 (R;XA)
Guidelines for the presentation of emergency operating procedures using advanced information technology, 20:15489 (RA;XA)
Handling, treatment, conditioning and storage of biological radioactive wastes. Technical manual for the management of low and intermediate level wastes generated at small nuclear research centres and by radioisotope users in medicine, research and industry, 20:14990 (R;XA)
Human factor in development and implementation of a computerized operator support system (COSS) at an operating power unit of the Novovoronezh NPP, 20:15492 (RA;XA)
Hyperdatabase: A schema for browsing multiple databases, 20:17301 (I;XA)
IAEA activity on operator support systems in nuclear power plants, 20:17442 (RA;XA)
Improving CANDU annunciation - Current R and D and future directions, 20:15495 (RA;XA)
Industrial and technological information. Who has it and who needs it? The role of NTIS in acquisition and dissemination, 20:17297 (I;XA)
Information needs of engineers. The methodology developed by the WFEO Committee on Engineering Information and the use of value analysis for improving information services, 20:17419 (I;XA)
Information retrieval and services with the help of the ASPID–5/ES and ASPID-7/SM software for mainframe or mini-computer, 20:17420 (I;XA;In Russian)
Information support for solving research and development problems, 20:17304 (I;XA)
Information technology and software of automated library information network of USSR scientific and technical libraries, 20:17424 (I;XA;In Russian)
Integration of library and information activities: The INIST challenge, 20:17307 (I;XA)
Interaction between national and international information systems: The case of AGRIS and CARIS, 20:17428 (I;XA)
Investigation of air ingress accidents under depressurization of the VGM modular reactor primary circuit, 20:15436 (RA;XA)
ISACS-1, a limited prototype of an advanced control room, 20:15484 (RA;XA)
Isotope and geochemical survey of geothermal systems of Yozgat province in Central Anatolia, Turkey, 20:15327 (RA;XA)
Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993, 20:15316 (R;XA)
Isotope study in geothermal fields in Java Island, 20:15320 (RA;XA)
Isotopic and chemical composition of waters and gases from the east coast accretionary prism, New Zealand, 20:15326 (RA;XA)
Isotopic and chemical studies of geothermal waters of Northern Areas in Pakistan, 20:15322 (RA;XA)

ITER EDA Newsletter. V.4, no.1, 20:17254 (I;XA)
Multilingual access to full text databases, 20:17293 (I;XA;In French)
Multilingual indexing and retrieval in bibliographic retrieval systems: The AGRIS experience, 20:17427 (I;XA)
National scholarly information system in Japan. Extended synopsis, 20:17300 (I;XA)
Needs, demands and motivation in the use of sources of information, 20:17306 (I;XA)
New generation main control room of enhanced safety NPP with MKER reactor, 20:15499 (RA;XA)
Occurrences in control room equipment, procedures and personnel performances: IRS control room events, 20:15485 (RA;XA)
Opening statement by the scientific secretary, 20:17413 (I;XA)
Optimization of advanced plants operation: The Escrime project, 20:15486 (RA;XA)
PC version of PRIS (Power Reactor Information System), 20:15379 (I;XA)
PCARRD's strategies for technology transfer: The agriculture and resources regional technology information system and the regional applied communication program, 20:17292 (I;XA)
Preliminary geochemical and isotopic study of the South Trungbo geothermal area in Central Viet Nam, 20:15328 (RA;XA)
Preparation of safety analysis reports (SARs) for near surface radioactive waste disposal facilities. Format and content of SARs, 20:14992 (R;XA)
Present status of spent fuels in Japanese research reactors, 20:14930 (RA;XA)
Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms, 20:15482 (R;XA)
Processes controlling the chemical composition of natural waters in the Hreppar-Land in Southern Iceland, 20:16539 (RA;XA)
Processes influencing $\delta\ ^{2}H$, $\delta\ ^{18}O$, and Cl distribution in cold and thermal waters in the NW-Peninsula and in the Southern Lowlands, Iceland, 20:15318 (RA;XA)
Prototype of an expert system based nuclear power plant information systems, 20:15497 (RA;XA)
Reference design for a centralized waste processing and storage facility. Technical manual for the management of low and intermediate level wastes generated at small nuclear research centres and by radioisotope users in medicine, research and industry, 20:14991 (R;XA)
Resolutions and other decisions of the General Conference. Thirty-seventh regular session. 27 September - 1 October 1993, 20:17289 (R;XA)
Response of fuel, fuel elements and gas cooled reactor cores under accidental air or water ingress conditions. Proceedings of a technical committee meeting held in Beijing, China, 25-27 October 1993, 20:15427 (R;XA)
SACRI: A measure of situation awareness for use in the evaluation of nuclear power plant control room systems providing information about the current process state, 20:15498 (RA;XA)
Scenarios of hypothetical water and air ingress in small modular HTGRs, 20:15439 (RA;XA)
Simulation of steam ingress accidents with irradiated fuel elements, 20:15432 (RA;XA)
Spectroscopic databases - A tool for structure elucidation, 20:17418 (I;XA)
Spent fuel storage at the ASTRA reactor, Seibersdorf, 20:14922 (RA;XA)
Spent fuel storage experience at the ET-RR-1 reactor in Egypt, 20:14925 (RA;XA)
Status of the back end of the fuel cycle for research reactors in Germany, 20:14927 (RA;XA)
Storage experience in Hungary with fuel from research reactors, 20:14928 (RA;XA)
Storage experience with fuel from research reactors in Belgium, 20:14923 (RA;XA)
Storage experience with fuel from research reactors in Denmark, 20:14924 (RA;XA)
Storage experience with fuel from research reactors in France, 20:14926 (RA;XA)

Strategic information for industrial policy-making in developing countries, 20:17308 (I;XA;In French)
Structure and representation of data elements on factual database - SIST activity in Japan, 20:17298 (I;XA)
Study of reaction: Coated SiC coatingon HTGR fuel elements, 20:15443 (RA;XA)
Study of the method to improve the corrosion resistance of the matrix materials of spherical fuel elements in HTGR, 20:15445 (RA;XA)
The development of functional requirement for integrated test facility, 20:15496 (RA;XA)
The future of scientific, technical and industrial information to Third World users - A donors view. The experience of the International Development Research Centre (IDRC), Canada, 20:17305 (I;XA)
The NACOK experiment on natural convection of air through the core, 20:15435 (RA;XA)
The online age and the agricultural user education, 20:17295 (I;XA)
The problems of treatment of irradiated fuel at Russian research reactors, 20:14931 (RA;XA)
The proposed human factors engineering program plan for man-machine interface system design of the next generation NPP in Korea, 20:15490 (RA;XA)
The role of the artificial intelligence within the context of the human factors in the nuclear safety, 20:15505 (RA;XA)
The roles of water addition and gas composition in AGR accident management, 20:15444 (RA;XA)
The state and development perspectives for an integrated information delivery system in the field of nuclear science and technology in the USSR, 20:17426 (I;XA;In Russian)
The use of CD-ROMs for storage and document delivery at the British Library Document Supply Centre, 20:17417 (I;XA)
The use of gas chemistry and isotope geothermometry to study the effects of exploitation and reinjection on the fluids at Larderello, Italy, 20:15321 (RA;XA)
Thermodynamic analysis of behaviour of HTGR fuel and fission products under accidental air or water ingress conditions, 20:15440 (RA;XA)
Toward common working tools: Arab League Documentation and Information Centre experience, 20:17416 (I;XA)
Transient analysis of air ingress from broken pipe into the HTR-10 reactor pressure vessel, 20:15437 (RA;XA)
Transient analysis of water ingress into the HTR-10 high temperature gas cooled test reactor, 20:15441 (RA;XA)
Transport safety research abstracts. No. 2. Information on research recently concluded and in progress, 20:14933 (R;XA)
User needs in chemical information, 20:17430 (I;XA)
Verification and validation of software related to nuclear power plant control and instrumentation, 20:15501 (RA;XA)

International Atomic Energy Agency, Vienna (Austria). Atomic and Molecular Data Unit

International bulletin on atomic and molecular data for fusion. No. 48, 20:16942 (I;XA)

International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee

A survey of selected neutron-activation reactions with short-lived products of importance to fusion reactor technology, 20:16887 (R;XA)
Comparison of activation cross section measurements and experimental techniques for fusion reactor technology. Summary report of the IAEA specialists' meeting held in St. Petersburg, Russia, 7 to 9 September 1994, 20:17246 (R;XA)
Establishment of an international reference data library of nuclear activation cross sections. Summary report of the first research co-ordination meeting held in Debrecen, Hungary, from 4 to 7 October 1994, 20:17432 (R;XA)
FENDL activation benchmark: Specifications for the calculational activation benchmark, 20:17245 (R;XA)
FENDL neutronics benchmark: Specifications for the calculational neutronics and shielding benchmark, 20:17244 (R;XA)
Improvement of measurements, theoretical computations and evaluations of neutron induced helium production cross sections. Summary report of the second research co-ordination meeting held in Beijing, China, from 1 to 4 November 1994, 20:16886 (R;XA)
Properties of standard-I mass channel in fission of Z-ODD nuclei, 20:16885 (R;XA)

International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation

1994 report on Task 4.3.1 investigate how training should be planned to ensure efficient utilisation or OSS. Task 4.3.2 evaluate how the introduction of OSS influences requirements to the basic education of the operator, 20:15558 (RA;XA)
1994 report on Tasks 4.3.1 and 4.3.2: Survey of anticipated requirements and qualification requirements for OSS, 20:15566 (RA;XA)
A method for analysis of nuclear power plant operators' decision making in simulated disturbance situations, 20:15559 (RA;XA)
A methodology for determining the optimal procedure basis for nuclear power plant operation, 20:15543 (RA;XA)
Activities in the field of nuclear reactor instrumentation and control in Poland - 1991 status, 20:15519 (RA;XA)
Brief summary of incident reporting system events with procedural deficiencies, 20:15530 (RA;XA)
Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994, 20:15548 (R;XA)
Computerized system for procedures execution monitoring, 20:15541 (RA;XA)
Contribution to the Task 4.3.1 investigate how training should be planned to ensure efficient utilization of OSS. Task 4.3.2 evaluate how the introduction of OSS influences requirements to the basic education of the operator, 20:15567 (RA;XA)
Design of operator support systems for Argentine Nuclear Power Plants, 20:15556 (RA;XA)
Determine what requirements should be established for verification and validation of OSS software, and which techniques are available to improve V and V. Task 4.5.3, 20:15555 (RA;XA)
Develop guidance on how the end user should be involved in the development of OSS. Reflection on Task 4.3.3, 20:15565 (RA;XA)
Development of monitoring, control and protection systems of nuclear power reactors in the USSR: Status and trends, 20:15524 (RA;XA)
Embalse NGS: Abnormal event procedures development lifecycle, 20:15532 (RA;XA)
Experience with the upgraded VERONA-u. A WWER-440 core monitoring system, 20:15564 (RA;XA)
Fault tree and failure mode and effects analysis of a digital safety function, 20:15562 (RA;XA)
Formal methods in design and verification of functional specifications, 20:15560 (RA;XA)
General overview of recent developments and future prospects for instrumentation and control activities in France, 20:15526 (RA;XA)
Highlights on nuclear power plant instrumentation and control activities in Belgium, 20:15511 (RA;XA)
IAEA CRP on operator support systems in nuclear power plants. 1994 national activities and task report (Task 4.2.2), 20:15568 (RA;XA)
Instrumentation and control activities at the Electric Power Research Institute to support operator support systems, 20:15554 (RA;XA)
Instrumentation and control in the Canadian nuclear power program - 1991 status, 20:15512 (RA;XA)
National report by Netherlands Energy Research Foundation (ECN), 20:15569 (RA;XA)
National report from Czech Republic, 20:15557 (RA;XA)
National report from Norway, 20:15551 (RA;XA)
National report from Romania, 20:15552 (RA;XA)
National report Netherlands KEMA, 20:15549 (RA;XA)
National report on nuclear power plant control and instrumentation in the United Kingdom, 20:15523 (RA;XA)
Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991, 20:15507 (R;XA)
Nuclear power plant control and instrumentation activities in Argentina during 1989-1991, 20:15509 (RA;XA)
Nuclear power plant control and instrumentation activities in Finland, 20:15514 (RA;XA)

Nuclear power plant control and instrumentation in Italy, 20:15516 (RA;XA)
Nuclear power plant control and instrumentation in the Netherlands: Status and developments, 20:15518 (RA;XA)
Nuclear power plant control and instrumentation activities in Spain, 20:15520 (RA;XA)
Nuclear power plant control and instrumentation in Switzerland, 20:15522 (RA;XA)
Operating and training technical documentation production and management system, 20:15529 (RA;XA)
Operating procedure and operator's decision-making process, 20:15546 (RA;XA)
Operating procedures and maintenance documentation presentation for a NPP control room personal, 20:15542 (RA;XA)
Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992, 20:15527 (R;XA)
Operating procedures within the quality assurance programme, 20:15537 (RA;XA)
Principals and development strategies for procedures with a focus on abnormal situations, 20:15535 (RA;XA)
Procedures development: Common deficiencies and possible solutions, 20:15538 (RA;XA)
Recent activities in the field of nuclear power plant control and instrumentation in Czechoslovakia, 20:15513 (RA;XA)
Recent advancement in the area of Man-Machine Interface, 20:15547 (RA;XA)
Recent development of nuclear power in Japan and instrumentation and control system and control room equipment for advanced light water reactors, 20:15517 (RA;XA)
Recent developments in the field of nuclear power plant control and instrumentation in Hungary, 20:15515 (RA;XA)
Report by the scientific secretary on major IAEA activities during 1989-1991, 20:15508 (RA;XA)
Report on nuclear power plant instrumentation and control in Germany, 20:15525 (RA;XA)
Report on the status of instrumentation and control in Swedish nuclear power plants, 20:15521 (RA;XA)
Safety aspects and human factors in emergency procedure analysis: A survey of GRS activities, 20:15531 (RA;XA)
Situation for plant procedures among the members of the WANO-Paris Centre, 20:15528 (RA;XA)
Some issues of significant electric equipment data presentation to operating personnel, 20:15545 (RA;XA)
Status of instrumentation and control activities in Austria, 1990-1991. Summary, 20:15510 (RA;XA)
Strategy generation in accident management support, 20:15561 (RA;XA)

Free He^4 crystal's face growth rate, 20:17140 (IA;RU;In Russian)

Frequency modulation method for observation of nonstationary Josephson effect in multiple weak-coupling system with random parameters, 20:17059 (IA;RU;In Russian)

Giant geometric oscillations of ultrasound absorption, 20:15878 (IA;RU;In Russian)

Giant magnetostriction in MTG specimens of YBaCuO superconducting state, 20:15990 (IA;RU;In Russian)

Group classification of nonlinear differential systems personal computer, 20:17365 (RA;RU)

Growth and structure of $Bi_2Sr_2CaCu_2O_{8-x}$ epitaxial films on $SrTiO_3$ substrates with CeO_2 and MgO buffer layers, 20:15993 (IA;RU;In Russian)

Hall effect in the $Gd_{1-x}Pr_xBa_2Cu_3O_{7-y}$ system. Comparison with $Y_{1-x}Pr_xBa_2Cu_3O_{7-y}$, 20:15983 (IA;RU;In Russian)

HECAS-2: new version of the computer algebra system for high energy physics, 20:17357 (RA;RU)

Hedrodynamic fluctuations in superfluid helium in spatially bounded systems, 20:17123 (IA;RU;In Russian)

High resolution and high intensity neutron diffraction at the IBR-2 pulsed reactor, 20:16418 (RA;RU)

High-fequency conductivity of high temperarature superconductors, 20:15847 (IA;RU;In Russian)

High-intensity neutron source on the basis of powerful pulsed electron accelerator LIU-30 and pulsed nuclear reactor BR-1, 20:16351 (RA;RU)

High-T_c superconductors from the viewpoint of surface effects, 20:17073 (IA;RU;In Russian)

Homogeneous spin doping of copper planes in $Tl_2Ba_2Ca_2Cu_3O_{1-\delta}$ according to ^{63}Cu, ^{17}O, ^{205}Tl NMR data, 20:17077 (IA;RU;In Russian)

Hybridization contribution into crystal field in compounds $ReCu_2Si_2$ (Re - rare earths), 20:16034 (IA;RU;In Russian)

Impedance of high temperature superconductors in the vicinity of transition temperature in frequency range of 200 to 1000 MHz, 20:16008 (IA;RU;In Russian)

Impurity-stabilized solid helium, 20:17135 (IA;RU;In Russian)

Induced by deformation phase transition in thin samples o-TaS_3, 20:16108 (IA;RU;In Russian)

Influence of matrix composition on superconducting properties of SnTe base solid solutions alloyed with indium, 20:15958 (IA;RU;In Russian)

Influence of physical and chemical adsorption of H_2O molecules on phase state of $YBa_2Cu_3O_{7-\delta}$ HTSC, 20:15957 (IA;RU;In Russian)

Influence of Re electron spectrum fine structure on superconducting transition temperature T_k of Re-Mo and Re-Os alloys, 20:15966 (IA;RU;In Russian)

Influence of real structure and temperature on specific features of luminescence in $YBa_2Cu_3O_{7-\delta}$ HTSC, 20:15924 (IA;RU;In Russian)

Influence of twins and dislocations on critical current and pinning force in single crystal niobium, 20:15861 (IA;RU;In Russian)

Instability of magnetic flux in YBaCuO melt texture grown speeimens, 20:16015 (IA;RU;In Russian)

Integrated system INTERCOMP and computer language for physicists, 20:17358 (RA;RU)

Inter-ion Auger-transitions and current carriers duration in narrow-zone p-type semiconductors with strong hole degeneration, 20:16104 (IA;RU;In Russian)

Interference of transport and shielding currents in $Bi_2Sr_2CaCu_2O_x$ single crystals, 20:15955 (IA;RU;In Russian)

Internal photoeffect and elastic properties of $Pb_{0.997}Ga_{0.003}Te$, 20:16102 (IA;RU;In Russian)

International Seminar on Advanced Pulsed Neutron Sources PANS-II. Invited talks, 20:16348 (R;RU)

Interrelation between T_c and anisotropy of $La_{2-x}Sr_xCuO_4$ crystal lattice on radiation induced disordering, 20:15948 (IA;RU;In Russian)

Investigation by the NMR method of the critical state in superconductor $Tl_2Ba_2CuO_{6+\delta}$, 20:17080 (IA;RU;In Russian)

Investigation in the infrared spectroscopy range on the synchrotron radiation beam of HTSC film emission, 20:17088 (IA;RU;In Russian)

Investigation of a system of equations to calculate the charged particle beam emittance, 20:16358 (RA;RU)

Investigation of betatron oscillations in the vicinity of nonlinear resonance in cyclic accelerators using analytical computer calculations, 20:16359 (RA;RU)

Investigation of the behaviour of superconducting Nb in a magnetic field by the polarized neutron transmission technique, 20:17048 (IA;RU;In Russian)

Investigation of the detecting response of superconducting structures on the frequency up to 2 THz, 20:17083 (IA;RU;In Russian)

Isotopic shift of T_c in LSCO with 3d-impurities, 20:15929 (IA;RU;In Russian)

IV International Conference on Computer Algebra in Physical Research. Collection of abstracts, 20:17356 (R;RU)

Jump creep and interaction of magnetic vortices in inhomogeneous supreconductors, 20:17056 (IA;RU;In Russian)

Kinetic equations and temperature dependence of electric conductivity in HTSC normal phase, 20:15964 (IA;RU;In Russian)

Kinetics of oxygen sublattice ordering in $TmBa_2Cu_3O_{6.6}$ at room temperature, 20:15974 (IA;RU;In Russian)

Kinetics of plastic deformation of Ti-O solid solutions at temperatures 1 K ad below, 20:15868 (IA;RU;In Russian)

Krypton irradiation effect on pinning and creep in $Bi_2Sr_2CaCu_2O_x$ single crystals, 20:15963 (IA;RU;In Russian)

Laser spectroscopy of metastable $RG(^3P_{0,2})$ atoms in liquid and solid helium, 20:17134 (IA;RU;In Russian)

Lateral magnetoresistance of YBCO single crystals with various oxygen contents, 20:15927 (IA;RU;In Russian)

Liquid ^3He relaxation in confined geometry between dielectric crystals, 20:17127 (IA;RU;In Russian)

Localization effects and superconductivity in two-dimensional beryllium films, 20:15863 (IA;RU;In Russian)

Localized and low measuring phonons in multilayer crystals, 20:16023 (IA;RU;In Russian)

Logarithmic relaxation of electric conductivity related to a glass state of oxygen subsystem in bismuth HTSC, 20:15995 (IA;RU;In Russian)

Logarithmic relaxation of electric conductivity and phase transitions in now cluster chalcohenides $Re_{4-x}Mo_xS_4Te_4$, 20:15873 (IA;RU;In Russian)

Longitudinal Structure Function F_L as Function of F_2 and $dF_2/d\ln Q^2$ at Small x, 20:16851 (R;XJ)

Low temperature magnetic ordering in $YBa_2Cu_3O_{6.9}$ irradiated by fast neutrons, 20:15962 (IA;RU;In Russian)

Low temperature properties of $Nd(CCl_3COO)_32H_2O$ crystal with chain structure, 20:16091 (IA;RU;In Russian)

Low-frequency excitations in Nd_2CuO_4 and Pr_2CuO_4 oxides, 20:16987 (IA;RU;In Russian)

Low-frequency plasma oscillations in the phase slip centers, 20:17047 (IA;RU;In Russian)

Low-temperature conductivity and magnetic resistance of filament semiconductor crystals, 20:16101 (IA;RU;In Russian)

Magnetic and electric properties of new semimagnetic semiconductor $Hg_{1-x}Mn_xTe_{1-y}Se_y$, 20:16097 (IA;RU;In Russian)

Magnetic field penetration into powders from anisotropic superconductor, 20:15853 (IA;RU;In Russian)

Magnetic frustration contribution into susceptibility of rare earth isostructural analogs of high-temperature superconductors, 20:16025 (IA;RU;In Russian)

Magnetic penetration depth in $BaPb_{1-x}Bi_xO_3$ measured by μSR, 20:15856 (IA;RU)

Magnetic phase diagram of $YBa_2(Cu_{1-x}Fe_x)_3O_{6+y}$ superconductor in wide ranges of temperature and iron and oxygen contents, 20:15931 (IA;RU;In Russian)

Magnetic phase transformations in chain Ising's antiferromagnetic $CrEr(MoO_4)_2$, 20:16029 (IA;RU;In Russian)

Magnetic properties of amorphous $PrNi_5$, 20:16031 (IA;RU;In Russian)

Magnetic properties of dipole magnetic $CsGd(MoO_4)_2$ at low temperatures, 20:16019 (IA;RU;In Russian)

Magnetic properties of laminated superconductors with nodes in the excitation spectrum, 20:17049 (IA;RU;In Russian)

Magnetic shielding at liquid nitrogen temperatures, 20:15992 (IA;RU;In Russian)

Magnetoelastic anomalies and Moessbauer spectrum-peculiarities of holmium monocrystals in the range of magnetic phase transformations, 20:15864 (IA;RU;In Russian)

Magnetogeterogeneous state of structural phase transformations over magnetic field in holmium monocrystal, 20:15867 (IA;RU;In Russian)

Magnetoresistance anisotropy in single crystals of $YBa_2Cu_3O_x$ system in a normal state, 20:15926 (IA;RU;In Russian)

Magnetoresistance of YBCO in a normal state. Relation to superconducting properties, 20:15925 (IA;RU;In Russian)

Magnetostriction oscillations in manganese doped bismuth ceramics of 2223 type, 20:15951 (IA;RU;In Russian)

Mathematical modeling of radiation damage in HTSC materials, 20:15849 (IA;RU;In Russian)

Measurements of ongitudinal magnetic relaxation time in ^3He-^4He liquid solutions at ultralow temperatures, 20:17122 (IA;RU;In Russian)

Measuring of antiferromegnetic susceptibility of Ho^{+3} ions in $HoFeO_3$ on SNIM-2 spectrometer, 20:16021 (IA;RU;In Russian)

Method of the Neutrino Magnetic Moment Measurement up to $3x10^{-12}$ Bohr Magnetons Using Low-Temperature Semiconducting Calorimeter, 20:16852 (R;XJ;In Russian)

Methods and algorithms of perturbative calculations in quantum field theory and their computer implementation. (I) Theory and phenomenological applications, 20:16799 (RA;RU)

Methods and algorithms of perturbative calculations in quantum field theory and their computer implementation. (II) Program packages, 20:16800 (RA;RU)

Model of topological generator (TG) on high-temperature superconductors, 20:17050 (IA;RU;In Russian)

Modeling of ^3He-^4He solid solution phase dissociation, 20:17128 (IA;RU;In Russian)

Modelling of low-temperature phases of solid C_{60}, 20:16100 (IA;RU;In Russian)

Multivalence of critical current of Josephson lattices, 20:15850 (IA;RU;In Russian)

Narrow lines of complex magnetic susceptibility in the vicinity of a frozen field in submicron particles of $YBa_2Cu_3O_{6+x}$ produced according to zol-gel technology, 20:16003 (IA;RU;In Russian)

Neutron depolarization in the rotating $YBa_2Cu_3O_{6.9}$, 20:17065 (IA;RU;In Russian)

Neutron optics facilities at IBR-2 high flux pulsed reactor, 20:15587 (RA;RU)

A positron lifetime study of radiation defects in proton-irradiated Si, 20:16972 (IA;JP;In Japanese)

Angular dependence of the neutral fraction of medium-energy hydrogen emerging from $NiSi_2(111)$,, 20:16999 (IA;JP;In Japanese)

Annealing behaviour of hydrogen in aluminium implanted silicon, 20:17002 (IA;JP;In Japanese)

Application of plasma driven permeation to the study on deuterium diffusion and trapping in metals, 20:15844 (IA;JP;In Japanese)

Basic study on the secondary hydride in zircaloy cladding by the nuclear reaction $D(^3He,p)^4He$ and thermal desorption, 20:15843 (IA;JP;In Japanese)

Basic study on the secondary hydride in zircaloy claddings by means of the nuclear reaction analysis, 20:15478 (IA;JP;In Japanese)

Characterization of copper thin films prepared by metal self-ion beam sputter deposition, 20:15222 (IA;JP;In Japanese)

Characterization of single crystalline semiconductors by RBS measurements, 20:16969 (IA;JP;In Japanese)

Charge-state distribution of MeV He ions scattered from the surface atoms, 20:17003 (IA;JP;In Japanese)

Chemical characteristics of rain-water, 20:16140 (IA;JP;In Japanese)

Contribution of inner shell electrons to position-dependent stopping powers of a crystal surface, 20:17015 (IA;JP;In Japanese)

Cross sections of electron capture process of low energy ions,, 20:16944 (IA;JP;In Japanese)

Current dependence of secondary-ion yield for SiO_2 bombarded with MeV heavy ions, 20:17009 (IA;JP;In Japanese)

Determination of trace elements in wood, 20:16141 (IA;JP;In Japanese)

Development of stripper films made of high strength, long life carbon nitride, 20:16379 (IA;JP;In Japanese)

Diffusion barrier properties of W between Si and Cu, 20:16973 (IA;JP;In Japanese)

Dissociation of MeV HeH^+ ions at glancing angle incidence on a clean surface of single crystal, 20:17004 (IA;JP;In Japanese)

Dissociative scattering of MeV HeH^+ ions at glancing angle incidence on a crystal surface, 20:17014 (IA;JP;In Japanese)

Dynamics of vibrationally exited molecules in rare gas matrix, 20:16190 (IA;JP;In Japanese)

Epitaxial growth of Al films on sapphire substrates, 20:17006 (IA;JP;In Japanese)

Epitaxial growth of Al/Al_2O_3 multilayer structures, 20:16968 (IA;JP;In Japanese)

Experimental studies on the plasma-driven permeation of deuterium through nickel under plasmas, 20:17169 (IA;JP;In Japanese)

High energy ion beam mixing, 20:17005 (IA;JP;In Japanese)

Imperfection of GaAs/Si layers studied by RBS, SR-SAXS and TEM, 20:16970 (IA;JP;In Japanese)

In situ observations of trapped deuterium in iron pre-bombarded with ^3He ions, 20:17249 (IA;JP;In Japanese)

In-situ study of layer-by-layer growth of PbSe(111) surface by specularly reflected ion spectroscopy, 20:16966 (IA;JP;In Japanese)

Increased aluminum content in the spinal cord of amyotrophic lateral sclerosis and Parkinsonism-dementia of Guam and in the Kii Peninsula of Japan, 20:16142 (IA;JP;In Japanese)

Influence of electron radiation on fracture behavior of CFRP, 20:16082 (IA;JP;In Japanese)

Ion induced damage production and recovery in silicon, 20:17013 (IA;JP;In Japanese)

Irradiation effects of Ar cluster ion beams on Si substrates, 20:16079 (IA;JP;In Japanese)

Irradiation effects of neutrons and electrons in semiconductors, 20:16077 (IA;JP;In Japanese)

Irradiation effects on solid breeder materials of fusion reactor, 20:17248 (IA;JP;In Japanese)

Irradiation-effects of CO_2 cluster ion beams on solid surface, 20:17017 (IA;JP;In Japanese)

Lattice defects in electron irradiated Si studied by positron lifetime spectroscopy, 20:16081 (IA;JP;In Japanese)

Lattice defects in electron-irradiated $CoSi_2$ studied by positron-lifetime spectroscopy, 20:16080 (IA;JP;In Japanese)

MeV ion induced damage production and accumulation in silicon, 20:16078 (IA;JP;In Japanese)

Neutralization of intermediate-velocity Li emerging from Cs- and O-covered Si(100) surface, 20:17008 (IA;JP;In Japanese)

Obserbations of hydrogen traps produced in nickel bombarded with helium-3, helium-4 and hydrogen ions, 20:16964 (IA;JP;In Japanese)

Observation of lattice defect in semiconductors. Examination of the accuracy of minimum yield measurement in the channeling method. 2, 20:17012 (IA;JP;In Japanese)

PIXE analysis for trace-elements in dust-particles, 20:16139 (IA;JP;In Japanese)

Positron lifetime study of vacancies and their clusters in Ti_3Al, 20:16971 (IA;JP;In Japanese)

Preparation of thin oxide films using ion beam mixing effect, 20:17016 (IA;JP;In Japanese)

Production cross sections of recoiled Ar ions in charge changing collisions of carbon ions on Ar atoms,, 20:16945 (IA;JP;In Japanese)

Production of low energy beryllium ions utilizing a heavy ion sputtering ion source and its application to electron transfer collisions, 20:17010 (IA;JP;In Japanese)

Production of multiply charged Be ions by bombarding heavy projectiles, 20:17001 (IA;JP;In Japanese)

RBS measurements of optical thin films, 20:16967 (IA;JP;In Japanese)

Secondary ion emission bombarded with MeV heavy ion, 20:17000 (IA;JP;In Japanese)

Study on initial stage of hetero-epitaxial growth by glancing angle scattering of fast ions from surfaces, 20:16965 (IA;JP;In Japanese)
Study on nuclear pyrochemical processing, 20:16249 (IA;JP;In Japanese)
Study on performance of solid breeder materials of fusion reactor, 20:17250 (IA;JP;In Japanese)
Surface functionalization by molten salt electrolytic processes, 20:15842 (IA;JP;In Japanese)
Surface modification of bioactive ceramic by the Zr ion implantation, 20:17007 (IA;JP;In Japanese)
Surface modification of silica glasses for the radiotherapy by using phosphorus ion implantation, 20:17018 (IA;JP;In Japanese)
Synthesis and characterization of novel oxyfluorotungstates, 20:16188 (IA;JP;In Japanese)
Synthesis of graphite intercalation compound of group VI metals and uranium hexafluorides, 20:16187 (IA;JP;In Japanese)
Sythesis of rare earth metal - GIC graphite intercalation compound in molten chloride system, 20:16189 (IA;JP;In Japanese)
The annealing behaviour of hydrogen implanted into Al metal and Al-Si alloy, 20:17011 (IA;JP;In Japanese)

The art and science of magnet design: Selected notes of Klaus Halbach. Volume 2, 20:16265 (R;US)

Lawrence Livermore National Lab., CA (United States)
A cross-cultural mentoring program, 20:15643 (R;US)
A human engineering and ergonomic evaluation of the security access panel interface, 20:15212 (R;US)
A methodology for assessing the impact of mutagens on aquatic ecosystems. Final report, 20:16592 (R;US)
A numerical simulation of groundwater flow and contaminant transport on the Cray T3D and C90 supercomputers, 20:16564 (R;US)
A probabilistic risk assessment of the LLNL Plutonium Facility's evaluation basis fire operational accident. Revision 1, 20:16281 (R;US)
Accounting for predictive uncertainty in a risk analysis focusing on radiological contamination of groundwater, 20:15184 (R;US)
Automated volumetric grid generation for finite element modeling of human hand joints, 20:17403 (R;US)
Benchmarking of multiple preequilibrium routines in GNASH, 20:16922 (R;US)
Bite the apple, get driven out of the garden: A risky story telling at the ASME town meeting, 20:15668 (R;US)
Calculation of a residual mean meridional circulation for a zonal-mean tracer transport model, 20:16513 (R;US)
Can inertial electrostatic confinement work beyond the ion-ion collisional time scale?, 20:17268 (R;US)
Characterization inconsistencies in CdTe and CZT gamma-ray detectors, 20:16435 (R;US)
Characterization of waste drums using nonintrusive active and passive computed tomography, 20:15048 (R;US)
Chemical and biological systems for regenerating activated carbon contaminated with high explosives, 20:16563 (R;US)
CHEMSODE: A stiff ODE solver for the equations of chemical kinetics, 20:16195 (R;US)
Computer-controlled radiation monitoring system, 20:16436 (R;US)
Creep of a fine-grained, fully-lamellar, two-phase TiAl alloy at 760°C, 20:15898 (R;US)
Design considerations for NDE systems in a factory setting and the application to transmission manufacture at the Chrysler Transmission Plant in Kokomo, Indiana, 20:16298 (R;US)
Development of a portable ambient temperature radiometric assaying instrument, 20:16434 (R;US)
Development of a tokamak plasma optimized for stability and confinement, 20:17167 (R;US)
Development of the indicator-photopolymer chemistries for multi-analyte sensor arrays, 20:16175 (R;US)
Differences in seismic decoupling with chemical and nuclear explosives, 20:16476 (R;US)
Differencing the diffusion equation on unstructured meshes in 2-D, 20:16937 (R;US)
DOE Integrated Security System (DISS) preliminary communication security analysis, 20:17400 (R;US)
EBIT: Electron Beam Ion Trap V-Division Experimental Physics annual report 1993, 20:16761 (R;US)
Electron transport in radiotherapy using local-to-global Monte Carlo, 20:16613 (R;US)
Empirical validation of the conceptual design of the LLNL 60-kg contained-firing facility, 20:16465 (R;US)
Energy & Technology Review, December 1994, 20:17265 (R;US)
Engineering research, development and technology, 20:15680 (R;US)
Excitation mechanisms of $2s_{1/2}$-$2p_{3/2}$ and $2p_{1/2}$-$2p_{3/2}$ transitions in U^{82+} through U^{89+}, 20:16949 (R;US)
Executive summary of NWET applications for NIF workshop, 20:16473 (R;US)
Expedited demonstration of molten salt mixed waste treatment technology. Final report, 20:15047 (R;US)
Experiments and computer simulations of the dynamic cavity formed by a particulated shaped-charge jet in sand, 20:16468 (R;US)

Experiments with highly charged ions up to bare U^{92+} on the electron beam ion trap, 20:16941 (R;US)
Femtosecond, Cr^{4+}:YAG laser, 20:16336 (R;US)
Future scientific applications for high-energy lasers, 20:16777 (R;US)
Ground plane insulating coating for proximity focused devices, 20:16445 (PA;US)
High-resolution superconducting x-ray spectrometers with aluminum trapping layers of different thicknesses, 20:16453 (R;US)
High-speed, high-resolution observations of shaped-charge jets undergoing particulation, 20:16469 (R;US)
Human health risks from TNT, RDX, and HMX in environmental media and consideration of the US Regulatory Environment, 20:16711 (R;US)
Image enhancement by edge-preserving filtering, 20:17401 (R;US)
Implementation and performance of the pseudoknot problem in sisal, 20:17402 (R;US)
Investigation of the particle selectivity of a traveling potential wave; neon isotope separation with the Solitron process. Final report, 20:15219 (R;US)
KINETICSV3.2. A Computer Program to Analyze Chemical Reaction Rate Data, 20:17337 (CM;US)
KINETICSV3.2. A Computer Program to Analyze Chemical Reaction Rate Data, 20:17338 (CM;US)
KUCHEN: An experiment to evaluate decoupling in high-aspect-ratio cavities, 20:16477 (R;US)
Laboratory directed research and development on disposal of plutonium recovered from weapons. FY1994 final report, 20:15388 (R;US)
Large-eddy simulation of the development of stably-stratified atmospheric boundary layers over cool flat surfaces, 20:16516 (R;US)
Large-eddy simulation of turbulent flow using the finite element method, 20:16294 (R;US)
Measurements of a 1/4-scale model of a 60-kg explosives firing chamber, 20:16466 (R;US)
Measurements of a 1/4-scale model of an explosives firing chamber, 20:16467 (R;US)
Measurements of stability margins and current distribution in large-scale Nb_3Sn cable-in-conduit conductors, 20:17269 (R;US)
Metallic laminates for engine applications, 20:16121 (R;US)
Method for spatially uniform electroplating and apparatus therefor, 20:16330 (PA;US)
Monthly report to LLNL from the Budker INP. Novosibirsk, September, 1992, 20:17189 (R;US)
Movement of outdoor particles to the indoor environment: An analysis of the Arnhem Lead Study, 20:15767 (R;US)
NASA FBL/PBW Program. NASA Boeing 757 HIRF test plan: Low power on-the-ground tests, 20:15774 (R;US)
National strategic challenges and the role of Lawrence Livermore National Laboratory, 20:15681 (R;US)
Numerical simulation of the Langevin equation for skewed turbulence, 20:16515 (R;US)
Photonuclear reactions in the GNASH code: Benchmarking model calculations for reactions on lead up to 140 MeV, 20:16923 (R;US)
Prediction method abstracts, 20:16599 (R;US)
Preliminary field evaluation of high efficiency steel filters, 20:16280 (R;US)
Production and preliminary testing of multianalyte imaging sensor arrays, 20:16449 (R;US)
Program EPICP: Electron photon interaction code, photon test module. Version 94.2, 20:16936 (R;US)
Radar imagery from the 1994 Loch Linnhe trials, 20:16279 (R;US)
Rationale and summary of methods for determining ultrasonic properties of materials at Lawrence Livermore National Laboratory, 20:16297 (R;US)
Reaction progress pathways for glass and spent fuel under unsaturated conditions, 20:15148 (R;US)
Recent results from the DIII-D tokamak and implications for future devices, 20:17242 (R;US)
Recent upgrades and enhancements of the FEM3A model, 20:16514 (R;US)
Reflectivity of plasmas created by high-intensity, ultra-short laser pulses, 20:17270 (R;US)
Retardation of volatile organic compounds in ground water in low organic carbon sediments, 20:16591 (R;US)
Risk from a compressed toxic gas system: Part 1, Dispersal probability, 20:15185 (R;US)
Simulation of fracture in compression using a field-theory model, 20:16122 (R;US)
Single event and TREE latchup mitigation for a star tracker sensor: An innovative approach to system level latchup mitigation, 20:16441 (R;US)
Smart active multiwave sensing with zero background amplitude modulated probes, 20:16176 (R;US)
Stability analysis of the TPX toroidal field coil, 20:17266 (R;US)
Stabilization of inorganic mixed waste to pass the TCLP and STLC tests using clay and pH-insensitive additives, 20:15050 (R;US)
Status of the large-scale dark-matter axion search, 20:16778 (R;US)
Studies of highly charged ions with EBIT and Super-EBIT, 20:16762 (R;US)
Synthesis and characterization of nanophase face-centered-cubic titanium, 20:15899 (R;US)
The Cooperative On-site Sampling and Analysis Experiment (COSAX), 20:16479 (R;US)
The HYLIFE-II inertial fusion energy power plant concept and implications for IFE, 20:17267 (R;US)
The Mixed Waste Management Facility monthly report for November 1994, 20:15046 (R;US)
Three dimensional imaging of DNA fragments during electrophoresis using a confocal detector, 20:16606 (R;US)
Transfer of Air Force technical procurement bid set data to small businesses, using CALS and EDI: Test report, 20:16459 (R;US)
Treatment of mixed waste coolant, 20:15051 (R;US)
Utilization of Cs^{137} to generate a radiation barrier for weapons grade plutonium immobilized in borosilicate glass canisters. Revision 1, 20:15049 (R;US)
Visualization methods for high-resolution, transient, 3-D, finite element situations, 20:17404 (R;US)
Wall stabilization of high beta plasmas in DIII-D, 20:17166 (R;US)
Wavelengths measurements of the He-like krypton K-shell spectrum, 20:16950 (R;US)

LDP Associates (United States)
Advanced direct liquefaction concepts for PETC generic units. Quarterly technical progress report, July–September 1994, 20:14728 (R;US)

Lehigh Univ., Bethlehem, PA (United States). Dept. of Chemistry
Coal surface structure and thermodynamics. Final report, 20:14745 (R;US)

Lehigh Univ., Bethlehem, PA (United States). Energy Research Center
Robotic weld overlay coatings for erosion control. Quarterly technical progress report, October 1994–December 1994, 20:15836 (R;US)

Lic Engineering A/S, Hellerup (Denmark)
Data reduction and basic analysis, 20:16309 (R;DK)
Extreme waves in design, 20:16306 (R;DK)
Wave group statistics for wave series containing extreme waves, 20:16307 (R;DK)

Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)
Application of NUREG/CR-5999 interim fatigue curves to selected nuclear power plant components, 20:15405 (R;US)
Case study and presentation of the DOE treatability group concept for low-level and mixed waste streams, 20:14993 (R;US)
Development of proposed free release criteria for Idaho National Engineering Laboratory lead, 20:16248 (R;US)
Fusion Safety Program annual report, fiscal year 1994, 20:17247 (R;US)
Hazard classification for the supercritical water oxidation test bed. Revision 1, 20:15177 (R;US)
Markets for reactor-produced non-fission radioisotopes, 20:15231 (R;US)
RCRA designation of discarded americium/beryllium sealed sources, 20:14969 (R;US)
TEAM. Technology Evaluation and Analysis Methodology Systems Analysis, 20:17339 (CM;US)
Test plan for glove box testing with the real-time transuranic dust monitor, 20:16407 (R;US)

Lomax Exploration Co., Denver, CO (United States)
Green River Formation Water Flood Demonstration Project, Uinta Basin, Utah. Quarterly technical progress report, October 1, 1994–December 31, 1994, 20:14826 (R;US)

Los Alamos National Lab., NM (United States)
A collisionless shock wave experiment, 20:16775 (R;US)
A self-assaying tritium storage bed for ITER, 20:17255 (R;US)
A two-timescale approach to nonlinear Model Predictive Control, 20:17373 (R;US)
A valence-fluctuation mechanism with highly anisotropic S-wave pairing, 20:16044 (R;US)
ABC Technology Development Program, 20:14999 (R;US)
Accelerator-based conversion (ABC) of weapons plutonium: Plant layout study and related design issues, 20:15005 (R;US)
Alpha characterization of concrete surfaces at Decontamination & Decommissioning (D&D) sites, 20:16679 (R;US)
An evaluation of commercialization mechanisms for the Clean Coal Technology Program, 20:14795 (R;US)
Approaches to implementing deterministic models in a probabilistic framework, 20:17379 (R;US)
APT cost scaling: Preliminary indications from a Parametric Costing Model (PCM), 20:16353 (R;US)
Assay of potentially contaminated propellant, 20:16456 (R;US)
Authentication of reprocessing plant safeguards data through correlation analysis, 20:14914 (R;US)
Base hydrolysis and hydrothermal processing of PBX-9404 explosive, 20:16461 (R;US)
Base hydrolysis and hydrothermal processing of PBX-9404 explosive, 20:16192 (R;US)
Basic science with pulsed power & some off-the-wall ideas, 20:17257 (R;US)
Bicriteria network design problems, 20:17374 (R;US)
Biomorphic robots as a persistent means for removing explosive mines, 20:16460 (R;US)
Bolt preload selection for pulsed-loaded vessel closures, 20:16263 (R;US)
Characterization of low level mixed waste at Los Alamos National Laboratory, 20:15001 (R;US)
Chemical and isotopic variations of precipitation in the Los Alamos Region, New Mexico, 20:16500 (R;US)
Demonstration of "regulatory" process controls on the TSTA cryogenic distillation system, 20:17256 (R;US)
Detection of contaminants along boreholes with prompt gamma spectroscopy, 20:16426 (R;US)
Deuteron and anti-deuteron production in CERN experiment NA44, 20:16920 (R;US)
Directional fast-neutron detector, 20:16430 (PA;US)
Ductile damage model with void coalescence, 20:15885 (R;US)
Dynamics of current driven disordered Josephson junction arrays, 20:17118 (R;US)
Faddeev calculations of $p\mu+p$ collisions: Effect of hyperfine splitting on the cross sections, 20:16946 (R;US)
Forging strategic partnerships with industry: The Industrial Fellows Program, 20:15673 (R;US)
High performance systems, 20:17372 (R;US)
Hot dry rock energy: Hot dry rock geothermal development program. Progress report. Fiscal year 1993, 20:15314 (R;US)
Hydrostatic extrusion of BSCCO/Ag composite wire, 20:16112 (R;US)
Influence of strain rate and temperature on the mechanical behavior of iron aluminide-based alloys, 20:15888 (R;US)
Introduction to spallation physics and spallation-target design, 20:15004 (R;US)
Lead-free glovebox glove, 20:16269 (PA;US)
Low-density ionization behavior, 20:16774 (R;US)
Misuse and intrusion detection at Los Alamos National Laboratory, 20:15210 (R;US)
Nonlinear elastic wave interaction in a sandstone bar: A summary of recent pulse-mode experiments, 20:16714 (R;US)
Numerical analysis of the ultraprecision machining of copper, 20:15886 (R;US)
Numerical implementation of a state variable model for friction, 20:15887 (R;US)
Off-training-set error for the Gibbs and the Bayes optimal generalizers, 20:17376 (R;US)
On the possibility of a two-state magnetic structure for nanocrystalline chromium, 20:15816 (R;US)
On-line surfactant monitoring, 20:16161 (R;US)
Open architecture CNC system, 20:15889 (R;US)
Periodically specified problems: An exponential complexity gap between exact and approximate solutions, 20:17375 (R;US)
Potential chemical hazards during retrieval of TRU waste drums, 20:15002 (R;US)
Progress towards antihydrogen production by the reaction of cold antiprotons with positronium atoms, 20:16956 (R;US)
Proliferation resistance criteria for fissile material disposition, 20:15209 (R;US)
Reaction chemistry of nitrogen species in hydrothermal systems: Simple reactions, waste simulants, and actual wastes, 20:15655 (R;US)
Recent results from NA44 and a review of HBT, 20:16921 (R;US)
Sensor fusion and nonlinear prediction for anomalous event detection, 20:17378 (R;US)
Solution based temperature of Perovskite-type oxide films and powders, 20:16043 (R;US)
Sonication standard laboratory module, 20:16451 (PA;US)
Space-based RF signal classification using adaptive wavelet features, 20:16474 (R;US)
Stacked generalization, 20:17381 (PA;US)
Status of volcanism studies for the Yucca Mountain Site Characterization Project, 20:14998 (R;US)
Storage of nuclear materials by encapsulation in fullerenes, 20:15014 (PA;US)
Structural analysis of Precambrian rocks at the Hot Dry Rock Site at Fenton Hill, New Mexico, 20:15315 (R;US)
Synthesis of 3,3-dinitroazetidine, 20:16463 (PA;US)
Technology assessment of RDX production, 20:16462 (R;US)
The performance of neutron scattering spectrometers at a long-pulse spallation source, 20:16427 (R;US)
The physics design of accelerator-driven transmutation systems, 20:15003 (R;US)
The safeguards options study, 20:15208 (R;US)
The use of deterministic codes for "separating the wheat from the chaff" in benchmark models and calculations, 20:15592 (R;US)
Training neural networks using sequential extended Kalman filtering, 20:17377 (R;US)
Waste gas combustion in a Hanford radioactive waste tank, 20:15000 (R;US)

Los Alamos Technical Associates, Inc., Kennewick, WA (United States)
Tank 241-U-203: Tank Characterization Plan, 20:15125 (R;US)

Louisiana State Univ., Baton Rouge, LA (United States)
Low energy solar neutrino experiments: The Soviet American Gallium Experiment (SAGE). Final report, August 12, 1988–October 31, 1994, 20:16763 (R;US)

Louisiana State Univ., Baton Rouge, LA (United States). Center for Coastal, Energy, and Environmental Resources
Analysis of environmental constraints on expanding reserves in current and future reservoirs in wetlands. Final report, 20:14866 (R;US)

Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Chemical Engineering
A calcium oxide sorbent process for bulk separation of carbon dioxide. Final report, 20:14720 (R;US)
Advanced sulfur control concepts for hot gas desulfurization technology. Quarterly report, October–December 1994, 20:14724 (R;US)

Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Petroleum Engineering
Assist in the recovery of bypassed oil from reservoirs in the Gulf of Mexico. Quarterly status report (final), October 1–December 31, 1994, 20:14817 (R;US)
Assist in the recovery of bypassed oil from reservoirs in the Gulf of Mexico, 20:14818 (R;US)

Louisiana State Univ., Baton Rouge, LA (United States). Intermediate Energy Nuclear Physics Group
The design and construction of the muon arm in PHENIX. Progress report for the period December 15, 1993–December 1, 1994, 20:16397 (R;US)

Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst.
Particulate air pollution and increased mortality: Biological plausibility for causal relationship, 20:16484 (R;US)

Luff Exploration Co., Denver, CO (United States)
Improved recovery demonstration for Williston Basin carbonates. Quarterly report, October 1, 1994–December 31, 1994, 20:14832 (R;US)

Lund Univ. (Sweden). Dept. of Ecology
Methyl mercury in lakes. Factors affecting its production and partitioning between water and sediment, 20:16585 (R;SE)

Lund Univ. (Sweden). Dept. of Heat and Power Engineering
Doppler Global Velocimetry, 20:16252 (R;SE)
Measurements on and simulations of a biogas-fuelled bus, 20:15261 (R;SE;In Swedish)

Maine Metal Products Association, Portland, ME (United States)
Environmentally conscious manufacturing-technology access project: Technical progress report, April 1, 1994–March 30, 1995, 20:15777 (R;US)

Malcolm Pirnie, Inc., Rochester, NY (United States)
Combustion testing and heat recovery study: Frank E. Van Lare Wastewater Treatment Plant, Monroe County. Final report, 20:15257 (R;US)

Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, January 1993–March 1993, 20:14779 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, April 1993–June 1993, 20:14780 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems, Phase 3, Technical progress report, July 1993–September 1993, 20:14781 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems, Phase 3, January 1994–March 1994, 20:14782 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, April 1994–June 1994, 20:14783 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, July 1994–September 1994, 20:14784 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, October 1994–December 1994, 20:14785 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, April 1992–June 1992, 20:14776 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, July 1992–September 1992, 20:14777 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, October 1992–December 1992, 20:14778 (R;US)

Manufacturing Sciences Corp., Oak Ridge, TN (United States)
Advanced technologies for decontamination and conversion of scrap metals, 20:14970 (R;US)

Martin Marietta Astro Space, Philadelphia, PA (United States)
GPHS-RTGs in support of the Cassini RTG Program. Semi annual technical progress report, September 26, 1994–April 2, 1995, 20:15230 (R;US)

Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)
Creep of a fine-grained, fully-lamellar, two-phase TiAl alloy at 760°C, 20:15898 (R;US)
Portsmouth Gaseous Diffusion Plant annual site environmental report for 1993, 20:15145 (R;US)

Martin Marietta Energy Systems, Inc., Piketon, OH (United States)
Portsmouth Gaseous Diffusion Plant annual site environmental report for 1993, 20:15145 (R;US)

Maryland Univ., Baltimore, MD (United States)
Application of best available science to the regulatory process: The case of environmental regulations. Final technical report, February 1990–January 1993, 20:14968 (R;US)

Maryland Univ., College Park, MD (United States). Dept. of Geology
Control of water infiltration into near surface LLW disposal units. Progress report on field experiments at a humid region site, Beltsville, Maryland: Volume 8, 20:15007 (R;US)

Maryland Univ., Princess Anne, MD (United States). Dept. of Natural Sciences
Structure and thermochemical kinetic studies of coal pyrolysis. Final technical report, 20:14727 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States)
Conversion of light hydrocarbon gases to metal carbides for production of liquid fuels and chemicals. Quarterly technical status report, October 1, 1994–December 31, 1994, 20:15274 (R;US)
Harvard-MIT research program in short-lived radiopharmaceuticals. Final report, 20:16608 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Chemical Engineering
Direct catalytic decomposition of nitric oxide. Quarterly technical progress report No. 13, October–December 1994, 20:14758 (R;US)
Selective catalytic reduction of sulfur dioxide to elemental sulfur. Quarterly technical progress report No. 7, January–March 1994, 20:14760 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States). Energy Lab.
Environmental impacts of ocean disposal of CO_2. 2nd quarterly report, October 1, 1994–December 31, 1994, 20:15651 (R;US)

Materials Technologies of Virginia, Inc., Blacksburg, VA (United States)
Whisker reinforced glass ceramic. Quarterly progress report number 2, December 27, 1994–March 27, 1995, 20:15913 (R;US)

Max-Planck-Institut fuer Physik, Muenchen (Germany)
Study of a novel electromagnetic liquid argon calorimeter - the TGT, 20:16428 (R;DE)
Testing and further development of a low-noise Si radiation detector, 20:16429 (R;DE;In German)

Max-Planck-Institut fuer Stroemungsforschung, Goettingen (Germany)
A parametric study of film condensation of pure gases and mixtures with non-condensable gas in a shock tube, 20:16290 (R;DE;In German)

Media and Process Technology, Inc., Pittsburgh, PA (United States)
Advanced coal liquefaction. Final quarterly report, July 1, 1994–September 31, 1994, 20:14734 (R;US)

Michigan Technological Univ., Houghton, MI (United States)
Recovery of bypassed oil in the Dundee Formation using horizontal drains. Quarterly report, October 1994–December 1994. 1st Quarter, FY 1995, 20:14831 (R;US)
Visual display of reservoir parameters affecting enhanced oil recovery, 20:14824 (R;US)

Miljoe- og Energiministeriet, Copenhagen (Denmark)
Environmental indicators 1994, 20:16502 (R;DK;In Danish)

Miljoestyrelsen, Copenhagen (Denmark)
Financial assistance to environmentally protective activities in Eastern and Central Europe. Annual report for 1993, 20:15676 (R;DK;In Danish)
Recycling. Trends in development and integration of recycling in waste management in Europe, 20:15801 (R;DK)

Minerals Management Service, Herndon, VA (United States)
Federal Offshore Statistics, 1993. Leasing, exploration, production, and revenue as of December 31, 1993, 20:14852 (R;US)

Ministerium fuer Wirtschaft, Mittelstand und Technologie des Landes Nordrhein-Westfalen, Duesseldorf (Germany)
Report on the activities of the mining authorities in the Land North-Rhine Westphalia in 1993/94, 20:14767 (I;DE;In German)

Ministry of Energy and Mineral Resources, Amman (Jordan)
Biomass energy in Jordan, and its potential contribution towards the total energy mix of the Kingdom, 20:15258 (R;JO;In Arabic)
Effects of low level ionizing radiation, 20:16670 (I;JO;In Arabic)
Geothermal energy in Jordan, 20:15329 (R;JO)
Radiation protection code of practice, 20:15215 (I;JO;In Arabic)
Uses of geothermal energy in Jordan for heating greenhouses; project proposal, 20:15330 (R;JO)

Ministry of Trade and Industry, Helsinki (Finland). Energy Dept.
Publicly administrated nuclear waste management research programme 1994-1996. General plan for the research programme and research plan for 1994, 20:14997 (R;FI)

Minnesota Science Museum, St. Paul, MN (United States)
Green Street™: A comprehensive urban energy and environmental exhibit and education project. Final report, September 1, 1992–August 31, 1994, 20:15802 (R;US)

Minnesota Univ., Minneapolis, MN (United States)
Hot coal gas desulfurization with manganese based sorbents. Quarterly report, June–September 1994, 20:14722 (R;US)

Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab.
Diagnostic development and support of MHD test facilities. Technical progress report, January 1992–February 1992, 20:15720 (R;US)
Diagnostic development and support of MHD test facilities. Technical progress report, July 1991–September 1991, 20:15721 (R;US)
Diagnostic development and support of MHD test facilities. Technical progress report, April 1992–June 1992, 20:16450 (R;US)
Diagnostic development and support of MHD test facilities. Technical progress report, July 1992–September 1992, 20:15722 (R;US)
Diagnostic development and support of MHD test facilities. Final technical progress report, October 1992–September 1993, 20:15723 (R;US)
Multi-color pyrometer temperature measurement system. Topical report 10, 20:14771 (R;US)
Particle size distribution instrument. Topical report 13, 20:15725 (R;US)
Potassium emission absorption system. Topical report 12, 20:15724 (R;US)

Monroe County Dept. of Engineering, Rochester, NY (United States)
Combustion testing and heat recovery study: Frank E. Van Lare Wastewater Treatment Plant, Monroe County. Final report, 20:15257 (R;US)

Monsanto Research Corp., Miamisburg, OH (United States)
Method for plating with metal oxides, 20:16045 (PA;US)

Morgan State Univ., Baltimore, MD (United States). School of Engineering
Analysis/control of in-bed tube erosion phenomena in the fluidized bed combustion (FBC) system. Technical progress report No. 9, [October 1, 1994–December 31, 1994], 20:14775 (R;US)
Impact of nonequilibrium particle temperature considerations on seeded coal combustion plasma properties. Quarterly report, quarter No. 10, January 1, 1993–March 30, 1993, 20:17142 (R;US)
Impact of nonequilibrium particle temperature considerations on seeded coal combustion plasma properties. Quarterly report, quarter No. 12, July 1, 1993–September 30, 1993, 20:17143 (R;US)

Morrison-Knudsen Corp., Boise, ID (United States). Environmental Services Div.
Waste management facilities cost information estimating data, 20:15130 (R;US)

Muenchen Univ. (Germany). Sektion Physik
Testing and further development of a low-noise Si radiation detector, 20:16429 (R;DE;In German)

N

National Academy of Sciences - National Research Council, Washington, DC (United States)
Activities of the National Academy of Sciences in relation to the Radiation Effects Research Foundation. Progress report, June 1, 1993–September 30, 1994, 20:16665 (R;US)

Oak Ridge K-25 Site, TN (United States)
Criticality safety aspects of K-25 Building uranium deposit removal, 20:16258 (R;US)
Preliminary investigation of steel compatibility with potential materials of construction for UF6 cylinder chocks, 20:14934 (R;US)
Y-12 Plant decontamination and decommissioning technology logic diagram for Building 9201-4. Volume 2: Technology logic diagram, 20:15201 (R;US)
Y-12 Plant decontamination and decommissioning technology logic diagram for Building 9201-4. Volume 3: Technology evaluation data sheets; Part A: Characterization, dismantlement, 20:15202 (R;US)
Y-12 Plant decontamination and decommissioning technology logic diagram for Building 9201-4. Volume 3: Technology evaluation data sheets; Part B: Decontamination, robotics/automation, waste management, 20:15203 (R;US)

Oak Ridge National Lab., TN (United States)
A comparison of the effect of radiation on the thermal conductivity of sapphire at low and high temperature, 20:17236 (RA;US)
A Continuous Automated Vault Inventory System (CAVIS) for accountability monitoring of stored nuclear materials, 20:15213 (R;US)
A performance evaluation of coating systems for long term aqueous immersion service, 20:15903 (R;US)
A posteriori pointwise error estimates for the boundary element method, 20:17380 (R;US)
Ab initio calculations for hydrogen adsorption on lithium oxide surfaces, 20:17229 (RA;US)
Aging and service wear of spring-loaded pressure relief valves used in safety-related systems at nuclear power plants, 20:15604 (R;US)
Amorphization threshold in Si-implanted strained SiGe alloy layers, 20:16058 (R;US)
An expert system for enhancing compliance with hazardous materials packaging and transportation regulations, 20:15646 (R;US)
Analysis of grain boundaries in a V-5Cr-5Ti alloy using Auger Electron Spectroscopy, 20:15833 (RA;US)
Analysis of source term modeling for low-level radioactive waste performance assessments, 20:15012 (R;US)
Analysis of well hydrographs in a karst aquifer: Estimates of specific yields and continuum transmissivities, 20:15139 (R;US)
Annual summary report of the Decontamination and Decommissioning Surveillance and Maintenance Program at Oak Ridge National Laboratory for period ending September 30, 1994, 20:15009 (R;US)
Are self-directed work teams successful and effective tools for today's organization?, 20:15644 (R;US)
Atom probe field ion microscopy characterization of vanadium-titanium-chromium alloys, 20:15832 (RA;US)
Bonneville Power Administration Communication Alarm Processor (CAP). Final report, 20:15614 (R;US)
Buckling analysis of an underground storage tank on the Oak Ridge Reservation, 20:16261 (R;US)
Calculations to determine the feasibility of using a boron carbide shield for spectral tailoring in the HFIR for vanadium alloy irradiation-R, 20:17205 (RA;US)
Calendar year 1993 groundwater quality report for the Upper East Fork Poplar Creek hydrogeologic regime Y-12 Plant, Oak Ridge, Tennessee: 1993 groundwater quality data interpretations and proposed program modifications, 20:15136 (R;US)
Carbon dioxide concentrations in surface water and the atmosphere during 1986–1989 NOAA/PMEL cruises in the Pacific and Indian Oceans, 20:16588 (R;US)
Characterization of phosphorus segregation in neutron-irradiated pressure vessel steels by atom probe field ion microscopy, 20:15819 (R;US)

Chemical and mechanical interactions of interstitials in V-5%Cr-5%Ti, 20:17218 (RA;US)
Chemical characteristics of waters in Karst Formations at the Oak Ridge Y-12 Plant, 20:16577 (R;US)
Computer-aided coordination and overcurrent protection for distribution systems, 20:15615 (R;US)
Consequences of no postweld heat treatment on the fracture toughness of low activation martensitic steels, 20:15825 (RA;US)
Contaminated nickel scrap processing, 20:15011 (R;US)
Copper alloys for high heat flux structure applications, 20:17222 (RA;US)
Cracking during nanoindentation and its use in the measurement of fracture toughness, 20:16295 (R;US)
Creep analysis of fuel plates for the Advanced Neutron Source, 20:15479 (R;US)
Criticality safety considerations for low-level-waste facilities, 20:16259 (R;US)
Data base on permeation, diffusion, and concentration of hydrogen isotopes in fusion reactor materials, 20:17209 (RA;US)
Decontamination of surfaces by blasting with crystals of H_2O and CO_2, 20:15179 (R;US)
Defect energetics calculations of SiC using three representative empirical potentials, 20:17233 (RA;US)
Dependence of vanadium alloy density on starting composition, transmutation and segregation, 20:17221 (RA;US)
Design demonstrations for Category B tank systems piping at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:14972 (R;US)
Determination of site-occupancies in aluminide intermetallics by ALCHEMI, 20:15820 (R;US)
Development of a tokamak plasma optimized for stability and confinement, 20:17167 (R;US)
Development of ceramic-coated weld backing bars, 20:16050 (R;US)
Development of electrical insulator coatings: In-situ electrical resistance measurements on CaO-coated V-5%Cr-5%Ti in liquid lithium, 20:17227 (RA;US)
Development of low-chromium, chromium-tungsten steels for fusion, 20:17210 (RA;US)
Differences in creep performance of a HIPed silicon nitride in ambient air and inert environments, 20:16061 (R;US)
Drought tolerance and osmotic adjustment of four deciduous tree species under altered precipitation: Preliminary results, 20:16703 (R;US)
Effect of dynamically charged helium on mechanical properties of V-4Cr-4Ti, 20:17216 (RA;US)
Effect of hydrogen on the fracture toughness of a ferritic/martensitic stainless steel, 20:15826 (RA;US)
Electrical properties of Al_2O_3 during irradiation with spallation neutrons, 20:15915 (RA;US)
Environmental Guidance Program reference book: Toxic substances control act. Revision 7, 20:15701 (R;US)
Evaluation of cavity occurrence in the Maynardville Limestone and the Copper Ridge Dolomite at the Y-12 Plant using logistic and general linear models, 20:15138 (R;US)
Fabrication and modification of metal nanocluster composites using ion and laser beams, 20:16057 (R;US)
Fabrication of aluminum nitride and its stability in liquid alkali metals, 20:17226 (RA;US)
Fabrication of vanadium alloy product forms for specimens preparation, 20:15827 (RA;US)
Fatigue Crack Growth Rate (FCGR) behavior of Nicalon/SiC composites, 20:16074 (RA;US)
Field performance of the Walker Branch throughfall displacement experiment, 20:16483 (R;US)
Final report from VFL technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils: LEFPC appendices, volume 1, appendix I-IV, 20:15198 (R;US)
Final report from VFL Technologies for the pilot-scale thermal treatment of lower East Fork Poplar Creek floodplain soils. LEFPC appendices, Volume 4, Appendix V-C, 20:15131 (R;US)
Final report from VFL Technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC appendices. Volume 5. Appendix V-D, 20:15155 (R;US)
Final report from VFL Technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC appendices. Volume 6. Appendix VI-X, 20:15156 (R;US)
Finite-sample based learning algorithms for feedforward networks, 20:17329 (R;US)
First results with the Microball and Gammasphere, 20:16395 (R;US)
Fiscal Year 1993 Well Plugging and Abandonment Program Summary Report Y-12 Plant, Oak Ridge, Tennessee, 20:15206 (R;US)
Fracture toughness of irradiated candidate materials for ITER first wall/blanket structures, 20:17213 (RA;US)
Fracture toughness of V-5Cr-5Ti alloy at room temperature and 100°C, 20:15834 (RA;US)
Gelcasting of sintered reaction-bonded silicon nitride for improved mechanical properties, 20:15911 (R;US)
Geostatistical applications in environmental remediation, 20:17331 (R;US)
Guidance for a large tabletop exercise for a nuclear power plant, 20:15603 (R;US)
HASCAL – A system for estimating contamination and doses from incidents at worldwide nuclear facilities, 20:15169 (R;US)
Health and Safety Research Division. Progress report, April 1, 1993–September 30, 1994, 20:16694 (R;US)
Heavy-section steel irradiation program. Volume 4, No. 2. Semiannual progress report, April 1993–September 1993, 20:15404 (R;US)
Improving the energy efficiency of refrigerators in India, 20:15743 (R;US)
In-tank fluid sloshing effects during earthquakes: A preliminary computational simulation, 20:14965 (R;US)
Influence of flux-spectra differences on transmutation and swelling of vanadium alloys, 20:17220 (RA;US)
Influence of nickel and beryllium content on swelling of copper irradiated in COBRA-1A, 20:17225 (RA;US)
Influence of transmutation on microstructure, density, change, and embrittlement of vanadium and vanadium alloys irradiated in HFIR, 20:17219 (RA;US)
Insights into quick flow in a karst aquifer: Usefulness of infrequently collected geochemical data from wells, 20:16578 (R;US)
Integration of remediation strategy with waste management capabilities and regulatory drivers for radioactive waste storage tanks at the Oak Ridge National Laboratory, 20:14963 (R;US)
Interface degradation in CAS/Nicalon during elevated temperature aging, 20:16059 (R;US)

Using Level 1 PRA for enhanced safety of the Advanced Neutron Source Reactor, 20:15597 (R;US)
Utility DSM Programs from 1989 through 1998: Continuation or cross roads?, 20:15695 (R;US)
Validation of favor code linear elastic fracture solutions for finite-length flaw geometries, 20:15464 (R;US)
Void swelling in binary Fe-Cr alloys at 200 dpa, 20:17208 (RA;US)
Void swelling of pure copper, Cu-5Ni and Cu-5Mn alloys irradiated with fast neutrons, 20:17224 (RA;US)
Wall stabilization of high beta plasmas in DIII-D, 20:17166 (R;US)
Welding development for V-Cr-Ti alloys, 20:15828 (RA;US)
Wet season reconnaissance report on Seeps and Springs in Waste Area Grouping 6 at Oak Ridge National Laboratory. Environmental Restoration Program, 20:15010 (R;US)
Y-12 development organization technical progress report: Part 3 - metal processing, period ending September 1, 1994, 20:15902 (R;US)
Y-12 Plant Decontamination and Decommissioning Technology Logic Diagram for Building 9201-4. Volume 1: Technology evaluation, 20:15200 (R;US)

Oak Ridge National Lab., TN (United States). HAZWRAP Support Contractor Office

Literature search, review, and compilation of data for chemical and radiochemical sensors: Task 1 report, 20:15171 (R;US)

Oak Ridge Y-12 Plant, TN (United States)

An assessment of the radiological doses resulting from accidental uranium aerosol releases and fission product releases from a postulated criticality accident at the Oak Ridge Y-12 Plant, 20:15159 (R;US)
Calendar year 1993 groundwater quality report for the Chestnut Ridge Hydrogeologic Regime Y-12 Plant, Oak Ridge, Tennessee. 1993 Groundwater quality data interpretations and proposed program modifications, 20:15158 (R;US)
Construction quality assurance report for the Y-12 Construction/Demolition Landfill VII (CDL VII), Oak Ridge, Tennessee, 20:15137 (R;US)
Decision document for performing a long-term pumping test at the S-3 Site, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, 20:15204 (R;US)

Determination of halogens in a petroleum product by ion chromatography, 20:14902 (R;US)
Final report for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils, 20:15153 (R;US)
Final report from VFL technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC Appendices, Volume 2, Appendix V-A, 20:15154 (R;US)
Final report from VFL Technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC Appendices, Volume 3, Appendix V-B, 20:15199 (R;US)
Fiscal year 1994 well installation program summary report, Y-12 Plant, Oak Ridge, Tennessee, 20:15157 (R;US)
Post-closure permit application for the Upper East Fork Poplar Creek hydrogeologic regime at the Y-12 Plant: New Hope Pond and Eastern S-3 ponds plume. Revision 2, 20:15205 (R;US)
Sampling and analysis plan for groundwater and surface water monitoring at the Y-12 Plant during calendar year 1995, 20:16576 (R;US)
Seismic hazard evaluation for Department of Energy Oak Ridge Reservations, Oak Ridge, Tennessee, 20:16737 (R;US)
Thermal decomposition of mercuric sulfide, 20:16571 (R;US)
Underground storage tank management plan, 20:15135 (R;US)
Water balance report for the Oak Ridge Y-12 Plant, 20:16573 (R;US)

Oedegaard og Danneskiold-Samsoee ApS, Copenhagen (Denmark)
Vibration analysis of 1 MW gearbox for the Avedoere wind turbine. Test bed measurements, 20:15344 (R;DK)
Vibration and noise analysis of gearbox for NTK 500/37 wind turbine, 20:15342 (R;DK)

Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria)
Electron beam treatment with radical scavengers/enhancers, 20:16201 (R;AT)
Oxidative treatment of a waste water stream from a molasses processing using ozone and advanced oxidation technologies, 20:16203 (R;AT)
Ozone-electron beam treatment for groundwater remediation, 20:16202 (R;AT)

Ohio Coal Development Office, Columbus, OH (United States)
Direct sulfur recovery during sorbent regeneration. Final report, 20:14763 (R;US)

Ohio Univ., Athens, OH (United States). Dept. of Physics and Astronomy
Theory of photon and electron induced reactions. Progress report, July 1, 1994–June 30, 1995, 20:16876 (R;US)

Oklahoma Univ., Norman, OK (United States)
A study of the source material, and mechanisms of generation, and migration of oils in the Anadarko Basin, Oklahoma. Progress report, September 1, 1986–August 31, 1987, 20:14802 (R;US)
Gypsy field project in reservoir characterization. Quarterly report, October 1, 1994–December 31, 1994, 20:14829 (R;US)
Identification and evaluation of fluvial-dominated deltaic (Class 1 oil) reservoirs in Oklahoma. Yearly technical progress report, January 1–December 31, 1993, 20:14825 (R;US)

Oklahoma Univ., Norman, OK (United States). Center for Reservoir Characterization
Gypsy Field Project in reservoir characterization. Revision, Second quarterly report, [October 1, 1994–December 31, 1994], 20:14800 (R;US)

Oklahoma Univ., Norman, OK (United States). Dept. of Aerospace and Mechanical Engineering
Liquid natural gas as a transportation fuel in the heavy trucking industry. Second quarterly progress report, October 1, 1994–December 30, 1994, 20:15812 (R;US)

Oregon Dept. of Fish and Wildlife, Portland, OR (United States)
Willamette oxygen supplementation studies. Annual progress report, 20:15281 (R;US)

Oregon State Univ., Corvallis, OR (United States). Dept. of Nuclear Engineering
General particle transport equation. Final report, 20:16288 (R;US)

Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics
Annual report of Research Center for Nuclear Physics, Osaka University. April 1, 1993 - March 31, 1994, 20:16853 (I;JP)

Oxy USA, Inc., Welch, TX (United States)
Application of reservoir characterization and advanced technology to improve recovery and economics in a lower quality shallow shelf carbonate reservoir. Fourth quarterly technical progress report, [October 1, 1994–December 31, 1994], 20:14833 (R;US)

P

PA Energy A/S, Malling (Denmark)
Danish participation in the European Communities concerted actions on PV systems technology and coordination of PV systems development, task 6: Modelling and simulations. Final report, 20:15291 (R;DK;In Danish, English)

Pacific Northwest Lab., Richland, WA (United States)
A case study: Integrated work environment and organizational change, 20:17315 (R;US)
A man-portable supercritical fluid extractor, 20:16555 (R;US)
A systematic approach for future solid waste cleanup activities at the Hanford Site, 20:15181 (R;US)
A Value of Information approach to data quality objectives for the Hanford high-level waste tanks, 20:15022 (R;US)
Abiotic reduction of aquifer materials by dithionite: A promising in-situ remediation technology, 20:16589 (R;US)
Airborne radionuclides of concern and their measurement in monitoring a Comprehensive Test Ban Treaty, 20:16475 (R;US)
AMTEX first quarter FY95 report, 20:15678 (R;US)
An electronic design guideline for incorporating pollution prevention into U.S. Department of Energy design projects, 20:15021 (R;US)
Application of in situ vitrification in the soil subsurface: Engineering-scale testing, 20:16554 (R;US)
Clean steels for fusion, 20:17259 (R;US)
Computer simulation of mobilization and mixing of kaolin with submerged liquid jets in 25,000-gallon horizontal cylindrical tanks, 20:15016 (R;US)
Designing and implementing customer-focused functional support teams, 20:17314 (R;US)
Direct measurement of strontium-90 and uranium-238 in soils on a real-time basis: 1994 summary report, 20:16553 (R;US)
Energy security in the post-Cold War era: Identifying future courses for crises, 20:15696 (R;US)
Estimation of natural ground water recharge for the performance assessment of a low-level waste disposal facility at the Hanford Site, 20:15017 (R;US)
Geology, hydrology, chemistry, and microbiology of the in situ bioremediation demonstration site, 20:15180 (R;US)
Hanford analytical services quality assurance plan. Revision 1, 20:14979 (R;US)
Hanford Permanent Isolation Barrier Program: Asphalt technology development, 20:16296 (R;US)
Impact evaluation of a mill tailings thickener installed at J.R. Simplot Company's Smoky Canyon Mine under the Energy $avings Plan, 20:15795 (R;US)
In situ mapping of radionuclides in subsurface and surface soils: 1994 Summary report, 20:15146 (R;US)
Integration of pneumatic fracturing and in situ vitrification in the soil subsurface, 20:15020 (R;US)
Interfacial segregation and deformation of superplastically deformed Al-Mg-Mn alloys, 20:15891 (R;US)
Irradiation-assisted stress corrosion cracking considerations at temperatures below 288°C, 20:15890 (R;US)
Low-temperature catalytic gasification of wet industrial wastes. FY 1993–1994 interim report, 20:15247 (R;US)
Mechanisms of iron-based catalysis investigated using model compounds, 20:14743 (R;US)
Membrane mediated separation of tritiated water from water without phase change, 20:15019 (R;US)
Product consistency testing of three reference glasses in stainless steel and perfluoroalkoxy resin vessels, 20:15015 (R;US)
Responding to Agenda 2020: A technology vision and research agenda for America's forest, wood and paper industry, 20:16619 (R;US)
Scaling of cross sections in ion-atom collisions, 20:16947 (R;US)

Sludge pretreatment chemistry evaluation: Enhanced sludge washing separation factors, 20:15018 (R;US)
The potential for microtechnology applications in energy systems: Results of an experts workshop, 20:16331 (R;US)
The value of adding regional to local stakeholder involvement in evaluating the acceptability of innovative technologies, 20:15182 (R;US)

About the existence of Abrikosov vortex state in two-dimensional type-ii superconductors without pinning centers, 20:17082 (IA;RU;In Russian)
Accurate solution of nonlinear discrete model of surface reconstruction and localized structural phase transformations, 20:15869 (IA;RU;In Russian)
Allowance for reversible vortex shift in the critical state model, 20:17060 (IA;RU;In Russian)
Angular dependences of higher harmonics on mutual orientation of constant and alternating magnetic fields, 20:15978 (IA;RU;In Russian)
Anisotropy of critical current in YBCO textured specimens, 20:15946 (IA;RU;In Russian)
Anisotropy of critical current of HTSC ceramics in magnetic field, 20:15975 (IA;RU;In Russian)
Anomalous behaviour of europium Yong modulus and internal friction in the ragion of phase-transformation PM-HAFM, 20:15865 (IA;RU;In Russian)
Anomalous behaviour of the diamagnetic protile of superconducting niobium near the vacuum boundary north, 20:17072 (IA;RU;In Russian)
Application of miniature magnetic induction converters for contactless testing of HTSC magnetic properties, 20:16088 (IA;RU;In Russian)
Autooscillations of normal zone in thin HTSC films with transport current, 20:16001 (IA;RU;In Russian)
Band structure and electronic properties of uniaxially strained quasi-unidimensional conductor m-TaS_3, 20:16107 (IA;RU;In Russian)
Behaviour of surface electrons over superfluid helium in magnetic field near the transition to Wigner crystal, 20:17139 (IA;RU;In Russian)
Behaviourof critical current in Bi-base superconducting wires under electron irradiation, 20:15935 (IA;RU;In Russian)
Calculation of mechano-thermal effect in superconductors, 20:15859 (IA;RU;In Russian)
Calorimetric and volt-ampere studies of $YBa_2Cu_3O_{6+\delta}$ behaviour in the temperature range of 300 to 420 K, 20:16000 (IA;RU;In Russian)
Calorimetric detection of two-dimensional atomic hydrogen by NMR-induced two-body recombination, 20:17130 (IA;RU;In Russian)
Collective oscillations in superconductors with nonmagnetic localized states, 20:17071 (IA;RU;In Russian)
Composite materials based on polyvinyl chloride and high temperature superconductors, 20:16090 (IA;RU;In Russian)
Compressiblity and phase transitions in $YBa_2Cu_3O_x$, 20:15933 (IA;RU;In Russian)
Conductivity of quasi-one-dimensional electron system over liquid helium, 20:17124 (IA;RU;In Russian)
Contribution of copper atoms to the phonon density in Y-Ba-Cu-O high-tc superconductor. Localization of Cu_2 atomic vibrations, 20:17079 (IA;RU;In Russian)
Contribution of superconducting parameter fluctuations to thermoemf of HTSC, 20:16013 (IA;RU;In Russian)
Critical state of $Nd_{1.85}Ce_{0.15}CuO_{4-\delta}$ thin films in a cross field, 20:15976 (IA;RU;In Russian)
Current noise and specific fetaures of current states in rigid superconductors, 20:15858 (IA;RU;In Russian)
Current passing pattern and low-frequency noise in YBaCuO films with B-oriented inclusions, 20:15937 (IA;RU;In Russian)
Dependence of charge-transfer gap on pressure in insulators - the analogues of high temperature superconductors, 20:15961 (IA;RU;In Russian)
Dependence of shielding currents and critical temperature on thickness of $YBa_2Cu_3O_{7-\delta}$ single crystals, 20:15970 (IA;RU;In Russian)
Depolarization, 20:17067 (IA;RU;In Russian)
Detection in HTSC-semiconductor contacts at high potential barriers, 20:17068 (IA;RU;In Russian)
Determination of bridge oxygen concentration in YBaCuO films, 20:15999 (IA;RU;In Russian)
Determination of conditions of Kondo-insulator CeNiSn base state formation, 20:15880 (IA;RU;In Russian)

Development of electromagnetic wave instability under current impulse on the metal action, 20:15884 (IA;RU;In Russian)
Dielectric resonance in $YBa_2Cu_3O_{7-x}$ specimens in UHF electromagnetic field, 20:15953 (IA;RU;In Russian)
Difficult tetra-ortho transition and temperature dependence of the London penentration depth in submicron $YBa_2Cu_3O_{6+x}$ particles produced according to Zol-Gel technology, 20:16004 (IA;RU;In Russian)
Dilatometry of $YBa_2Cu_3O_{6+x}$ in magnetic field, 20:15965 (IA;RU;In Russian)
Dissociation equilibrium line in HCP ^3He weak solutions in ^4He, 20:17132 (IA;RU;In Russian)
Dynamics of lattice and f-electron excitations in SmB_6, 20:16030 (IA;RU;In Russian)
Effect of γ-irradiation on element composition of $(Bi_{0.8}Pb_{0.2})_2Sr_2Ca_2Cu_3O_{10}$ HTSC surface, 20:15956 (IA;RU;In Russian)
Effect of electric field on phonons kinetics in virtual ferroelectrics at low temperatures, 20:16035 (IA;RU;In Russian)
Effect of electron-phonon interaction on the conductivity of Nb thin films, 20:15877 (IA;RU;In Russian)
Effect of exchange interaction on the energy spectrum of localized states in $p\text{-}Hg_{1-x-y}Cd_xMn_yTe$ alloys in magnetic field, 20:16103 (IA;RU;In Russian)
Effect of nearest surrounding on the formation of intervalent state in Ce-Ni compounds, 20:15872 (IA;RU;In Russian)
Elastic constants and magnetic susceptibility of monodomainized single crystals La_2CuO_{4+y}, 20:16020 (IA;RU;In Russian)
Electric and magnetic properties of semiconductors $Hg_{1-x}Mn_xTe_{1-y}Se_y$ at low temperatures, 20:15870 (IA;RU;In Russian)
Electric conductivity $t^{1/2}$ and $t^{1/4}$ relaxation in $YBa_2Cu_3O_{6+x}$ and $PrBa_2Cu_3O_{6+x}$ at various states of their oxygen subsystem, 20:15997 (IA;RU;In Russian)
Electrodynamic model of nonstationary josephson effect in small-size junctions, 20:17076 (IA;RU;In Russian)
Electron and phonon characteristics based on precision data on specific heat for $YBa_2Cu_3O_{7-\delta}$, 20:15936 (IA;RU;In Russian)
Electron paramagnetic resonance study of structural phase transformation in $Cs_2NaLaCl_6:Cd^{3+}$ crystal, 20:16098 (IA;RU;In Russian)
Electron scattering in modulated alloyed structure of multiple quantum pits on the basis of InGaAs/GaAs, 20:16105 (IA;RU;In Russian)
Electron-phonon mechanism in electric conductivity in high-T_c superconductors $Ba_{1-x}K_xBiO_3$, 20:17058 (IA;RU;In Russian)
Electron-photon interactions in HTSC-like ceramics $LaSrAl_{1-x}Me_xO_4$ ($Me = Ni^{3+}, Cu^{2+}$), 20:16024 (IA;RU;In Russian)
Electron-topological transition in Mo-Re, Mo-Re-Nb systems and its effect on T_k(c) dependence, 20:15851 (IA;RU;In Russian)
Equation for order parameter of superfluid Fermi liquid with triplet pairing near Tc in magnetic field, 20:17131 (IA;RU;In Russian)
Erbium and thulium antiferromagnetism - features of long-range and short-range order, 20:15866 (IA;RU;In Russian)
Evolution of transport and magnetic properties of granular $YBa_2Cu_3O_{7-\delta}$ superconductors at a decrease of Josephson binding, 20:15982 (IA;RU;In Russian)
Exactly solvable microscopic model of critical state in rigid superconductor, 20:17062 (IA;RU;In Russian)
Experimental studies of coherently pressing magnetization structure in ^3He-^4He liquid solutions, 20:17121 (IA;RU;In Russian)
Features of Andreev reflection in superconductor-semiconductor-superconductor structures, 20:17046 (IA;RU;In Russian)
Features of electrical properties of Ln-Ba-Cu-O and Ln-Sr-Nb-O (Ln = La, Nd, Gd, Dy, Tm, Lu) systems near by transition metal-dielectric, 20:16036 (IA;RU;In Russian)
Features of low temperature spin reorientation in dysprosium ortho-ferrite in H parallel b field, 20:16022 (IA;RU;In Russian)
Features of the condenser superconductivity at the presence of interband junctions, 20:17092 (IA;RU;In Russian)
Ferroelectric microdomain of oxygen vacancy in $YBa_2Cu_3O_{7-\delta}$, 20:15979 (IA;RU;In Russian)
Flicker noise of normal phase in $YBa_2Cu_3O_{7-\delta}$ films on various substrates, 20:15938 (IA;RU;In Russian)
Fluctuation conductivity of $Bi_2Sr_2CaCu_2O_x$ and $Bi_{1.8}Pb_{0.2}Sr_2CaCu_2O_x$ HTSC, 20:15986 (IA;RU;In Russian)
Fluctuation damping of magnons in ferromagnetic metals, 20:15874 (IA;RU;In Russian)
Fluctuation effects and upper critical field in HTSC, 20:15980 (IA;RU;In Russian)
Formation of 'low radius' bipolarous and thermodynamic properties of cuprate HTSC, 20:15932 (IA;RU;In Russian)
Formation of initial vortex structure in fine-grained HTSC, 20:15973 (IA;RU;In Russian)
Free He^4 crystal's face growth rate, 20:17140 (IA;RU;In Russian)
Frequency modulation method for observation of nonstationary Josephson effect in multiple weak-coupling system with random parameters, 20:17059 (IA;RU;In Russian)
Giant geometric oscillations of ultrasound absorption, 20:15878 (IA;RU;In Russian)
Giant magnetostriction in MTG specimens of YBaCuO superconducting state, 20:15990 (IA;RU;In Russian)
Growth and structure of $Bi_2Sr_2CaCu_2O_{8-x}$ epitaxial films on $SrTiO_3$ substrates with CeO_2 and MgO buffer layers, 20:15993 (IA;RU;In Russian)
Hall effect in the $Gd_{1-x}Pr_xBa_2Cu_3O_{7-y}$ system. Comparison with $Y_{1-x}Pr_xBa_2Cu_3O_{7-y}$, 20:15983 (IA;RU;In Russian)
Hedrodynamic fluctuations in superfluid helium in spatially bounded systems, 20:17123 (IA;RU;In Russian)
High-fequency conductivity of high temperarature superconductors, 20:15847 (IA;RU;In Russian)
High-T_c superconductors from the viewpoint of surface effects, 20:17073 (IA;RU;In Russian)
Homogeneous spin doping of copper planes in $Tl_2Ba_2Ca_2Cu_3O_{1-\delta}$ according to ^{63}Cu, ^{17}O, ^{205}Tl NMR data, 20:17077 (IA;RU;In Russian)
Hybridization contribution into crystal field in compounds $ReCu_2Si_2$ (Re - rare earths), 20:16034 (IA;RU;In Russian)
Impedance of high temperature superconductors in the vicinity of transition temperature in frequency range of 200 to 1000 MHz, 20:16008 (IA;RU;In Russian)
Impurity-stabilized solid helium, 20:17135 (IA;RU;In Russian)
Induced by deformation phase transition in thin samples o-TaS_3, 20:16108 (IA;RU;In Russian)
Influence of matrix composition on superconducting properties of SnTe base solid solutions alloyed with indium, 20:15958 (IA;RU;In Russian)
Influence of physical and chemical adsorption of H_2O molecules on phase state of $YBa_2Cu_3O_{7-\delta}$ HTSC, 20:15957 (IA;RU;In Russian)
Influence of Re electron spectrum fine structure on superconducting transition temperature T_k of Re-Mo and Re-Os alloys, 20:15966 (IA;RU;In Russian)
Influence of real structure and temperature on specific features of luminescence in $YBa_2Cu_3O_{7-\delta}$ HTSC, 20:15924 (IA;RU;In Russian)
Influence of twins and dislocations on critical current and pinning force in single crystal niobium, 20:15861 (IA;RU;In Russian)
Instability of magnetic flux in YBaCuO melt texture grown speeimens, 20:16015 (IA;RU;In Russian)
Inter-ion Auger-transitions and current carriers duration in narrow-zone p-type semiconductors with strong hole degeneration, 20:16104 (IA;RU;In Russian)
Interference of transport and shielding currents in $Bi_2Sr_2CaCu_2O_x$ single crystals, 20:15955 (IA;RU;In Russian)
Internal photoeffect and elastic properties of $Pb_{0.997}Ga_{0.003}Te$, 20:16102 (IA;RU;In Russian)
Interrelation between T_c and anisotropy of $La_{2-x}Sr_xCuO_4$ crystal lattice on radiation induced disordering, 20:15948 (IA;RU;In Russian)
Investigation by the NMR method of the critical state in superconductor $Tl_2Ba_2CuO_{6+\delta}$, 20:17080 (IA;RU;In Russian)
Investigation in the infrared spectroscopy range on the synchrotron radiation beam of HTSC film emission, 20:17088 (IA;RU;In Russian)
Investigation of the behaviour of superconducting Nb in a magnetic field by the polarized neutron transmission technique, 20:17048 (IA;RU;In Russian)

Investigation of the detecting response of superconducting structures on the frequency up to 2 THz, 20:17083 (IA;RU;In Russian)
Isotopic shift of T_c in LSCO with 3d-impurities, 20:15929 (IA;RU;In Russian)
Jump creep and interaction of magnetic vortices in inhomogeneous supreconductors, 20:17056 (IA;RU;In Russian)
Kinetic equations and temperature dependence of electric conductivity in HTSC normal phase, 20:15964 (IA;RU;In Russian)
Kinetics of oxygen sublattice ordering in $TmBa_2Cu_3O_{6.6}$ at room temperature, 20:15974 (IA;RU;In Russian)
Kinetics of plastic deformation of Ti-O solid solutions at temperatures 1 K ad below, 20:15868 (IA;RU;In Russian)
Krypton irradiation effect on pinning and creep in $Bi_2Sr_2CaCu_2O_x$ single crystals, 20:15963 (IA;RU;In Russian)
Laser spectroscopy of metastable $RG(^3P_{0,2})$ atoms in liquid and solid helium, 20:17134 (IA;RU;In Russian)
Lateral magnetoresistance of YBCO single crystals with various oxygen contents, 20:15927 (IA;RU;In Russian)
Liquid ^3He relaxation in confined geometry between dielectric crystals, 20:17127 (IA;RU;In Russian)
Localization effects and superconductivity in two-dimensional beryllium films, 20:15863 (IA;RU;In Russian)
Localized and low measuring phonons in multilayer crystals, 20:16023 (IA;RU;In Russian)
Logarithmic relaxation of electric conductivity related to a glass state of oxygen subsystem in bismuth HTSC, 20:15995 (IA;RU;In Russian)
Logarithmic relaxation of electric conductivity and phase transitions in now cluster chalcohenides $Re_{4-x}Mo_xS_4Te_4$, 20:15873 (IA;RU;In Russian)
Low temperature magnetic ordering in $YBa_2Cu_3O_{6.9}$ irradiated by fast neutrons, 20:15962 (IA;RU;In Russian)
Low temperature properties of $Nd(CCl_3COO)_32H_2O$ crystal with chain structure, 20:16091 (IA;RU;In Russian)
Low-frequency excitations in Nd_2CuO_4 and Pr_2CuO_4 oxides, 20:16987 (IA;RU;In Russian)
Low-frequency plasma oscillations in the phase slip centers, 20:17047 (IA;RU;In Russian)
Low-temperature conductivity and magnetic resistance of filament semiconductor crystals, 20:16101 (IA;RU;In Russian)
Magnetic and electric properties of new semimagnetic semiconductor $Hg_{1-x}Mn_xTe_{1-y}Se_y$, 20:16097 (IA;RU;In Russian)
Magnetic field penetration into powders from anisotropic superconductor, 20:15853 (IA;RU;In Russian)
Magnetic frustration contribution into susceptibility of rare earth isostructural analogs of high-temperature superconductors, 20:16025 (IA;RU;In Russian)
Magnetic penetration depth in $BaPb_{1-x}Bi_xO_3$ measured by μSR, 20:15856 (IA;RU)
Magnetic phase diagram of $YBa_2(Cu_{1-x}Fe_x)_3O_{6+y}$ superconductor in wide ranges of temperature and iron and oxygen contents, 20:15931 (IA;RU;In Russian)
Magnetic phase transformations in chain Ising's antiferromagnetic $CrEr(MoO_4)_2$, 20:16029 (IA;RU;In Russian)
Magnetic properties of amorphous $PrNi_5$, 20:16031 (IA;RU;In Russian)
Magnetic properties of dipole magnetic $CsGd(MoO_4)_2$ at low temperatures, 20:16019 (IA;RU;In Russian)
Magnetic properties of laminated superconductors with nodes in the excitation spectrum, 20:17049 (IA;RU;In Russian)
Magnetic shielding at liquid nitrogen temperatures, 20:15992 (IA;RU;In Russian)
Magnetoelastic anomalies and Moessbauer spectrum-peculiarities of holmium monocrystals in the range of magnetic phase transformations, 20:15864 (IA;RU;In Russian)
Magnetogeterogeneous state of structural phase transformations over magnetic field in holmium monocrystal, 20:15867 (IA;RU;In Russian)
Magnetoresistance anisotropy in single crystals of $YBa_2Cu_3O_x$ system in a normal state, 20:15926 (IA;RU;In Russian)
Magnetoresistance of YBCO in a normal state. Relation to superconducting properties, 20:15925 (IA;RU;In Russian)
Magnetostriction oscillations in manganese doped bismuth ceramics of 2223 type, 20:15951 (IA;RU;In Russian)
Mathematical modeling of radiation damage in HTSC materials, 20:15849 (IA;RU;In Russian)
Measurements of ongitudinal magnetic relaxation time in ^3He-^4He liquid solutions at ultralow temperatures, 20:17122 (IA;RU;In Russian)
Measuring of antiferromegnetic susceptibility of Ho^{+3} ions in $HoFeO_3$ on SNIM-2 spectrometer, 20:16021 (IA;RU;In Russian)
Model of topological generator (TG) on high-temperature superconductors, 20:17050 (IA;RU;In Russian)
Modeling of ^3He-^4He solid solution phase dissociation, 20:17128 (IA;RU;In Russian)
Modelling of low-temperature phases of solid C_{60}, 20:16100 (IA;RU;In Russian)
Multivalence of critical current of Josephson lattices, 20:15850 (IA;RU;In Russian)
Narrow lines of complex magnetic susceptibility in the vicinity of a frozen field in submicron particles of $YBa_2Cu_3O_{6+x}$ produced according to zol-gel technology, 20:16003 (IA;RU;In Russian)
Neutron depolarization in the rotating $YBa_2Cu_3O_{6.9}$, 20:17065 (IA;RU;In Russian)
Neutron-diffraction studies of the temperature dependence of $La_2CuO_{4.1}$ superconductor's dynamics, 20:17087 (IA;RU;In Russian)
New phase formation and growth in the process of stratification of ^3He-^4He superfluid solutions, 20:17120 (IA;RU;In Russian)
Nonequilibrium and bolometric response of YBaCuO films in a resistive state to infrared low intensity radiation, 20:15952 (IA;RU;In Russian)
Nonequilibrium phenomena is superconducting two-barrier Nb/Nb'/Nb, 20:15855 (IA;RU;In Russian)
Nonlinear electromagnetic waves in laminated conductors in quantizing magnetic field, 20:15883 (IA;RU;In Russian)
Nonlocal model of the critical state of hard superconductivity, 20:17055 (IA;RU;In Russian)
Nonmonotoneous changes of critical temperature in $(Bi_{0.8}Pb_{0.2})_2Ca_2Sr_2Cu_3O_{10}$ superconductor under low dose irradiation, 20:15930 (IA;RU;In Russian)
Nonstationary photoresponse of magnetic susceptibility of HTS Y-ceramics and Bi single crystals, 20:16011 (IA;RU;In Russian)
Nucleation centre density in concentrated phase at stratification of supersaturated superfluid ^3He-^4He solutions, 20:17125 (IA;RU;In Russian)
Nucleation rate at phase dissociation of superfluid ^3He-^4He solutions, 20:17126 (IA;RU;In Russian)
On the detonation mechanism of autowave phenomeno- in low temperature solid-phase processes, 20:16095 (IA;RU;In Russian)
On the existence of metallic and the Mott's type activation conductivity in metallic glasses, 20:15857 (IA;RU;In Russian)
On the instability of magnetic flux branching in superconductors, 20:17074 (IA;RU;In Russian)
Optical conductivity in HTSC-analysis of polaron contribution, 20:15967 (IA;RU;In Russian)
Optical properties of superconducting films of $YBa_2Cu_3O_{7-\delta}$, $Bi(Pb)Sr_2CaCu_2O_x$ and Te(Ba)CaCuO in visible and near infrared spectra, 20:16009 (IA;RU;In Russian)
Orbital glass, induced by 2D spin fluctuation in antiferromagnetics with Jahn-Teller ions (Eu_2CuO_4 and $EuMn_2O_5$), 20:16027 (IA;RU;In Russian)
Order and disorder in oxygen-deficient planes of $YBa_2Cu_3O_{6+x}$ and their relations to normal and superconductive properties, 20:16010 (IA;RU;In Russian)
Oscillations of transverse magnetoresistance in strong magnetic fields of intercalation compounds into graphite of acceptor type of the second step graphite, 20:16106 (IA;RU;In Russian)
Oxygen nonstoichiometry and dielectric properties of $YBa_2Cu_3O_{6+x}$, 20:15998 (IA;RU;In Russian)
Paramagnetic centers with the singlet ground state in planes CuO_2:NMR of Tm-169 in superconductor $TmBa_2Cu_3O_{6+x}$, 20:17052 (IA;RU;In Russian)
Paramagnetic Meisner effect in superconductors, 20:15987 (IA;RU;In Russian)
Partial factors of isotopic shifts for oxygen atoms in the 1-2-3 system, 20:17064 (IA;RU;In Russian)

Peak-effect in monocrystals and texturized $ReBa_2Cu_3O_y$ samples, 20:17066 (IA;RU;In Russian)
Phase diagram of oxygen ordering in $YBa_2Cu_3O_x$, 20:16006 (IA;RU;In Russian)
Phase transitions in the vortex system of a two-dimensional superconductor, 20:17084 (IA;RU;In Russian)
Phenomenological theory of phase transformations in C_{60} crystal, 20:16092 (IA;RU;In Russian)
Photoconductivity in $La_2CuO_{4+\delta}$ at metamagnetic transition, 20:16014 (IA;RU;In Russian)
Pinning effect of Abrikosov vortices on the dynamics of localized structures in type 2 superconductors in the mode of magnetic flux creep, 20:17075 (IA;RU;In Russian)
Polaron conductivity YBaCuO in dielectric phase, 20:17054 (IA;RU;In Russian)
Positronium in high-Tc superconductors, 20:17085 (IA;RU;In Russian)
Production and properties of large superconducting single crystals of $La_{2-x}Sr_xCuO_4$ and Nd_{2-}-xCe_xCuO_4, 20:15989 (IA;RU;In Russian)
Production of long-sized $Y_1Ba_2Cu_3O_{7-\delta}$ HTSC crystals and their properties, 20:15947 (IA;RU;In Russian)
Pulsed electron and ion irradiation effect on electrical properties of films of Y-Ba-Cu-O and Bi-Ca-Sr-Cu-O superconductors produced in a pulse ion diode, 20:15972 (IA;RU;In Russian)
Quantum corrections to the conductivity of charge carriers 2D-system with anisotropy spectrum in hydrostatic compression conditions (holes on tellurium (0001) surface), 20:15876 (IA;RU;In Russian)
Quasi-equilibrium relaxation in poorly-compensated impurity silicon conditioned by low-temperature recharging of impurities and defects, 20:17020 (IA;RU;In Russian)
Quasiclassic kinetic theory of giant magnetoresistance effect in metal magnetic superlattices, 20:15881 (IA;RU;In Russian)
Radiation effects in condensed films of cryocrystals, 20:16096 (IA;RU;In Russian)
Rubber-like composite materials based on polymers and YBaCu superconducting ceramics, 20:16089 (IA;RU;In Russian)
Search for new superconducting materials with the use of magnetically dependent microwave absorption, 20:15942 (IA;RU;In Russian)
Self-arranged critical state of Josephson lattices and granular superconductors, 20:17057 (IA;RU;In Russian)
Sensitive technique of studying fine superconducting structure of HTSC materials, 20:15969 (IA;RU;In Russian)
Shybniko-de Haas effect in inversion layers on the grain boundary of $Hg_{1-x}Cd_xTe$ bicrystals under uniaxial compression, 20:16960 (IA;RU;In Russian)
Size effect in thin metal oxide films as a test of coupling of superconducting pairing, 20:17070 (IA;RU;In Russian)
Some aspects of improving superconducting properties of Y-123 bulk single crystals, 20:15971 (IA;RU;In Russian)
Sound anomalous scattering from a face of a quantum crystal, 20:17141 (IA;RU;In Russian)
Specific features of nonlinear interaction of electromagnetic waves in rigid superconductors, 20:15934 (IA;RU;In Russian)
Specific features of tunneling in HTSC base structures, 20:16017 (IA;RU;In Russian)
Specific features of unidimensional N-S contact properties for superconductors with particle-hole violated symmetry, 20:15854 (IA;RU;In Russian)
Specific heat of specimens of YBCO-system with rare earth substitutions in a normal state range, 20:15985 (IA;RU;In Russian)
Stability of structure and properties of $YBa_2Cu_3O_{70x}$ thin epitaxial films under conditions of open space and earth atmosphere, 20:15988 (IA;RU;In Russian)
Stationary states and thermodynamical properties of ^3He-^4He solutions with the allowance for primeson iteraction, 20:17119 (IA;RU;In Russian)
Structural and bolometric properties of YBaCuO films on mica substrates, 20:16007 (IA;RU;In Russian)
Structural phase transition in $KEr(MoO_4)_2$, induced by external magnetic field, 20:16026 (IA;RU;In Russian)
Structure and magnetic properties of chromium complexes in SrF_2 crystals, 20:16094 (IA;RU;In Russian)
Study into the effect of calcium alloying on energy spectrum of $YBa_2Cu_3O_y$ by the complex method of electron transport phenomenon investigation, 20:15943 (IA;RU;In Russian)
Study of coefficient of thermo-emf in bismuth HTSC materials in the temperature range of T_c-1000 K, 20:15950 (IA;RU;In Russian)
Study of Cu-O structural fragments in HTSC and related phases, 20:16005 (IA;RU;In Russian)
Study of electron-phonon interaction duration in NbC films, 20:16033 (IA;RU;In Russian)
Study of exchange-binded pairs Ce^{3+}-Ce^{3+} in $Cs_2NaInCl_6$ crystal of elpasolite structure by electron paramagnetic resonance method, 20:16099 (IA;RU;In Russian)
Study of penetration depth of magnetic field in bismuth base HTSC by μSR method, 20:15960 (IA;RU;In Russian)
Study of physicotechnological bases of production of HTSC film structures, 20:15939 (IA;RU;In Russian)
Study of quasi-two-dimensional properties of Bi-2212 HTSC phase with the help of mutually perpendicular currents, 20:15944 (IA;RU;In Russian)
Study of $REBa_2(Cu_{1-x}Me_x)_3O_{7-y}$ (RE=Y, Gd; M=Ni, Fe) systems in superconducting and normal states, 20:15984 (IA;RU;In Russian)
Study of yttrium and mercury solubility and diffusion in $YBa_2Cu_3O_{7-\delta}$, 20:15940 (IA;RU;In Russian)
Study on the penetration of the rotating radio-frequency field into HTSC ceramics, 20:17089 (IA;RU;In Russian)
Study on the vortice lattice in $YBa_2Cu_3O_{7-\delta}$ monocrystals by the EPR-decoring, 20:17091 (IA;RU;In Russian)
Summaries of reports of the 30. Conference on low-temperature physics. Pt. 2. Quantum liquids and crystals. Low-temperature solid-state physics. Electron phenomena at low temperatures, 20:16018 (I;RU;In Russian)
Superconducting film in a perpendicular (constant and alternative) magnetic fields: state calculation and determination of field dependence of critical current, 20:16012 (IA;RU;In Russian)
Superconducting long-range order in a mixed state, 20:17086 (IA;RU;In Russian)
Superconducting phase formation on chemical deposition of HTSC coating, 20:15954 (IA;RU;In Russian)
Superconduction of electrons with spin correlation, 20:17090 (IA;RU;In Russian)
Superconductivity in structurally disordered system near quantum percolation transitions, 20:17069 (IA;RU;In Russian)
Superconductivity of carbon tungsten containing diamond-like films, 20:16087 (IA;RU;In Russian)
Superconductivity of helium doped epitaxial films of tin telluride, 20:15848 (IA;RU;In Russian)
Superconductivity of multipolaron system with strong electron correlation, 20:17078 (IA;RU;In Russian)
Superconductor-insulator transition induced by magnetic field in $Nd_{1.85}Ce_{0.15}CuO_4$ single crystal, 20:15994 (IA;RU;In Russian)
Surafce current relaxation in granulated HTSC, 20:16002 (IA;RU;In Russian)
Surface and internal magnetic solitons, induced by rare earth subsystem of ferrite garnets, 20:16028 (IA;RU;In Russian)
Surface electron fluctuations in metals and inelastic light scattering, 20:16961 (IA;RU;In Russian)
Surface impedance of type-ii superconductor in a mixed state and the Bin-Livingston barrier, 20:15860 (IA;RU;In Russian)
Synthesis, crystal structure and inelastic scattering of neutrons in $Sr_{1-x}Nd_xCuO_2$ infinite superconductors, 20:15991 (IA;RU;In Russian)
T^2 dependence of electric conductivity in the range of $500 < T < 1000$ K for bismuth HTSC being related to the mobility of oxygen subsystem, 20:15996 (IA;RU;In Russian)
Temperature and field dependences of internal friction and shear modulus of bismuth ceramics, 20:16016 (IA;RU;In Russian)
Temperature dependence of diffusion flow of ^3He BCC crystals of low density, 20:17136 (IA;RU;In Russian)
Temperature dependence of normal resistance of HTSC Josephson junction on bicrystal substate, 20:16032 (IA;RU;In Russian)

The absence of Abrikosov vortex state transition in two-dimensional type-ii superconductors with weak pinning effect, 20:17081 (IA;RU;In Russian)
The electric field induced by a longitudinal sound wave in inhomogeneous superconductors, 20:17063 (IA;RU;In Russian)
The first and the second critical fields in fast neutron $YBa_2Cu_3O_x$ and $NbSe_2$, 20:15968 (IA;RU;In Russian)
The fishtail in superconductors with coarse inclusions of normal phase, 20:15852 (IA;RU;In Russian)
The line of irreversibility and dissipative losses in YBCO epitaxial film, 20:15959 (IA;RU;In Russian)
The role of boundary conditions in peculiar properties of two-dimensional electron gas. (Quantum Hall effect), 20:15879 (IA;RU;In Russian)
Thermal boundary resistance of YBaCuO film on MgO and sapphire substrates, 20:15977 (IA;RU;In Russian)
Thermal conductivity of pressed fullerene C^{60} samples, 20:16093 (IA;RU;In Russian)
Thermodynamics of Josephson system in a strong magnetic field, 20:17061 (IA;RU;In Russian)
Thick films of $YBa_2Cu_3O_{7-\delta}$ produced on Y_2BaCuO_5 substrate by painting: technology, properties, applications, 20:15949 (IA;RU;In Russian)
Thin superconducting YBaCuO in strong microwave field, 20:17051 (IA;RU;In Russian)
Threshold variation of chemical composition and surface morphology in $(Pb_xBi_{1-x})_2Sr_2Ca_2Cu_3O_y$ ceramics under electron irradiation, 20:15941 (IA;RU;In Russian)
Transformation of excitation spectra of 4f electrons in $Ce_{1-x}La_xNi$ compounds, 20:15882 (IA;RU;In Russian)
Transport properties of superconducting single crystal filaments in a glass shell, 20:15928 (IA;RU;In Russian)
Tunnel characteristics of the normal metal-insulator-HTSC structure in the layer model, 20:17094 (IA;RU;In Russian)
Two-dimensional periodic deformation structures of superlattice type on the charged surface of fluid helium, 20:17129 (IA;RU;In Russian)
Ultrahigh ferromagnetic properties of hydroextruded dysprosium, 20:15871 (IA;RU;In Russian)
Ultrasound reflection in neighborhood of superlattice resonances, 20:15875 (IA;RU;In Russian)
Unfluence of head treatment conditions on pinning force in Nb-22Ta-37Ti superconductor, 20:15862 (IA;RU;In Russian)
Vacancy kinetics in ^4He crystals, 20:17137 (IA;RU;In Russian)
Variation wave function in Hubbard model, 20:17053 (IA;RU;In Russian)
Variations of magnetic flux relation rate in Y-Ba-Cu-O film under crossed electric field effect, 20:15981 (IA;RU;In Russian)
Volt-ampere characteristics of the tunnel HTSC-insulator-HTSC structure in the layer model, 20:17093 (IA;RU;In Russian)
Volt-ampere characteristics of YBaCuO epitaxial films in the range of superconducting transition, 20:15945 (IA;RU;In Russian)
Vorties in rotating helium II in rings of arbitrary size, 20:17138 (IA;RU;In Russian)

Summary of applications of TOUGH2 to the evaluation of multiphase flow processes at the WIPP, 20:15038 (R;US)
Summary of the energy efficient, waste-reducing technology assessment conducted for DOE and EPAct 2108, 20:15666 (R;US)
Summary report for the viability of asynchronous transfer mode (ATM) in local area network (LAN) environments Laboratory Directed Research and Development Project, 20:17435 (R;US)
Synthesis of novel precursors for PMN powders and the thin films obtained from them, 20:16047 (R;US)
Target diagnostics for intense lithium ion hohlraum experiments on PBFA II, 20:17263 (R;US)
The BR3 vessel anneal: Lessons and perspective, 20:15413 (RA;US)
The development and application of massively parallel solid mechanics codes, 20:16755 (R;US)
The dynamic response of a weapon's internal components to a high speed impact, 20:16471 (R;US)
The effect of stratigraphic dip on multiphase flow at the Waste Isolation Pilot Plant, 20:15036 (R;US)
The impact of technology on the economy, 20:15642 (R;US)
The influence of crushed rock salt particle gradation on compaction, 20:15031 (R;US)

The pyrochlore-to-perovskite transformation in solution-derived lead zirconate titanate thin films, 20:16049 (R;US)
The role of advanced engineering simulation in model-based design, 20:17387 (R;US)
The role of dynamic experimentation for computation analysis, 20:15892 (R;US)
The US Nuclear Regulatory Commission's HSSI program annealing and reembrittlement studies at ORNL, 20:15419 (RA;US)
The use of low energy, ion induced nuclear reactions for proton radiotherapy applications, 20:16612 (R;US)
Thermal measurements to characterize large fires, 20:16277 (R;US)
Thermal testing of packages for transport of radioactive wastes, 20:16273 (R;US)
Toward a risk-based approach to the assessment of the surety of information systems, 20:17388 (R;US)
Treatment of uncertainties in risk-based regulation, 20:17383 (R;US)
Using TOUGH2 to model the coupled effects of gas generation, repository consolidation, and multiphase brine and gas flow at the Waste Isolation Pilot Plant, 20:15035 (R;US)
Velocity boundary conditions for vorticity formulations of the incompressible Navier-Stokes equations, 20:16292 (R;US)
Vibration control for precision manufacturing at Sandia National Laboratories, 20:15797 (R;US)
Viscous diffusion of vorticity in unsteady wall layers using the diffusion velocity concept, 20:16293 (R;US)
Winter season air pollution in El Paso-Ciudad Juarez. A review of air pollution studies in an international airshed, 20:16507 (R;US)
Workshop on transport for a common ion driver, 20:17264 (R;US)

Sandia National Labs., Livermore, CA (United States)
4,4′-Methylene Dianiline (MDA) and thermal abuse of Rigid Polyurethane Foam, 20:16278 (R;US)
A modification to the GMRES method for ill-conditioned linear systems, 20:17396 (R;US)
A Stochastic EM algorithm for approximating the maximum likelihood estimate, 20:17392 (R;US)
An investigation of a novel approach to elemental imaging in three dimensions, 20:16174 (R;US)
Effects of gas-phase thermal expansion on the stability of deflagration through a porous energetic material, 20:16254 (R;US)
NaK pool-boiler solar receiver durability bench test. Volume 2, Metallurgical analysis, 20:15305 (R;US)
Video conferencing using DAVE user's guide, 20:17394 (R;US)

Santa Catarina Univ., Florianopolis, SC (Brazil). Programa de Mestrado em Sociologia Politica
Nucleoelectric energy dilemma in Brazil in the 1980's, 20:15683 (I;BR;In Portuguese)

Santa Fe Inst., NM (United States)
1993 Annual report on scientific programs: A broad research program on the sciences of complexity, 20:16598 (R;US)
A broad research program on the sciences of complexity. Final report, 20:16597 (R;US)

Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica
Electret ionization chamber: a new method for detection and dosimetry of thermal neutrons, 20:16408 (I;BR;In Portuguese)

Review of geochronological context of basic dikes from Para de Minas, Esmeraldas, Minas Gerais State, Brazil, 20:16131 (I;BR;In Portuguese)

Science Applications International Corp., Las Vegas, NV (United States)
Applications of natural analogue studies to Yucca Mountain as a potential high level radioactive waste repository, 20:14983 (R;US)

Science Applications International Corp., McLean, VA (United States)
Guidelines for the verification and validation of expert system software and conventional software: Project summary. Volume 1, 20:15572 (R;US)
Guidelines for the verification and validation of expert system software and conventional software: Survey and assessment of conventional software verification and validation methods. Volume 2, 20:15573 (R;US)
Guidelines for the verification and validation of expert system software and conventional software: Survey and documentation of expert system verification and validation methodologies. Volume 3, 20:15574 (R;US)
Guidelines for the verification and validation of expert system software and conventional software: Evaluation of knowledge base certification methods. Volume 4, 20:15575 (R;US)
Guidelines for the verification and validation of expert system software and conventional software: Rationale and description of V&V guideline packages and procedures. Volume 5, 20:15576 (R;US)
Guidelines for the verification and validation of expert system software and conventional software: Validation scenarios. Volume 6, 20:15577 (R;US)
Guidelines for the verification and validation of expert system software and conventional software: User's manual. Volume 7, 20:15578 (R;US)
Guidelines for the verification and validation of expert system software and conventional software: Bibliography. Volume 8, 20:15579 (R;US)

Science Applications International Corp., McLean, VA (United States). Foreign Applied Sciences Assessment Center
Non-US electrodynamic launchers research and development, 20:16455 (R;US)

Science Applications International Corp., Oak Ridge, TN (United States)
Decision document for performing a long-term pumping test at the S-3 Site, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, 20:15204 (R;US)
Fiscal year 1994 well installation program summary report, Y-12 Plant, Oak Ridge, Tennessee, 20:15157 (R;US)
Underground storage tank management plan, 20:15135 (R;US)
Wet season reconnaissance report on Seeps and Springs in Waste Area Grouping 6 at Oak Ridge National Laboratory. Environmental Restoration Program, 20:15010 (R;US)

Selected Electronic Technologies GmbH (SET), Wedel (Germany)
System-adapted electronic devices (SAGE). Final report, 20:15752 (R;DE;In German)

Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Bereich Energieerzeugung
NO_x and dioxin abatement by SCR catalysts, 20:16493 (I;DE)
UPTF test instrumentation. Measurement system identification, engineering units and computed parameters, 20:15610 (I;DE)
UPTF-TRAM test A2. Formation of stratified flow in the hot leg, 20:15609 (R;DE;In German)
UPTF-TRAM test A3. Turn-over of the hot-leg injected ECC in the steam generator direction, 20:15611 (R;DE;In German)

Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Werkstoffe und Chemie
UPTF-TRAM test A2. Formation of stratified flow in the hot leg, 20:15609 (R;DE;In German)
UPTF-TRAM test A3. Turn-over of the hot-leg injected ECC in the steam generator direction, 20:15611 (R;DE;In German)

Siemens Solar Industries, Camarillo, CA (United States)
Photovoltaic Czochralski silicon manufacturing technology improvements. Annual subcontract report, 1 April 1993–31 March 1994, 20:15293 (R;US)

Slagteriernes Forskningsinstitut, Roskilde (Denmark)
Branch analysis of energy for slaughterhouses. Main report, 20:15786 (R;DK;In Danish)
Branch analysis of energy for slaughterhouses. Working report. Iversen-Dane Beef. Bylderup Bov department, 20:15787 (R;DK;In Danish)
Branch analysis of energy for slaughterhouses. Working report. Tulip International A/S. Minced meat division, 20:15788 (R;DK;In Danish)
Branch analysis of energy for slaughterhouses. Working report. Slagteri Syd. Blans dept, 20:15789 (R;DK;In Danish)

Slovenskych Matematikov a Fyzikov, Bratislava (Slovakia). Fyzikalna Vedecka Sekcia
0.9 MV accelerator for materials research at the Slovak Technical University, Bratislava, 20:16346 (IA;CZ)
Calculation of correlation dimension of plasma density fluctuations in CASTOR tokamak, 20:17173 (IA;CZ;In Czech)

Characteristics of neutron-irradiated silicon, 20:16084 (IA;CZ;In Slovak)
Characteristics of z-pinch plasma implosion, 20:17171 (IA;CZ;In Czech)
Determination of light elements in materials using the coincidence method, 20:16144 (IA;CZ;In Czech)
FMR study into changes of magnetic properties of amorphous alloy FeNiCrMoSiB after neutron irradiation, 20:16083 (IA;CZ;In Slovak)
Fragmentation of ^{197}Au nuclei in emulsion at 10.7 GeV/nucleon, 20:16831 (IA;CZ;In Slovak)
Moessbauer spectrometer on PC-AT, 20:16410 (IA;CZ;In Czech)
Moessbauer spectroscopy in quasicrystals, 20:16976 (IA;CZ;In Slovak)
Nuclear analytical methods at the Institute of Nuclear Physics, Czech Academy of Sciences, 20:16146 (IA;CZ;In Czech)
Nuclear interactions of ^{28}Si ions in emulsion at 14.6 AGeV, 20:16830 (IA;CZ;In Slovak)
Phase analysis by Moessbauer spectroscopy, 20:16975 (IA;CZ;In Slovak)
Plasma diagnostics by holographic interferometry, 20:17177 (IA;CZ;In Czech)
Plasma relaxation in flowing afterglow at medium pressures, 20:17175 (IA;CZ;In Czech)
Proceedings of the 11. conference of Czech and Slovak physicists, 20:17312 (I;CZ;In Czech, Slovak, English)
Pulsed and CW NMR study of drawn polypropylene fibres, 20:16977 (IA;CZ)
Quality control of air using nuclear analytical methods, 20:16145 (IA;CZ;In Czech)
Radiation capture of thermal neutrons in ^{124}Te, 20:16889 (IA;CZ;In Czech)
Reflectometry at CASTOR tokamak, 20:17172 (IA;CZ;In Czech)
Search for massive neutrinos in beta decay, 20:16846 (IA;CZ;In Czech)
Study of ^{124}Te(n,γ)^{125}Te reaction with thermal neutrons, 20:16888 (IA;CZ;In Czech)
Study of boundary plasma in CASTOR tokamak, 20:17176 (IA;CZ;In Czech)
Study of iron sulfides in coal using Moessbauer spectroscopy, 20:16147 (IA;CZ;In Czech)
Study of Mars surface using Moessbauer spectroscopy, 20:16143 (IA;CZ)
Three-axis neutron diffractometer for study of residual stresses in polycrystalline materials, 20:16409 (IA;CZ;In Czech)
Tomography at CASTOR tokamak, 20:17174 (IA;CZ;In Czech)

Sociedade Brasileira de Geofisica, Rio de Janeiro, RJ (Brazil)
On the use of thin natural uranium film dosimetry in mineral dating by the fission track method, 20:16138 (I;BR)

Sociedade Brasileira de Geologia, Belem, PA (Brazil). Nucleo Norte
A discussion about the ortho gneisses source from Araguaia Belt basement based in Sr and Nd isotopes, 20:16134 (I;BR;In Portuguese)
Comparative study between geochronological methods used in zircons; the case of Maria River granodiorite, Carajas Province - Brazil, 20:16133 (I;BR;In Portuguese)
Geochemistry, petrogenesis and Rb-Sr geochronology from Uaupes River Granite: implication for the evolution of Negro River Province, Amazon, 20:16136 (I;BR;In Portuguese)
Geochronology from Carajas Mineral Province; data synthesis and new challenges, 20:16132 (I;BR;In Portuguese)
Pb/Pb geochronology in zircon from Cumaru granodiorite, Gradaus Sierra, Para State, Brazil, 20:16135 (I;BR;In Portuguese)

Solar Turbines, Inc., San Diego, CA (United States)
Advanced turbine systems program conceptual design and product development. Annual report, August 1993–July 1994, 20:15369 (R;US)

Solarex Corp., Frederick, MD (United States)
Cast polycrystalline silicon photovoltaic module manufacturing technology improvements. Semiannual subcontract report, 8 December 1993–30 June 1994, 20:15292 (R;US)

Solarex Corp., Newtown, PA (United States). Thin Film Div.
Large-area, triple-junction a-Si alloy production scale-up. Semiannual subcontract report, 17 March 1994–18 September 1994, 20:15294 (R;US)

Solenergiudvalget (Denmark)
Plan of action for solar energy 1995-97, 20:15718 (R;DK;In Danish)

Soltan Inst. for Nuclear Studies, Otwock-Swierk (Poland)
LEP and results obtained by DELPHI after four years of operation, 20:16841 (R;PL;In Polish)
Model calculations of ^{111}In production via the ^{112,114,115,116,117}Sn(^{1}H, xnypzα)^{111}Sb $\rightarrow$ ^{111}Sn $\rightarrow$ ^{111}In reactions, 20:16250 (R;PL)
Radiation hardness of some semiconductor devices produced in Poland to fast neutrons. Pt. 1. Diodes and transistors, 20:16439 (R;PL;In Polish)
Radiation hardness of some semiconductor devices produced in Poland to fast neutrons. Pt. 2. Integrated circuits, 20:16440 (R;PL;In Polish)
Systematic study of L-shell ionization of some heavy elements by light ion bombardment, 20:16948 (R;PL)
The influence of upstream material on the performance of an electromagnetic calorimeter inside a magnetic field, 20:16433 (R;PL)
The Monte Carlo event generator for modelling the coherence and chaos in high energy hadronic and nuclear collisions, 20:17397 (R;PL)

Sorbent Technologies Corp., Twinsburg, OH (United States)
Direct sulfur recovery during sorbent regeneration. Final report, 20:14763 (R;US)

Southern Co. Services, Inc., Birmingham, AL (United States)
Hot Gas Cleanup Test Facility for gasification and pressurized combustion. Quarterly report, October–December 1994, 20:14718 (R;US)

Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory Analyses
Field site investigation: Effect of mine seismicity on groundwater hydrology, 20:15008 (R;US)

Stanford Linear Accelerator Center, Menlo Park, CA (United States)
A search for jet handedness in hadronic Z^0 decays, 20:16843 (R;US)
Notes on lie algebraic analysis of achromats, 20:16364 (R;US)
RF pulse compression for future linear colliders, 20:16388 (R;US)
Spin structure in high energy processes: Proceedings, 20:16781 (R;US)
Studies of the strong and electroweak interactions at the Z_0 pole, 20:16842 (R;US)

Stanford Univ., CA (United States)
Scale-up of miscible flood processes for heterogeneous reservoirs. Quarterly report, July 1, 1994–September 30, 1994, 20:14819 (R;US)

Stanford Univ., CA (United States). Dept. of Petroleum Engineering
Scale-up miscible flood processes for heterogeneous reservoirs. Quarterly report, 1 October–31 December 1994, 20:14820 (R;US)

State Univ. of New York, Stony Brook, NY (United States). Dept. of Applied Mathematics and Statistics
Fifth international conference on hyperbolic problems -- theory, numerics, applications: Abstracts, 20:17324 (R;US)

Statens Byggeforskningsinstitut, Hoersholm (Denmark)
Glass in the building envelope - a review, 20:16119 (R;DK;In Danish)

Statens Husdyrbrugsforsoeg, Horsens (Denmark). Afd. for Jordbrugsteknik
Smoke cleaning in small straw boilers. Venturi scrubber, 20:16509 (R;DK;In Danish)

Waste Characterization Facility at the Idaho National Engineering Laboratory. Environmental Assessment, 20:14966 (R;US)

USDOE Morgantown Energy Technology Center, WV (United States)
Achieving improved cycle efficiency via pressure gain combustors, 20:15804 (R;US)
Combustion oscillation control by cyclic fuel injection, 20:16300 (R;US)
Hot gas particulate cleanup for advanced coal-based power systems, 20:14725 (R;US)
METC Combustion Research Facility, 20:16299 (R;US)
Solid oxide fuel cell commercialization in the United States, 20:15730 (R;US)

USDOE Nevada Field Office, Las Vegas, NV (United States)
A case study on determining air monitoring requirements in a radioactive materials handling area, 20:16652 (RA;US)
A defense programs training initiative in the area of radiological control, 20:16643 (RA;US)
A DOE/NRC dosimetry intercomparison study, 20:16628 (RA;US)
A method, using ICRP 26 weighting factors, to determine effective dose equivalent due to nonuniform external exposures, 20:16625 (RA;US)
Alternative concepts for design of air monitoring instruments: In-line and open face reference samplers and a new method of demonstrating alpha CAM performance, 20:16656 (RA;US)
Article 511 or a section 8 - which makes more sense?, 20:16626 (RA;US)
Beta/gamma test problems for ITS, 20:16637 (RA;US)
BNL ALARA center's development of a computerized Radiological Assessment and Design System (RADS), 20:16660 (RA;US)
Calibration and operation of continuous air monitors for alpha-emitting radionuclides, 20:16654 (RA;US)
CAM correlation to fixed air sample data at Los Alamos National Laboratory, 20:16657 (RA;US)
Categorization of worker bioassay programs based on intake potential, 20:16648 (RA;US)
Containment development at Paducah Gaseous Diffusion Plant, 20:14958 (RA;US)
Current and future health physics research at Lawrence Livermore National Laboratory, 20:16630 (RA;US)
Development and implementation of a radiological worker training program for an architect/engineer contractor, 20:16642 (RA;US)
Development and implementation of a new radiation exposure record system, 20:16651 (RA;US)
Development of an external dosimetry technical basis manual, 20:16624 (RA;US)
Dissolution rate and radiation dosimetry of metal tritides, 20:16661 (RA;US)
DOE radiological control manual implementation strategy at the Savannah River Site, 20:16631 (RA;US)
DOE Radiological Control Manual Core Training Program, 20:16641 (RA;US)
Dose variables to serve radiation protection and epidemiologic needs, 20:16650 (RA;US)
Evaluation of an intake of plutonium 238: A case history, 20:16645 (RA;US)
Evaluation results of various commercial air monitors for use at the Oak Ridge National Laboratory, 20:16655 (RA;US)
Formation of an environmental restoration user group for radiological controls, 20:16629 (RA;US)
Hanford Site Radiological Control Manual, 20:16633 (RA;US)
Implementation of the new DOE Radiological Control Manual, 20:16632 (RA;US)
Internal dosimetry and lifetime dose control-impacts of the U.S. Department of Energy Radiological Control Manual, 20:16647 (RA;US)
ISO standards on the evaluation of contamination, 20:16640 (RA;US)
Los Alamos Mobile Radiological Laboratory fielded during post shot drilling operations at the Nevada Test Site, 20:16394 (RA;US)
Mixed waste removal from a hazardous waste storage tank, 20:14959 (RA;US)
New approaches to instrumentation and calibration, 20:16639 (RA;US)
Off-site contamination at Oak Ridge National Laboratory, 20:16658 (RA;US)
PC edit package for testing of annual radiation dose summary data, 20:16649 (RA;US)
Personnel dose assignment practices, 20:16644 (RA;US)
Plutonium bioassay by inductively coupled plasma mass spectrometry (ICP/MS), 20:16646 (RA;US)
Post-training evaluation program for radiological worker training, 20:16623 (RA;US)
Program enhancements resulting from the off-site contamination event, 20:16659 (RA;US)
Progress update at Weldon Spring; focus on buildings demolition, 20:15167 (RA;US)
Radiological control implementation guide, 20:16634 (RA;US)
Radiological control technician implementing continuing training, 20:16622 (RA;US)
Radiological evaluation program by the Office of Nuclear Safety, 20:16635 (RA;US)
Radiological hazard classification of DOE facilities by DOE STD-1027-92: LANL nuclear facility list, 20:15168 (RA;US)
Radiological worker II training implementing practical exercise training, 20:16621 (RA;US)
Research in extremity dosimetry and contamination measurements, 20:16662 (RA;US)
Tank 241-CX-70 waste removal and packaging, 20:14960 (RA;US)

Technical basis and evaluation criteria for an air sampling/monitoring program, 20:16653 (RA;US)
The DOE in-vivo phantom library program, 20:16627 (RA;US)
The Martin Marietta Energy Systems Associated Laboratories for Excellence in Radiation Technology (ALERT), 20:16636 (RA;US)

Directory of potential subcontracting opportunities at Headquarters Procurement Operations, 20:17286 (R;US)

USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States)
Yucca Mountain Site Characterization Project Bibliography, January–June 1993. An update: Supplement 4, Addendum 1, 20:14973 (R;US)

USDOE Pittsburgh Energy Technology Center, PA (United States)
Engineering development of advanced physical fine coal cleaning for premium fuel applications. Quarterly technical progress report 9, October 1, 1994–December 31, 1994, 20:14710 (R;US)
Method for selective dehalogenation of halogenated polyaromatic compounds, 20:16194 (PA;US)

USDOE Richland Operations Office, WA (United States)
100-BC-2 limited field investigation report, 20:14977 (R;US)
Hanford Site waste management units report. Revision 4, Volume 1, 20:14974 (R;US)
Hanford Site waste management units report: Sample and data management. Revision 4, Volume 2, 20:14975 (R;US)
Limited field investigation report for the 100-NR-2 Operable Unit, Hanford Site, Richland, Washington, 20:15143 (R;US)
Limited field investigation report for the 100-BC-2 Operable Unit, 20:15173 (R;US)
Limited field investigation report for the 100-HR-2 Operable Unit, 20:15174 (R;US)
Proposed plan for the Environmental Restoration Disposal Facility (ERDF) at the Hanford Site, Richland, Washington. Revision 1, 20:14978 (R;US)
Risk evaluation of remedial alternatives for the Hanford Site, 20:15172 (R;US)

USDOE Rocky Flats Office, Golden, CO (United States)
Potassium ferrate treatment of RFETS' contaminated groundwater, 20:15183 (R;US)

USDOE Savannah River Operations Office, Aiken, SC (United States)
Environmental assessment for the upgrade of the site road infrastructure on the Savannah River Site, 20:15648 (R;US)

USDOE Southwestern Power Administration, Tulsa, OK (United States)
The energy behind the power. Southwestern Power Administration 1994 annual report, 20:15711 (R;US)

USDOE, Washington, DC (United States)
Development of DOE lessons learned programs, 20:17288 (R;US)
Table-top training program design, 20:17285 (R;US)

Utah Univ., Salt Lake City, UT (United States)
Characterization of multiphase fluid flow during air-sparged hydrocyclone flotation by x-ray CT. Final report, 14 August 1990–13 August 1994, 20:14708 (R;US)

Utah Univ., Salt Lake City, UT (United States). Dept. of Chemical Engineering
Three-dimensional turbulent particle dispersion submodel development. Final report, 15 April 1991–15 April 1993, 20:16301 (R;US)

V

Vejdirektoraet, Copenhgaen (Denmark)
Air quality in the streets of Denmark. Calculations related to 34 streets, 20:16501 (R;DK;In Danish)

VFL Technology Corp., Malvern, PA (United States)
Final report from VFL technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC Appendices, Volume 2, Appendix V-A, 20:15154 (R;US)
Final report from VFL Technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC Appendices, Volume 3, Appendix V-B, 20:15199 (R;US)

Vienna Univ. (Austria). Inst. fuer Radiumforschung und Kernphysik
A device for checking the automatic exposure control in mammography, 20:16674 (RA;AT)
A program for control and analysis of counting experiments, 20:17352 (RA;AT)
Activation cross-section measurements for the reactions $^{58}Ni(n,p)^{58}Co$ and $^{93}Nb(n,2n)^{92m}Nb$ in the 5-13 MeV energy region, 20:16895 (RA;AT)
An electrometer amplifier for ionization chamber measurements, 20:16413 (RA;AT)
Application of nuclear methods for paleoclimatological studies of loess formations at Stiefern, Lower Austria, 20:16414 (RA;AT)
Calculation of gamma-ray spectra with given multiplicity, 20:16927 (RA;AT)
Contributions to fundamentals of particle counting applied to radioactivity measurements, 20:16412 (RA;AT)
Detailed study of uncertainties and correlations in the neutron nuclear data of ^{52}Cr, ^{56}Fe, ^{58}Ni and ^{60}Ni for the European fusion file, 20:16899 (RA;AT)
Detailed study of uncertainties and correlations in the neutron nuclear data of ^{52}Cr, ^{56}Fe, ^{58}Ni and ^{60}Ni for the European Fusion File, 20:16910 (RA;AT)
Determination of the $^{60}Ni(n,2n)^{59}Ni$ cross section using accelerator mass spectroscopy, 20:16890 (RA;AT)
Distribution of radiative strength in ^{156}Gd, ^{157}Gd and ^{158}Gd nuclei, 20:16867 (RA;AT)
Electromagnetic properties of quasiparticles in a relativistic many-body theory, 20:16847 (RA;AT)
Evaluation of 14 MeV cross sections for the main isotopes of the structural materials Cr, Fe and Ni, 20:16900 (RA;AT)
Evaluation of angle-integrated neutron-emission cross sections from the interaction of 14MeV neutrons with medium-mass and heavy nuclei, 20:16909 (RA;AT)
Institute for Radiation Research and Nuclear Physics. Progress report 1990, 20:16854 (R;AT)
Institute for Radiation Research and Nuclear Physics. Progress report 1991, 20:16855 (R;AT)
Investigation of (α,xn)- and $(\alpha,\alpha xn)$ reactions for $\alpha + {}^{107,109}Ag$ at incident energies between 20 and 60 MeV, 20:16897 (RA;AT)

Investigation of (n,xnγ) reactions on lead isotopes for neutron energies up to 100 MeV, 20:16904 (RA;AT)
Investigation of the E1 gamma-ray strength in deformed nuclei, 20:16866 (RA;AT)
Investigation of the spallation products from the interaction of 800 MeV protons with aluminium, 20:16848 (RA;AT)
Investigations of (n,xnγ) reactions on lead isotopes for neutron energies up to 100 MeV, 20:16891 (RA;AT)
IRK evaluations of neutron-dosimetry reactions, 20:16898 (RA;AT)
Isolation of uranium and thorium from pure carbonate speleothems for uranium-series age determination, 20:16153 (RA;AT)
Isotopic fractionation and radon leakage in loess formations at Stiefern, Lower Austria, 20:16551 (RA;AT)
Lyoluminescence of sugar for a possible application in accident dosimetry, 20:16673 (RA;AT)
Lyoluminescence of sugar for a possible application in accident dosimetry, 20:16675 (RA;AT)
Measurement of neutron-induced fission cross sections for ^{206}Pb and ^{208}Pb, 20:16892 (RA;AT)
Measurement of neutron-induced fission cross sections for ^{206}Pb and ^{208}Pb, 20:16905 (RA;AT)
Measurement of the ^{23}Na(n,2n)^{22}Na cross section at E_n=19.45 MeV and re-evaluation of the ^{23}Na(n,2n)^{22}Na excitation function, 20:16896 (RA;AT)
Measurement of the ^{60}Ni(n,p)^{60}Co cross section in the neutron energy range 6-13 MeV, 20:16894 (RA;AT)
Measurement of the activation cross section for the reaction ^{93}Nb(n,n')^{93m}Nb in the energy range 6-9 MeV, 20:16903 (RA;AT)
Methods for the localization of ^{106}Ru-applicators in radiation therapy of choroidal melanoma, 20:16611 (RA;AT)
Model calculations of ^{48,50}Ti(n,αγ) activation cross sections, 20:16868 (RA;AT)
NPROD-a program for calculation of neutron yields and spectra on a PC, 20:17351 (RA;AT)
Nuclear matter at finite temperature and density, 20:16861 (RA;AT)
Nuclear matter at high densities and temperatures, 20:16860 (RA;AT)
Nuclear-model calculations of cross sections of neutron-induced reactions on ^{23}Na up to 20 MeV, 20:16902 (RA;AT)
Preparation of the measurement of double differential neutron-scattering cross sections at 14.1 MeV using the neutron generator of the IRK, 20:16928 (RA;AT)
Prerequisites for accurate activation cross-section measurements, 20:16907 (RA;AT)
Radiocarbon dating laboratory, 20:16151 (RA;AT)
Radiocarbon dating laboratory, 20:16154 (RA;AT)
Radiography of watermarks in medieval papers with soft X-rays, 20:16150 (RA;AT)
Radon measurements for earthquake-prediction research, 20:16549 (RA;AT)
Radon measurements for earthquake prediction research, 20:16550 (RA;AT)
Stable isotope investigations, 20:16149 (RA;AT)
The ^{238}U(n,f) cross section and its ratio to the ^{27}Al(n,α)^{24}Na and ^{56}Fe(n,p)^{56}Mn cross section in the 14 MeV region, 20:16893 (RA;AT)
The ^{238}U(n,f) cross section and its ratio to the ^{27}Al(n,α)^{24}Na and ^{56}Fe(n,p)^{56}Mn cross section in the 14 MeV region, 20:16906 (RA;AT)
The Austrian national radon project (OENRAP), 20:16676 (RA;AT)
The sensitivity of statistical model neutron capture calculations to model assumptions, 20:16901 (RA;AT)
Thermoluminescence dating of sediments, 20:16155 (RA;AT)
Update of the evaluation of the cross sections for the neutron-dosimetry reactions ^{19}F(n,2n)^{18}F and ^{93}Nb(n,2n)^{92m}Nb, 20:16908 (RA;AT)
Uranium-series dating of fossil bones and carbonate speleothems, 20:16152 (RA;AT)

Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Mining and Minerals Engineering
Development of a video-based slurry sensor for on-line ash analysis. First quarterly technical progress report, October 1, 1994–December 31, 1994, 20:14749 (R;US)

Virginia Univ., Charlottesville, VA (United States). Dept. of Mechanical, Aerospace and Nuclear Engineering
Nonlinear stability models and analyses of the nuclear-coupled thermal-hydraulic behavior of boiling water reactors. Interim report, October 1, 1992–May 30, 1993, 20:15382 (R;US)

Virginia Univ., Charlottesville, VA (United States). School of Engineering and Applied Science
Supporting data intensive applications with medium grained parallelism. Final report, July 1991–June 1994, 20:17408 (R;US)

Vissh Massinno-Elektrotekhnicheski Inst., Sofia (Bulgaria)
Operational management of district heating system -artificial intelligence approach, 20:15625 (I;BG;In Bulgarian)

Volkswagenwerk AG, Wolfsburg (Germany). Bereich Forschung und Entwicklung
Development of a test method for determining elastomer tolerance of motor oils for fluorine-carbon elastomers (FKM), 20:16177 (R;DE;In German)

Vortec Corp., Collegeville, PA (United States)
A coal-fired combustion system for industrial process heating applications. Quarterly technical progress report, July 1994–September 1994, 20:15780 (R;US)

Vysoka Skola Dopravy a Spojov, Zilina (Slovakia)
0.9 MV accelerator for materials research at the Slovak Technical University, Bratislava, 20:16346 (IA;CZ)
Calculation of correlation dimension of plasma density fluctuations in CASTOR tokamak, 20:17173 (IA;CZ;In Czech)
Characteristics of neutron-irradiated silicon, 20:16084 (IA;CZ;In Slovak)
Characteristics of z-pinch plasma implosion, 20:17171 (IA;CZ;In Czech)
Determination of light elements in materials using the coincidence method, 20:16144 (IA;CZ;In Czech)
FMR study into changes of magnetic properties of amorphous alloy FeNiCrMoSiB after neutron irradiation, 20:16083 (IA;CZ;In Slovak)
Fragmentation of ^{197}Au nuclei in emulsion at 10.7 GeV/nucleon, 20:16831 (IA;CZ;In Slovak)
Moessbauer spectrometer on PC-AT, 20:16410 (IA;CZ;In Czech)
Moessbauer spectroscopy in quasicrystals, 20:16976 (IA;CZ;In Slovak)
Nuclear analytical methods at the Institute of Nuclear Physics, Czech Academy of Sciences, 20:16146 (IA;CZ;In Czech)
Nuclear interactions of ^{28}Si ions in emulsion at 14.6 AGeV, 20:16830 (IA;CZ;In Slovak)
Phase analysis by Moessbauer spectroscopy, 20:16975 (IA;CZ;In Slovak)
Plasma diagnostics by holographic interferometry, 20:17177 (IA;CZ;In Czech)
Plasma relaxation in flowing afterglow at medium pressures, 20:17175 (IA;CZ;In Czech)
Proceedings of the 11. conference of Czech and Slovak physicists, 20:17312 (I;CZ;In Czech, Slovak, English)
Pulsed and CW NMR study of drawn polypropylene fibres, 20:16977 (IA;CZ)
Quality control of air using nuclear analytical methods, 20:16145 (IA;CZ;In Czech)
Radiation capture of thermal neutrons in ^{124}Te, 20:16889 (IA;CZ;In Czech)
Reflectometry at CASTOR tokamak, 20:17172 (IA;CZ;In Czech)
Search for massive neutrinos in beta decay, 20:16846 (IA;CZ;In Czech)
Study of ^{124}Te(n,γ)^{125}Te reaction with thermal neutrons, 20:16888 (IA;CZ;In Czech)
Study of boundary plasma in CASTOR tokamak, 20:17176 (IA;CZ;In Czech)
Study of iron sulfides in coal using Moessbauer spectroscopy, 20:16147 (IA;CZ;In Czech)
Study of Mars surface using Moessbauer spectroscopy, 20:16143 (IA;CZ)
Three-axis neutron diffractometer for study of residual stresses in polycrystalline materials, 20:16409 (IA;CZ;In Czech)
Tomography at CASTOR tokamak, 20:17174 (IA;CZ;In Czech)

W

Washington State Dept. of Wildlife, Olympia, WA (United States)
Investigations of bull trout (Salvelinus confluentus), steelhead trout (Oncorhynchus mykiss), and spring chinook salmon (O. tshawytscha) interactions in Southeast Washington streams. Final report 1992, 20:15280 (R;US)

Washington State Univ., Pullman, WA (United States). Dept. of Mechanical and Materials Engineering
Predictions of tensile behavior and strengths of a Si_3N_4 ceramic at high temperatures based on a viscoplastic model, 20:15912 (R;US)

Washington State Univ., Richland, WA (United States)
Investigation of polycrystalline thin film $CuInSe_2$ solar cells based on ZnSe windows. Annual subcontract report, 15 February, 1993–14 February, 1994, 20:15297 (R;US)

Washington Univ., Seattle, WA (United States). Dept. of Mechanical Engineering
Suppression of fine ash formation in pulverized coal flames. Quarterly technical progress report No. 9, October 1, 1994–December 31, 1994, 20:14762 (R;US)

West Virginia Univ. Research Corp., Morgantown, WV (United States)
Management, visualization, and analysis of environmental and geotechnical data. Topical report, 20:17409 (R;US)
The economical production of alcohol fuels from coal-derived synthesis gas. Quarterly technical progress report number 12, July 1–September 30, 1994, 20:15271 (R;US)
The economical production of alcohol fuels from coal-derived synthesis gas. Quarterly technical progress report number 13, October 1–December 31, 1994, 20:15272 (R;US)

West Virginia Univ., Morgantown, WV (United States)
Disposal of fluidized bed combustion ash in an underground mine to control acid mine drainage and subsidence. Progress report, September 1, 1994–November 30, 1994, 20:14752 (R;US)

West Virginia Univ., Morgantown, WV (United States). Dept. of Civil and Environmental Engineering
Decontamination systems information and research program. Quarterly technical progress report, October 1–December 31, 1994, 20:16523 (R;US)

Westinghouse Electric Corp., Orlando, FL (United States). Power Generation Business Unit
Advanced turbine systems program conceptual design and product development. Quarterly report, August–October 1994, 20:15370 (R;US)

Westinghouse Electric Corp., Pittsburgh, PA (United States). Science and Technology Center
Advances in tubular solid oxide fuel cell technology, 20:15729 (R;US)

Westinghouse Electric Corp., West Mifflin, PA (United States)
Fabric panel clean change-out frame, 20:16270 (PA;US)

Westinghouse Hanford Co., Richland, WA (United States)
105-KE/KW isolation barrier leak test specification/test plan. Revision 1, 20:15069 (R;US)
183-H Basin Mixed Waste Analysis and Testing Report, 20:15075 (R;US)
1994 tier two emergency and hazard chemical inventory, 20:14981 (R;US)
200 Area treated effluent disposal facility operational test report, 20:15064 (R;US)
200 Area Treated Effluent Disposal Facility Quality Assurance Project Plan, 20:15065 (R;US)
200 Area Treated Effluent Disposal Facility operational test specification. Revision 2, 20:15066 (R;US)
216-Day report for Tank 241-C-111, cores 58 and 59, 20:15094 (R;US)
222-S radioactive liquid waste line replacement and 219-S secondary containment upgrade, Hanford Site, Richland, Washington, 20:14967 (R;US)
340 Waste Handling Facility interim safety basis, 20:15107 (R;US)
45-Day safety screen results for Tank 241-C-103, Cores 63 and 66, 20:15096 (R;US)
45-Day Safety Screen results for Tank 241-TY-104, Auger Samples, 95-AUG-008 and 95-AUG-009, 20:15097 (R;US)
45-Day safety screening report for grab samples from Tank 241-AP-107, 20:15095 (R;US)
A comparison of models to assess the atmospheric dispersion of resuspended radionuclides on the Nevada Test Site, 20:16517 (R;US)
Acceptance test procedure for the 241-SY-101 flexible receiver gamma detector system, 20:15086 (R;US)
Acceptance test procedure for the ultra high pressure bore head for use in the self-installing liquid observation well, 20:15088 (R;US)
Acceptance test procedures for rotary mode core sampling exhausters, 20:15085 (R;US)
Acceptance Test Report for 241-SY Pump Cradle Hydraulic System, 20:15089 (R;US)
Acceptance test report for the Westinghouse 100 ton hydraulic trailer, 20:15193 (R;US)
Analytical services contract reform alternatives project, 20:15196 (R;US)
Assembly procedure for column cutting platform, 20:15112 (R;US)
Assembly procedure for Shot Loading Platform, 20:14946 (R;US)
Automated Transportation Management System (ATMS) V2.0 logistics module PBI acceptance criteria, 20:14945 (R;US)
Basis for criticality category B firefighting designation for K Basins. Revision 1, 20:14941 (R;US)
Buckling of the Tank 241SY101 primary liner, 20:15099 (R;US)
Cathodic protection acceptance test procedure, 20:15077 (R;US)
Choices of canisters and elements for the first fuel shipment from K West Basin, 20:14943 (R;US)
Clean salt disposition options, 20:15102 (R;US)
Closed out Tank 241-SY-101 DACS system change request #1–100, 20:15194 (R;US)
Closed out tank 241-SY-101 DACS system change requests No. 101-200, 20:15091 (R;US)
Closed out tank 241-SY-101 DACS system change requests No. 201-300, 20:15092 (R;US)
CNS 1-13G Cask lid support frame structural analysis, 20:15594 (R;US)
Compatibility Grab Sampling and Analysis Plan, 20:15126 (R;US)
Compilation of formal comments on the tank farms interim hazard and accident analyses, 20:15117 (R;US)
Compressed air piping, 241-SY-101 hydraulic pump retrieval trailer, 20:15093 (R;US)
Computer software configuration management plan for 200 East/West Liquid Effluent Facilities, 20:15063 (R;US)
Computer software user document for Employee Position Requirements Tracking System (EMPORTS), 20:17441 (R;US)
Control system troubleshooting guide for the 300 area treated effluent disposal facility, 20:15061 (R;US)
Core sampling system spare parts assessment, 20:15101 (R;US)
Criticality classification of enhanced radioactive and mixed waste storage, 20:15076 (R;US)
CSER 90-006, addendum 1: Criticality safety control for source term reduction project in the scrubber glovebox of Building 232-Z. Revision 1, 20:16283 (R;US)
CSER 95-002: ALARA shielding for IAEA SNM container movement, 20:14944 (R;US)
Data quality objectives for PUREX deactivation flushing, 20:15188 (R;US)
Design Reconstitution Program Plan and procedures for K Basins, 20:15067 (R;US)
Design review report for the 105 K-East Basin dose reduction concept. Volume 1, 20:15593 (R;US)
Design Review Report for the 105 K-East Basin dose reduction concept, Volume 2, Review Package, 20:15190 (R;US)
Design support document for the K Basins Vertical Fuel Handling Tools, 20:14942 (R;US)
Electrical classification for the single shell flammable gas watch list tanks, 20:15195 (R;US)
Engineering task plan for BX/BY compressor upgrade, 20:15103 (R;US)
Engineering Task Plan for inspection of double shell tank farm exhaust ducts, 20:15106 (R;US)
Engineering Task Plan: PUREX cathodic protection system survey and maintenance, 20:15105 (R;US)

Final report on fiscal year 1994 activities for the line loss study, 20:15151 (R;US)
Final report: Fiscal Year 1993 activities for the Line Loss Study, 20:15150 (R;US)
Glass science tutorial: Lecture No. 4, commercial glass melting and associated air emission issues, 20:15798 (R;US)
Groundwater monitoring plan: 200 Areas treated effluent disposal facility (Project W-049H), 20:16570 (R;US)
Hanford site comprehensive site compliance evaluation report, 20:15058 (R;US)
Hanford Wells Integrity Inspection Plan for the ROM Program, 20:15057 (R;US)
Hazard categorization of 100K East and 100K West in-basin fuel characterization program activities. Revision 1, 20:15191 (R;US)
Hazardous material reduction initiative, 20:15052 (R;US)
Integrated test plan for demonstration of a prompt fission neutron logging tool, 20:16569 (R;US)
K-Basins debris removal equipment - test plan, 20:15070 (R;US)
KW basin backwash pit sludge measurement/video, 20:15111 (R;US)
LLW solidification in cement: Effect of dilution, 20:15053 (R;US)
Load test of the 306E Building roof deck and support structure, 20:15062 (R;US)
Long term decontamination at the Hanford Site: A case study, 20:15055 (R;US)
Microstructural aspects of zeolite formation in alkali activated cements containing high levels of fly ash, 20:15054 (R;US)
Multi-function Waste Tank Facility Qualification and Training Plan, Project W-236A, 20:15080 (R;US)
Nitrogen chiller acceptance test procedure, 20:15087 (R;US)
Operability test procedure for the TK-900 beta/gamma liquid effluent monitoring system, 20:15152 (R;US)
Operability Test Report for 241-T compressed air system and heat pump, 20:15108 (R;US)
Operability Test Report for 241-U Compressed Air System and heat pump, 20:15109 (R;US)
Operating and maintenance instructions for the Hedgehog sample package (A DOT 7A Type A Package), 20:16284 (R;US)
Packaging and transportation of radioactive liquid at the U.S. Department of Energy Hanford Site, 20:14938 (R;US)
Performance assessment of grouted double-shell tank waste disposal at Hanford. Revision 1, 20:15098 (R;US)
Performance testing of a system for remote ultrasonic examination of the Hanford double-shell waste storage tanks, 20:16282 (R;US)
Plan and schedule for disposition and regulatory compliance for miscellaneous streams. Revision 1, 20:14976 (R;US)
Plant Acquisition Plan: Multi-function Waste Tank Facility. Revision 2, 20:15078 (R;US)
Plutonium finishing plant final safety analysis report. Volume 1, 20:14939 (R;US)
Plutonium finishing plant final safety analysis report. Volume 2, 20:14940 (R;US)
Preliminary Fire Hazards Analysis for W-059, B Plant canyon ventilation upgrade, 20:16285 (R;US)
Preliminary Hanford technical input for the Department of Energy programmatic spent nuclear fuel management and Idaho National Engineering Laboratory environmental restoration and waste management programs environmental impact statement, 20:15186 (R;US)
Project W-340 tank 241-C-106 manipulator system closeout summary, 20:15082 (R;US)
Quality assurance program plan for the Site Physical and Electrical Calibration Services Lab. Revision 1, 20:15189 (R;US)
Quality Assurance Project Plan, W-026. Revision 1, 20:15074 (R;US)
QUEST2: Project plan for preliminary analysis/system architecture phase (PA/SA), 20:17440 (R;US)
QUEST2: Release 1: Project plan deliverable set, 20:15669 (R;US)
Radioactive air emissions notice of construction Sodium Storage Facility, 20:15453 (R;US)
Recommended test program to determine crack growth rate in double-shell tank materials, 20:15104 (R;US)
RMCS exhauster data logger configuration, 20:15114 (R;US)
Safety evaluation for packaging transfer of 101-AZ thermocouples, 20:15072 (R;US)
Safety evaluation for the interim stabilization of Tank 241-C-103, 20:15116 (R;US)
